HOW MICHIGAN IS SUPPLIED WITH POWER

(See Page Three for Table of Contents)

Vol. 27. No. 1 *Price Fifteen Cents*

ESTABLISHED NINETEEN HUNDRED SEVEN

No Engine Is More Efficient Than Its Cooling System.

WHEN you select the *Long Cooling System*—with its 19 years of *positively proved efficiency*–you are following the successful experience of many manufacturers. These manufacturers submitted their requirements and radiation problems to our specialized radiation engineers, who overcame all difficulties in advance.

Our purpose, our organization, our production facilities are concentrated upon *one thing only*—ridding the automotive industry of all radiation annoyances and needless expense.

Special designs, maximum efficiency and minimum cost comprise our slogan and maintain the Long Cooling System in its position of merited leadership.

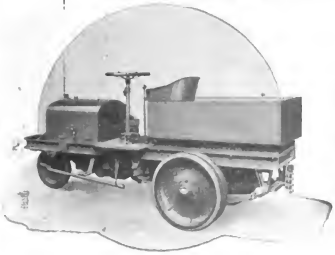
Reduce Handling — Lower Costs

Every pair of hands, arms and legs you relieve from handling, lugging, wheeling or hauling material from place to place, is immediately available for real productive work.



The Mathews Gravity Conveyor is readily adaptable in any manufacturing plant or yard—

will carry heavy or light loads over, under or around obstacles—straightaway—from floor to floor—

And the upkeep is negligible.

The Motive Power is GRAVITY

The Clark Tructractor is specially designed for industrial service—

for factory and plant haulage. Is "all steel" construction, amply powered, with a speed range from ¼ to 12 miles per hour under full load.

Can be used as a unit, or will tow from one to a dozen trailers.

A Tructractor will lower haulage costs—relieve aisle congestion—shorten distances—operate economically.

How Michigan Is Supplied With Power

Modern Methods of Production and Distribution As Developed in This "Machine Shop of America"

By HOWARD CAMPBELL

THE AVERAGE PERSON turns the electric light on and off, rides down town on the trolley car, shoots up fifteen or twenty stories in an elevator, practically without a thought of the miracle of power, the production and transmission of which have made these things possible.

Power is the first necessity in the operation of a manufacturing plant; power is the prime requisite in the operation of an electric railway; power alone makes possible electric light. Take away the ability to generate and transmit power, and the world would be turned backward to the time when all metal working was done by hand—when the stagecoach was the only method of transportation and when the best artificial light known was produced by oil lamps.

In the earlier days of our industrial history power was used almost entirely for manufacturing purposes. The location of industrial enterprises then was largely determined by power sites, and the settlements which have since become great cities were the first manufacturing communities. With the development of steam power and better transportation facilities, the controlling influence was transferred and the determining factor became either the accessibility of raw materials or labor or a market for manufactured products. The introduction of electric power transmission has again revolutionized this situation, opening up entirely new power fields and enormously increasing the importance of water power.

The three principal demands for power are for lighting, traction and manufacturing. And in place of each factory and mill having its own power and lighting plant, as was formerly the custom, the tendency of late years has been toward "central stations," or plants which produce electricity for sale. Such centralization makes possible the production of power on a gigantic scale, and with power as with everything else, increased production means reduction in cost per unit, which in this case is a kilowatt hour. Thus power can be sold to the consumer at a rate which is usually less than it would cost him to produce it himself, besides saving the initial cost of equipment and construction of a power house, the space which would be occupied by the buildings, coal storage, cranes and other equipment and relieving him of the responsibility of maintenance. In a number of instances power has been furnished the consumer at a cost which was not much greater than his coal alone would have cost him for an individual power plant. And as a rule the cost of the coal comprises from 50 to 60 per cent of the total cost of operation of the plant of average size. Another item of interest is this: Since the war started, the price of steam coal has advanced nearly 400 per cent, while the cost of central power has increased only about 25 per cent. In the city of Detroit alone the use of central power has increased much more rapidly than the growth of the city. The population of Detroit increased 1.6 times in the ten years from 1904 to 1914, while the amount of power required to serve the people of Detroit increased 21.4 times.

The Brush Electric Light Company, which was formed in 1881, began in September of that year to operate series arc-lighting circuits connected to lamps hung outside of stores on lower Woodward avenue, Detroit. In 1883 it contracted with the city for street lighting according to the Brush system. In 1891 the Peninsular Electric Light Company, succeeding the Brush Company, began the supply of incandescent lighting by alternating current.

In the meantime the Edison Illuminating Company, Detroit, was organized April 15, 1886, under Michigan laws, for the purpose of operating the Edison system of direct current lighting and power in the city of Detroit. It began in November of the same year to deliver current through an underground network of Edison tubes serving the central business area of the city. In 1898 the Edison Illuminating Company took over the management of the Peninsular Electric Light Company and began the extension of its lines, supplying alternating current for all purposes throughout the city and adjacent villages.

The Detroit Edison Company was organized in 1903, and immediately purchased all the securities of the Edison Illuminating Company and the Peninsular Electric Light Company. The great expansion of electric light and power service in southeastern Michigan dates from that year. The earnings of the company have grown from $534,000 in 1903 to approximately $15,000,000 in 1919.

The equipment of the Detroit Edison Company, which serves the southeastern part of the state, includes two steam-electric plants in the city of Detroit and six hydro-electric or waterpower stations on the Huron river. The waterpower plants operate regularly in synchronism with the Detroit plants and feed into the general system.

The Conner's Creek power station of the Edison company is an excellent example of a modern steam power plant. The equipment consists of six steam turbines, fed by 14 boilers.

Next Week:

Getting the Power to the Machine

In the article which begins on this page, and which is the first of a series of 52, Mr. Campbell discusses the production of power in Michigan. In next week's article he takes up the methods by which this power is applied to the wheels of industry. This article will be illustrated with photographs taken in Michigan plants.

Ford 6,000 Horsepower Steam-Gas Unit. Showing 100-ton Flywheel and Generator.

These boilers are of the Stirling "W" type, rated at 2,365 horsepower each, and each boiler is calculated to generate 70,000 pounds of steam per hour at this rating. The engineers estimate that eight pounds of steam are available from each pound of coal used; therefore 70,000 pounds of steam means the consumption of four tons of coal per boiler per hour. As a matter of fact, these boilers are operating at 175 per cent of rating, using six and one-half tons of coal per hour.

From the time the coal enters the plant until the "juice" leaves it, the entire operation is mechanical. The coal enters the train shed in drop-bottom cars from which the coal is dumped into hoppers, one hopper serving each unit of two boilers. A motor-driven flight conveyor with a capacity of 120 tons per hour receives the coal from the hopper, carries it up an incline and discharges it into a motor-driven crusher of similar capacity, where it is broken into pieces small enough to go through a 1 3-4-inch mesh. The crusher discharges directly into a motor-driven lapping bucket conveyor which carries the coal up and discharges it into any one of the three coal bunkers which serve the two boilers of one unit. From the bunkers it descends by gravity to the stokers. The latter are Taylor under-feed, with 26 retorts per furnace arranged in two groups of 13 each, the furnace being fired from the two ends. Ashes and clinkers are discharged into the ash hopper below the furnace, being finally dropped directly into standard railroad cars, which run lengthwise of the building directly under the ash hoppers. The stokers are chain-driven by direct current motors, the speed of which can be varied from 200 to 2,000 R. P. M.

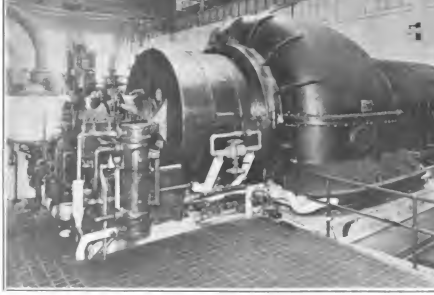
Blowing and Cleaning

Buffalo motor-driven blowers supply the air needed for combustion, each blower being designed to deliver at maximum 74,000 cubic feet of air per minute. The speed of the motors can be varied from 300 to 750 R. P. M. Steam pressure is kept at the desired point by regulating the speed of both stokers and blowers. The boilers each have 23,654 square feet of water heating surface and are built to operate at 225 pounds pressure per square inch.

The old-fashioned method of cleaning flues by inserting a hose through the hand-holes, one at a time, and blowing off the soot, has been supplanted with the "Diamond Soot Blower" method, a blower being installed on each boiler. A soot blower is in the nature of a set of tubes, open at the inner end and connected with the steam line, with the valve on the outside. When this valve is opened, steam is admitted, blowing out the flues quickly and efficiently. This is done while the boiler is in operation.

The power plant consists of one 10,000, two 20,000, one 30,000 and two 45,000 kilowatt General Electric turbo-generators. The 20,000 K. W. machines run at a speed of 1,200 R. P. M. and generate at 4,800 volts. The 45,000 K. W. machines also run at a speed of 1,200 R. P. M. but generate at 12,200 volts. The capacity of the plant under full load is approximately 170,000 kilowatts per hour and is distributed to the various substations by means of an underground conduit system of cables carrying 24,000 volts each. It has been found impractical to carry heavier voltage than this underground, and overhead high tension cables are impossible in the city.

There are, however, a great many industries in the state which are operating under their own power for various reasons. Some of these plants are too far from the central power lines to make the use of central power a practical proposition, some of them had their own power plants before power centralization became so well developed, and some (like the Ford Motor Company) prefer to remain as far as possible independent of all outside factors.



As an example of a private power plant, the Ford stands unique. The standard generating unit which furnishes the power with which the Ford factory is operated is a composite gas-steam engine rated at 6,000 horsepower, the gas side having tandem cylinders 42 by 72 inches, and the steam side tandem-compound cylinders 36 and 68 by 72 inches, Between the two engines are mounted a 100-ton flywheel and a 4,000 K. W. 250-volt direct current generator. The latter is of unusual size owing to a speed of 80 R. P. M. The gas engine is a four-cycle reciprocating engine operating on producer gas. One engine uses 150,000 cubic feet of gas per hour under normal load, the whole battery of machines, of which there are nine, using on the average 1,530,000 cubic feet per hour, or 28,000,000 feet per day of 24 hours. Although the engines frequently use 2,000,000 feet per hour, the load is considerably lessened during the night while only part of the factory is in operation, thus reducing the amount of gas required.

The Ford Power Plant

Gas is supplied from equipment consisting of 30 sections of type M-B Smith producer plants, a section consisting of two units each capable of gasifying two tons of coal per hour and supplying 5,000 cubic feet of gas per minute having a heat value of 165 B. T. U. per cubic foot. A Smith gas producer is shaped like a huge cylinder, being 16 feet in diameter and approximately as high. Coal is supplied through an opening near the top of the producer, and the bottom layer is ignited. Then more coal is fed in on top of this, but only the bottom layer is allowed to burn. Thus the upper layers are heated to the point required to generate gas, and this gas is drawn off and supplied to the engines. Approximately 500 tons of coal per day are used in the production of gas.

The steam engine is of the tandem compound type, using 40,000 pounds of steam per hour at 600 degrees temperature. The high pressure cylinder has a 12-inch steam connection and 8-inch connections to the jacket through which the exhaust from the gas engine is received.

Steam is supplied from seven Badenhausen boilers, seven Wickes boilers and one boiler similar in design to the Badenhausen boilers though erected by the Ford company, all of these boilers being served by Taylor underfeed stokers. The Badenhausen boilers each have 25,000 square feet of heating surface and

Forty-five Thousand Kilowatt General Electric Generator in the Detroit Edison Company's Conner's Creek Plant.

Digitized by Google

are rated at 2,000 horsepower. Steam is generated at 180 pounds pressure and superheated to 600 degrees. Each boiler is served by a 12-retort stoker of especially large size driven by a variable-speed motor with a range of from 300 to 1,200 R. P. M. The Wickes boilers each have 4,000 square feet of heating surface and are equipped each with a 4 retort stoker driven by an individual vertical engine mounted on a base at the side of the stoker. Steam is generated at 180 pounds pressure and superheated to 600 degrees, the superheater being of the same type as those employed in the larger boilers.

Coal is brought in by rail over a siding to the coal storage house, where it is dumped into a track hopper having a capacity of 800 tons. From the track hopper the coal passes to a conveyor, motor-driven at a speed of 37 feet per minute and having a capacity of 150 tons per hour. A cross-conveyor receives the coal and delivers it to the crusher, whence it is conveyed to the bunkers. Automatic weighing machines record the weight of the coal before it is discharged into the stoker magazine.

Consumers Company Service

The Consumers Power Company is utilizing the water powers of the state as far as possible, having at present 20 hydraulic, or water-power plants, located on several of the largest rivers of the state. These 20 plants, together with the 12 steam plants which are a part of the system, are capable of delivering approximately 202,000 horsepower, which is distributed through 77 substations throughout Michigan, furnishing electric power for the operation of hundreds of factories, shops, electric railways and various other kinds of machinery, down to the washing machine and electric flatiron in the home.

The Consumers Power Company was incorporated April 12, 1910, uniting a number of smaller independent companies. The Michigan Light Company was incorporated in December, 1913, and early in 1920 was consolidated with the Consumers Power Company through stock purchase.

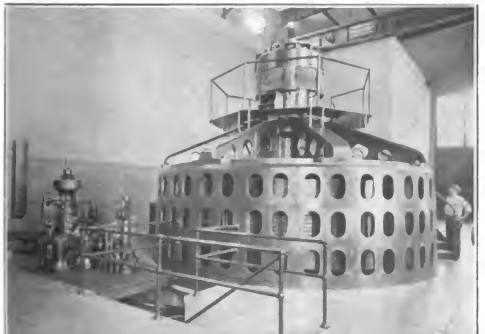
Junction Dam Power House on the Manistee River. (Consumers Power Company.)

This corporation supplies electricity as power or light (or both) to 89 municipalities in 29 Michigan counties having a population of 800,000, comprising 64 per cent of the urban population of lower Michigan, including the ten largest cities in the state outside of Detroit.

Five of these waterpower plants are located on the Au Sable river, two on the Manistee, two on the Muskegon, one on the Shiawassee, four on the Grand and six on the Kalamazoo. Thus the natural resources of the state are harnessed and a vast amount of energy which for hundreds of years went to waste is now made to run factories, lift elevators, operate street cars and do the thousands of other tasks which are necessary in this day and age.

The utilization of the water powers of the state is going far toward solving what has come to be regarded as one of the severest problems of the day—that of obtaining fuel. When it is known that in the year 1919 the amount of power generated by the hydraulic plants of the Consumers Power Company was equal to the power in 306,000 tons of coal, one begins to realize the importance of such service to Michigan industry.

The Consumers Power Company has undeveloped resources consisting of water power facilities aggregating a fall of 880 feet and about 200,000 h. p. on 28 dam sites lying along the Au Sable, Muskegon, Manistee, Grand and Kalamazoo rivers. The land comprising these sites totals 60,000 acres. What this would mean to the people of Michigan may be gathered from the statement that this 200,000 h. p. yet undeveloped would be equal to about 750,000 tons of coal a year.



The extent of the growth of the use of central power in this state is evident when it is known that the gross earnings of the company have grown from $4,726,000 in 1914 to $11,440,000 in 1919. This, of course, includes the revenue from the gas plants, of which seven are owned by this company. On the first of July, 1920, this company was serving electricity to 110,775 customers, including 2,000 manufacturing plants which employed 170,000 workers.

The Transmission of Power

An important item in the manufacture of power is the transmission of this power to the markets. The hundreds of miles between the plants and the consumers have to be spanned, and done in such manner that the connection will be safe from the elements. And the system of transmission must be such that the energy generated at the power plants will not be dissipated in forcing its way through the conductors. One hundred and forty thousand volts has been adopted as a standard transmission voltage, and this requires copper cables just a trifle less than half an inch in diameter. These cables are supported by steel towers spaced about ten to the mile and extend from the power plants to the various points of distribution and consumption. The entire system of heavy voltage transmission spans a distance of more than 1,200 miles.

It is obvious that electric current at 140,000 volts is too near the texture of lightning to be used for any ordinary purpose; hence substations are erected at the points of distribution containing transformers which reduce the

The Double Cross in Seattle

Radicals, Professing Support of American Plan, Play Judas, But Deception Is Discovered in Time

SEATTLE is the home of the American Plan of Employment.

Out of a turbulent period of strikes, riots, radicalism and bloodshed, the result of a deliberate attempt on the part of the then leaders of Seattle organized labor to establish the soviet form of government upon American soil, and which resulted in the city's gaining the reputation of being the worst hotbed of bolshevism in this country, Seattle emerged an open shop city.

The story of Mayor Ole Hanson's militant tactics in dealing with the rebellious element is well known. The formulation and adoption of the American Plan by the Associated Industries of Seattle is likewise familiar, for the plan has spread from coast to coast, and is in force in Detroit. But Seattle, the home of the American Plan, is not entirely "out of the woods," and it is not generally known how the radicals, temporarily defeated, came back with a terrific wallop by double-crossing the Seattle Chamber of Commerce and the Associated Industries.

In every community where the rank and file of organized labor still permits radical leadership to dominate and is either ignorant or indifferent to the "boring within," which is the policy of bolshevism's official and self-appointed agents, and where employers are still inclined to bargain with organized labor's agents rather than take a united stand under the American Plan or some equally effective plan, the story of the double-crossing of Seattle's industrial and commercial leaders carries a warning.

Why the Plan Was Adopted

The American Plan was adopted in Seattle as a means of protecting the building industry against vicious practices of vicious leaders in the building trades. It was not an attempt to throttle labor organization nor to prevent collective bargaining. All the promoters of the American Plan asked was that labor leaders desist from interfering with the right of all workers to sell their labor where and upon what terms they desired.

If a building employer preferred to hire union men, that was his business, but because he employed union men was not to be considered sufficient reason for union leaders to persecute employers of non-union men, or the non-union men themselves. The radical wing of labor was determined that Seattle should be a closed shop city, but the real object of the campaign was to take complete control of the building industry in the city from the owners and place it in the hands of the union leaders. The success of this program would have reacted as harshly against the union membership as it would have against the owners, but that the more conservative union men were prone to see.

After the smoke of battle had cleared away and the American Plan became recognized, the building situation improved and Seattle settled back confident that a worth-while victory had been achieved. Seattle's success in putting over the American Plan was spread broadcast over the country. Either Seattle employers were over-confident or they were not voicing their fears of a possible "comeback." At any rate, it was not long before they awoke to the realization that they were not "out of the woods"—that the radicals were not whipped. They merely were awaiting the psychological moment to execute a coup; and it came, and this is the way it developed:

During the long period of warfare between employers and organized labor, radicalism in the Northwest, in which the general public suffered equally with the belligerents, there developed a desire for a neutral organization which could investigate conditions and express the public will. In Seattle the Chamber of Commerce and Commercial Club was appealed to for aid in forming some such organization. As a result, a Committee on Labor Relations was formed to function independently of all bureaus and other organizations interested in the same subject. This committee was to view the whole situation from a middle ground, conduct such research work as was necessary and compile and submit its findings to the trustees of the Chamber of Commerce.

After several months of work the committee submitted a voluminous report from the standpoint of the general public. The committee carefully avoided holding briefs for either employers or employes. The members of the committee were not employers of labor but professional men and inclined to be liberal rather than conservative.

When the report was ready it was suggested that copies be sent to the officials of the Seattle Central Labor Council and the Washington State Federation of Labor. When this text was submitted, bars were embodied, and their constructive spirit is appreciated by this committee. This shows a willingness to pull together now and work out a practical solution for industrial harmony."

Having established confidence in the minds of the committee members, the radicals then proceeded to spread by the underground route the report that the building employers had decided to abandon the open shop program and tie up with the unions. They also announced that the Associated Industries, the organization formed to combat labor, was soon to be disbanded, and that the Chamber of Commerce would thereafter represent the employers and would work with the Labor Temple.

The conspiracy was well under way and the report of the special committee was published before the Chamber of Commerce awoke to the fact that it had been made the victim of an ingenious plot. The daily papers carried only extracts from the report which could be construed in almost any way a biased person desired.

The Central Labor Council's official newspaper, The Union Record, immediately began a front page campaign of misstatements, among them the following:

"Open shop capital's war on labor and the community as carried out by the Associated Industries has ceased in Seattle. . . . With the adoption of a report calling for conciliation between employers and workers the 26 trustees of the Chamber of Commerce by unanimous vote have uttered a call for a new order of things in this city's industrial life. . . . The Associated Industries retires from the stage. . . . Not only does the Chamber intend to speak in future for the employers of the community instead of the Associated Industries, but that body places itself on record in favor of many things that labor has been denounced for advocating. . . . An end to the bitter strife which has torn the city since the Seattle general strike looms now with the new attitude of Seattle capital. . . . After 20 months of expensive, exasperating and destructive adherence to the policy laid down by the Associated Industries, the same portion of the business and industrial community has announced a desire for a change in tactics. . . . Evidently realizing that a continuance of the ill-advised policy of the Associated Industries could only lead to financial, commercial and industrial ruin, the same portion of the business world has again taken the reins into their hands. Speaking through the Chamber of Commerce, a new program has been announced.

"The capitalists see their doom in the coming election. They realize that Hanson and the whole Farmer-Labor ticket will be elected. They are deserting the Associated Industries like rats leaving a sinking ship. The workers have triumphed. The unions are again the dominant force in Seattle industry. The Chamber of Commerce is panic stricken and has come running to the Labor Temple for aid. Within 20 days every open shop plant in Seattle will sign up with the unions. You fellows had better get in out of the wet. Just as your bosses are doing. Get in while getting is good. When your boss signs up with the unions you will be without a job. The only way to save yourself is to take out a union card and help labor lead to win the election, and we are going to run things in Seattle and all over the state, and this won't be a very healthy place for you unless you are one of us."

Labor leaders then began a spirited campaign to bring back into the organization fold those members who for one reason or another had left, and to advise those workers who had never enjoyed membership immediately to get "under cover" while the getting was good. Naturally there was a grand rush by such workers who feared rather than respected the union organizations as they were being conducted, and Seattle was in a fair way to see its American Plan structure fall in a heap.

The Chamber Comes Back

The Seattle Chamber of Commerce lost no time in endeavoring to make plain its position, the following statement being issued:

"In view of misstatements made by the Union Record October 11 that the Seattle Chamber of Commerce and Commercial Club has attempted to supplant the Associated Industries of Seattle and that the report of the Labor Relations Committee of the Chamber of Commerce discredits the work of the Associated Industries the trustees of the Chamber of Commerce take this occasion to state that the service rendered and now being rendered the community by the Associated Industries has made it feasible the consideration of its own program.

"But for the fearless stand of the Associated Industries during the Seattle general strike industrial life, this report could not have been presented to the public, and, furthermore, let it be understood there is no intention on the part of the Chamber in any way to disband them or be policies and aims heretofore followed and now pursued by the Associated Industries in this public activity, or to supplant the Associated Industries in its work.

"It is to be recalled that the Chamber has been at one time on record overwhelmingly in favor of the American or open shop plan of industrial relations and still unalterably committed, with the Associated Industries, to this just and fair principle.

"Further evidence of the declaration of principles put forth by the Associated Industries and the letter by the then president, Mr. Frank Waterhouse, accompanying it, met with instant approval, not only in this community but throughout the country. And the reason for this is plain. It stands for even-handed justice to employer and employe alike. That is why it has commended itself to all fair-minded people at home and abroad.

"But the Associated Industries did not stop there. With intelligence and courageous fidelity, beyond all praise, they put those principles in practice, and in 18 months the industries have

Rail Board Protest Meeting on January 12

The demand of the Railway Brotherhoods that a National Board of Adjustment shall handle all labor problems instead of the individual company settling its own troubles, as formerly, will be protested at a convention of manufacturers, merchants, railway executives and shippers, at Chicago, January 12. About 500 delegates, representing all sections of the country, are expected to attend the meeting, which will be held at the Congress Hotel.

Acquiescence in the Brotherhoods' plan would mean the opening wedge for collective bargaining and the closed shop in all branches of American industry, according to the convention call issued this week by the National Conference of State Manufacturers' Associations, through its president, William Butterworth. In explaining the primal purpose of the convention the call says, in part:

"The Railway Brotherhoods are insisting upon the creation of a National Adjustment Board. The railway executives are opposing it because, if created, it means the nationalization of railways under the domination of the labor unions, and the destruction of discipline, efficiency and loyalty, which are necessary to the efficient and economical operation of the common carriers for the benefit of the people. If the railroads are thus shackled, the resulting conditions must necessarily be reflected in the organization of every manufacturer. It means the closed shop and union domination over all industries alike. This, today, is perhaps the most vital issue facing the manufacturing and producing interests of the United States, and should have immediate attention."

A discussion of the open shop, its effect on employe, company, production, cost of production and union labor is also scheduled. The immigration problem, particularly vital at this time, will be considered in all its phases. Many prominent men have been invited to address the convention, including Elbert H. Gary; Charles M. Schwab; Dwight W. Morrow, J. P. Morgan & Co.; A. Barton Hepburn, Chase National Bank; W. W. Atterbury, vice-president, Pennsylvania Railroad company; Charles Nagel, former secretary of Commerce and Labor, St. Louis; John D. Ryan, Anaconda Copper Company; P. A. Seiberling, Goodyear Tire & Rubber Company, and Charles Piez, president Link-Belt Company, Chicago.

Howell to Greet New Year With Industrial Revival

The city of Howell approaches the New Year with considerable enthusiasm as a result of promised industrial activity. The annual meeting of the Board of Commerce will be held January 12, at which a special program bearing on civic betterment will be provided. The speakers will be Mayor Sutton, Rev J. S. West, Superintendent of Schools Coulter, County Agent Douglass, H. L. Williams, Charles Norton and Wilson Howlett.

The work of constructing the Howell Foundry Company building is being pushed as rapidly as possible in an effort to begin operations before spring. Plans are being made for reopening the plant of the Howell Washing Machine Company. John Randall, engaged in the glass cutting business, has arranged to turn his business over to a stock company, which is to be formed with a view to enlarging the enterprise.

After a period of inactivity the plant of the Borden Company has been reopened and a large quantity of milk is being canned. The Howell Electric Motors Company is established in its new plant.

STRAIGHT LINE METHODS

Business Graphics

If you would make Figures talk, Chart them

Graphic Charts are moving picture stories of business activities. They are figures—illustrated. They picture the vital facts of your business, as those facts are revealed by figures—compare them, weigh them, measure them.

Graphic Charts illuminate the most complicated problems. Their logic is the logic of mathematics. They are simple. They interest. They convince instantly.

The value of your Graphic Charts depends on the just application of correct figures and the use of correct chart forms. Perfect accounting must be their base.

Only expert accountants, trained in engineering principles and with long experience in Graphics, may be entrusted to set these vital business pictures. Prepared by novices, Graphic Charts are misleading—untruthful—dangerous.

In this connection:—

Conditions Better—Metzger

Detroiter, Pioneer of the Automotive Industry, Summarizes Favorable Indications of Last Few Weeks

IN THE fastest thinking and snappiest acting nation in the world an industry like that which has made the motor car a necessity, a utility and a universally desired mechanical convenience cannot long remain dormant. The foundation of this industry has been too well laid and the need of every efficient facility for transportation is too great and too widespread to permit of its successful repression.

"The two requirements necessary to reestablish all business, including that of the motor car industry, are the adoption of every fair means to keep merchandise moving for the next two or three months, and lay plans for future business within the next year. Much of the responsibility of properly guiding business through this difficult period rests with the retailer, and the wisdom and energy he displays now in handling his business will influence industrial and mercantile activities."

The two foregoing paragraphs are from a message to the automotive industry from one of its pioneers, William E. Metzger, Detroit, director of the National Automobile Chamber of Commerce, and one of the men responsible for the remarkable success of the Columbia Motors Company. Mr. Metzger has been through more than one crisis in the industry and bespeaks an optimism based upon his experience.

"There is nothing mysterious or alarming about the present situation," he says. "We and all other countries are paying for the world war. It caused a tremendous waste of men and money, effort and resources, and all that waste must be paid for. Just as it takes a man who has been ill almost to the point of death a long time to recover, so it will take the world time to recover. Some countries will recuperate more quickly than others because they were not so hard hit by the war and because they have the tremendous natural resources for the creation of new agricultural and manufactured wealth that will make their convalescence not only easy but quick. Such a one is our country."

Mr. Metzger believes that, because the snap and go which is characteristic of American life, the desire to own a motor car is inbred in every American. The longer the present repression of this desire exists, the greater will be the reaction, for the desire has not been affected.

"The result of decreased demand for almost every kind of product has been and will continue to be liquidation. It is apparent everywhere," Mr. Metzger says, and points to the decline in demand for copper, cotton, food products, wool, silk and leather, and to the subsequent price reductions necessary to gain liquidation. And he believes that in some essential commodities the period of liquidation has about run its course. "It is from just such conditions," he asserts, "that recoveries develop into booms. When the world decides to begin buying, it will buy as it never has before."

Mr. Metzger sees the signs of a coming turn for the better, regarding which he says: "We have passed through a period of high money rates and have just witnessed the first material break in call and time money in New York. Call money has fallen from about 9 to 6 per cent and time from about 8½ to 7 and 7½. It will not be long before lower money in New York will be reflected in lower rates all over the country.

"Another very favorable sign is that which comes from our Federal Reserve System. For months after month it had to grapple with the problem of continued note expansion. Only recently came the first break, with a reduction in demand for new loans or the continuation of old ones. Now for the first time the system shows a progressive reduction in outstanding loans. The New York clearing house has shown the sixth successive decrease in loans since October 16, total contraction since that date aggregating $283,000,000. A slow upbuilding of the reserve system strength is noted throughout the country.

"Practically all the great banks in the country are agreed that the peak of the credit situation has passed. One of the foremost economists a few weeks ago forecast that 1921 would be a year of easy money. His prediction is making good. The greatest bank in the country has issued a statement saying that better business is on the way. A great Chicago banker looks for a business boom in the early spring. Men and concerns such as these do not make predictions just because they like to make predictions, but because they know what they are talking about.

"Now getting back to the automobile business for a moment. Production has been curtailed for several months. Every day of lessened production, or production that merely keeps pace with present sales, means a scarcity of automobiles when the demand revives, which I feel sure it will do in the spring, and perhaps sooner. I feel sure that the automobile shows will strike an emphatic note of better business, and it should be the duty of everyone in the trade, from office boy up, to get such an outpouring of people to the shows this winter as we have never seen before. Just as the reserve stock of automobiles is being wiped out by underproduction, the same is true in many other lines of manufacture.

"When conditions get just a little bit better and the climb toward normal begins, manufacturers in all lines will have to supply merchandise not only with immediate requirements, but build up surplus stocks for the future.

"Improved conditions are here. Better times are very near. As business picks up there will be more sales for merchants and more work for working men. And when business gets back to nearly normal there will be plenty of sales and plenty of work, but there will be no room for shirkers for a long time to come. Next year will be a truly happy one for all of us."

ACCOUNTANTS MEET THIS MONTH

Richard Fitz-Gerald, of Lybrand, Ross Bros. & Montgomery, and who was named chairman of the new Detroit section of the National Association of Cost Accountants, at a recent meeting at the Board of Commerce, has completed the personnel of the organization committee, which is composed of the following: E. E. Staub, Hudson Motor Car Company; Maj. William Butler, Fisher Body Corporation; A. C. Brown, General Motors Corporation; S. C. Guthrie, Hinkley Motors Corporation, and R. W. Busse, E. C. Little Tax Bureau. The second meeting of the Section probably will be held the second week in January.

BYLLESBY OFFICES FOR DETROIT

H. M. Byllesby & Company, engineers, Chicago, have opened Detroit offices at 1614 Dime Bank building. Thomas E Flanegin is the resident manager.

Clark Art Exhibit on View During N. Y. Motor Show

A group of twelve paintings portraying "The Spirit of Transportation" by a number of talented artists of America will be shown to visitors to the New York automobile show, this month. These paintings depict in a dramatic manner the place of the automotive industry in transportation and its relation to the economic and industrial life of the world. They were made at the instance of the Clark Equipment company, Buchanan, Mich., which has in this fashion shown its appreciation of the accomplishments of the American automotive industry.

The artists have endeavored in these paintings to awaken a realization that the part the automobile and motor truck play from now on will vitally affect the progress and development of the world. These paintings give everyone connected with the automotive industry a broader conception of the tremendous contributions to civilization which have come through the widespread use of automotive transportation.

Visitors to the Hotel Commodore during the automobile show will see on each of the twelve columns as they enter the main lobby one of these particular paintings, appropriately framed, which tells in each artist's characteristic technique his graphic conception of "The Spirit of Transportation." The artists represent portrait, landscape, figure, marine and mural artists, etchers, and also the popular illustrato

This is ...e first time in the history of industry that a company has endeavored to dramatize the accomplishments of a great industry, and is the first time that a large company has drawn so liberally upon art in such a manner. The artists whose work is represented in this prize competition have been selected from those representing the four branches of art as follows: Portrait, marine and landscape painters, George Elmer Browne, Jonas Lie and Max Bohm; illustrators, Frank X. Leyendecker, C. Coles Phillips and James Cady Ewell; mural painters, Maxfield Parrish, Alphonse Mucha and F. Luis Mora; etchers, Frankiin Booth, R. F. Heinrich and William Mark Young.

Added interest is given to the exhibit due to the fact that in addition to the remuneration which each artist has received for his painting, a competitive interest has been awakened among them by reason of a capital prize of $1,000 which will be awarded the artist whose painting is esteemed the best. A jury of award consisting of the leaders of the automotive, marine and railway industries will view the paintings while on exhibition and will award the prizes. The second prize is a silver medal of honor and to the third goes honorable mention.

At the close of the New York show the paintings will be sent to Chicago for exhibition during the Chicago automobile show and later to Boston, where they will be on exhibit at the Copley Plaza Hotel during the Boston automobile show.

YOUNG TO SUCCEED FLETCHER?

According to a report in political circles, State Labor Commissioner R. H. Fletcher will tender his resignation about January 1 to Governor Alex. J. Groesbeck. It is said that Carl E. Young, president of the Michigan Federation of Labor, is slated for Fletcher's post. Mr. Young has served two terms in the state legislature.

SAGINAW INDUSTRY MOVES

The Allington & Curtis Company, manufacturer of dust and shavings collectors and air conveyor systems, is moving into the plant of the Wilcox Engineering Company, which it bought some time ago and enlarged to meet its requirements.

ST. LOUIS' SHOW IN TENTS

St. Louis, Mo., is going to have its annual automobile show, according to reports from that city's motor row. Officials of the dealers' association notified the members that they had been unable thus far to find a suitable building, and that while some structures were under consideration, it wns not certain that arrangements could be made to rent them when wanted. When the dealers heard all the facts they voted unanimously to hold the show under any conditions, says the St. Louis Post-Dispatch. It is more than likely, says the newspaper, that circus tents will be pressed into service. It is said that ten such tents have been purchased and that plans for heating them and otherwise making them comfortable have been made.

GMC OFFICES REMAIN IN N. Y.

In regard to the report that the General Motors Corporation intends to remove its general offices from New York to Detroit and house them in the new Durant building, President du Pont has written this paper as follows: "There is no foundation for the rumor that General Motors offices will be moved from New York to Detroit. No consideration has been given to this proposition, and it seems unlikely, in view of the many important matters to be taken up and decided, that this one of lesser importance should receive consideration. I therefore deny the report as being untrue."

STOCKHOLDERS NAME COMMITTEE

Some of the stockholders of the Bethlehem Motors Corporation, Allentown, Pa., have formed a committee for the purpose of protecting the interests of shareholders and with the hope of being able ultimately to present a plan of reorganization which will preserve stockholders' equity in the property, says the Wall Street Journal.

MOTOR ADVERTISERS' MEET JAN. 7

The Advertising Managers' Council, Motor & Accessory Manufacturers' Association, will meet in Hotel Astor, New York city, January 7, to take up the matter of future advertising policy. Among the speakers will be E. W. Clark, Clark Equipment Company, Buchanan, Mich.; Alfred Reeves, general manager, National Automobile Chamber of Commerce; C. C. Parlin, manager of the commercial research department, Curtis Publishing Company, Philadelphia, and E. C. Tibbits, advertising manager, B. F. Goodrich Rubber Company, Akron

McGRAW TIRE AND RUBBER

The McGraw Tire & Rubber Company, Akron, O., having decided to omit its quarterly preferred dividend payable January 1, President John M. Morgan has issued the following statement to the stockholders:

"The directorate wishes to call attention to the fact that affairs of the company are financially sound—the ratio of quick assets to liabilities being approximately two to one. The obligations of the company have been substantially met since July 31, 1920.

"Inventories of raw and finished material, while larger than in normal times, are well balanced and will respond to quick liquidation in sales in the early part of next year, current market prices having been used in the readjustment of inventory values.

"Attendant with the writing down of the company's inventory, the officials of the company have been meeting the abnormal situation by a policy of rigid economy in all departments, including the reduction in salaries of officers and employes.

"Directors feel that prospects for spring business are encouraging, and in support of this view can state that our sales department has received contracts from our trade, which at a conservative estimate will provide 60 per cent of the total volume of 1920 business."

FIRESTONE PROFITS LARGER

For the year ended October 31, sales of the Firestone Tire & Rubber Company amounted to $114,080,369. Those for a similar period in 1919 totaled $91,078,514. Profits amounted to $9,396,912, an increase of $89,934.

JOHNSON JOINS AUBURN

A. R. Johnson, formerly with the Cadillac Motor Car Company, and prior to that with the Hyatt Roller Bearing Company, has been made assistant sales manager of the Auburn Automobile Company, Auburn, Ind.

KING APPOINTMENTS

The King Motor Car Company, Detroit, will start the New Year with A. Weber as general manager of the plant and S. J. Feldman in charge of eastern sales and export business.

ZIMMERSCHIED MANAGES CHEVROLET

K. W. Zimmerschied, who has been with the General Motors Corporation since 1911, and who during the last two years has been assistant to the president, has been appointed general manager of the Chevrolet Motor Company, Flint, succeeding W. C. Durant, resigned. The appointment is announced by Pierre S. du Pont, president of GMC. It is understood that F. W. Hohensee will remain general manager of Chevrolet production and W. C. Sills as general manager of sales.

REPUBLIC TRUCK DIRECTORATE CUT

Republic Motor Truck Company stockholders have approved a proposal to reduce the directorate from 15 to nine members.

NEW COMPANY WANTS QUOTATIONS

The Calumet Truck Body Corporation, Calumet, has been organized with a capital stock of $200,000 to build the Calumet All-Purpose Body for motor trucks. This type of body can be used as a platform express, stake, grain, cattle or hay carrier. The company is seeking catalogues and prices from manufacturers of malleable and drop forgings and fittings for truck and cab bodies; also prices on tools and shop equipment.

PREST-O-LITE CUTS PRICES

In anticipation of lower prices of materials, the Prest-O-Lite Company has made marked reductions in prices on much of its product. Some of the prices are back at the pre-war level.

REO CAPITAL STOCK INCREASE

Stockholders of the Reo Motor Car Company, Lansing, have authorized the directors to increase the capitalization from $10,000,000 to $15,000,000 at any time they deem advisable. This action will make a special meeting of the stockholders unnecessary. General business conditions are such that an immediate increase and a declaration of a stock dividend were considered unwise. Officers were re-elected as follows: President, R. E. Olds; vice-president and general manager, R. H. Scott; vice-president, H. G. Thomas; secretary-treasurer, D. E.

Digitized by Google

Bates; assistant treasurer, D. M. Parsons. The new board of directors consists of R. E. Olds, R. H. Scott, H. T. Thomas, R. C. Rueschaw, H. C. Teel, G. E. Smith and D. E. Bates. The plant was closed December 24 to permit reorganizing departments whereby trucking in the manufacturing process may be eliminated and automobile sections handled more efficiently from machine to machine. The plant will reopen January 3.

WILLIF HEADS DUPLEX SALES

Frank B. Willif, head of the sales division of the Kelly-Springfield Truck Company, has been appointed to a similar position by the Duplex Truck Company, Lansing, according to announcement by General Manager Harry M. Lee. Mr. Willif will succeed Andrew Langenbacher, who became secretary-treasurer on the resignation of George W. Hewitt.

Goodyear Shown Sound; Refinancing Approved

Probably the most interesting fact brought out at the meeting of the stockholders of the Goodyear Tire & Rubber Company, in Akron, O., a few days ago, was the result of the audit of the company's books, which showed total assets of $155,076,840, exclusive of issued and all outstanding capital stock, and including reserves for contingencies, of $42,696,243, thus leaving net assets after payment of all liabilities to be applied to the outstanding capital stock, of $110,380,596, sufficient to pay the entire outstanding preferred capital stock in full at $100 a share and leave $44,247,973 for the common. This would mean a book value of $73.87 a share.

President F. A. Seiberling in giving these figures added that the company's good will account was not taken into consideration at all and that all raw material, including rubber and fabric, had been invoiced at its market value regardless of what it cost the company.

There were present at the meeting in person about 1,200 stockholders, says the Cleveland Plain Dealer's special correspondent, while 498,129 shares of preferred stock and 546,362 shares of common were represented by proxy. When a vote on issuing not more than $50,000,000 of first mortgage bonds, notes and such other evidences of indebtedness maturing in not to exceed 25 years and bearing 8 per cent interest, was taken, there were 499,371 preferred shares which voted in favor and only 1,120 against the proposition. Another proposal to authorize and empower the directors to issue bonds, notes or other similar evidences of indebtedness and to execute and deliver a mortgage or trust deed on the company's property securing the payment thereof, was adopted by the unanimous vote of all the common stockholders and all of the preferred shares but 987.

WILL MAKE BEET HARVESTERS

A new corporation known as the Acme Beet Harvester Company, and which will be capitalized at $25,000, has been formed at Alma. The company has just been granted permission by the Michigan Securities Commission to sell $10,500 of its common stock.

The beet harvester, which the company is organized to place on the market, is still somewhat in the experimental stage, but is said to have shown great promise in tests in beet fields around the state. Arthur Lippert, formerly a machine and tool designer of the Republic Motor Truck Company, Inc., and the Fordson Tractor Company, invented the machine.

BUSINESS CLUB ELECTS OFFICERS

At the annual meeting of the East Lansing Business Men's Club officers were elected as follows: President, O. R. Adams; vice-president, C. W. Chapman; secretary-treasurer, W. I. Gilson.

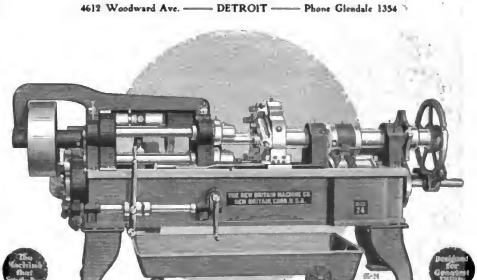
DID YOU READ

The First Article in December "Machinery"?

"MAKING BRASS FORGINGS" is the title. And it describes the new methods developed by the Mueller Metals Co., Port Huron, Mich., for the production of parts made from brass, bronze, and other non-ferrous metals. The following is a brief quotation therefrom:

"During the war, brass forgings or so-called 'die-pressed castings' were made in large quantities to be subsequently machined into various fuse parts, but otherwise the forging of brass in dies had not found wide application in the United States.

"Several noteworthy advantages are secured by forging brass, bronze, or copper parts to the required shape, instead of turning the work from bar stock on an automatic screw machine or making it by some other familiar method of manufacture. Chief among these are the facts that it is possible to effect a substantial saving of high-priced metal; that parts can often be forged in a way that enables them to be utilized with little, if any, subsequent machine work, thus saving a heavy labor cost; and that the process of forging imparts greater density, freedom from porosity, and additional strength to the metal."



The Mueller Company have installed "New Britain" Multiple-Spindle Automatics as the most efficient means of finishing many of the parts illustrated.

If this article seems to point to possible economies on your work, we shall be pleased to give you the benefit of our experience along this line.

Our new catalog illustrates several pieces of this character, the operations performed and the productions obtained being indicated. Send for a copy

Transportation

WASHINGTON—Operating statistics for large steam roads, recently prepared by the Interstate Commerce Commission, shows for the period January 1 to October 1, 1920, a general increase in operating efficiency over the same period last year. A comparison follows:

Item	January 1920	October 1919	% increase 1920 over 1919
Miles of road operated	229,429	229,314	0.5
Freight train miles*	454,337,000	394,956,000	14.3
Pass. train miles*..	409,703,000	390,857,000	4.5
Loaded freight car miles*	11,413,566,000	10,138,467,000	12.6
Empty freight car miles*	4,991,612,000	4,777,981,000	4.5
Net ton miles*	330,964,000,000	295,967,000,000	11.8
Gross ton miles*	618,744,000,000	563,350,000,000	12.7
Gross tons per train	1,462	1,562 (d)	1.3
Net tons per train	723	726	1.0
Cars per train	27.4	28.8 (d)	3.6
SERVICEABLE CARS ON LINE DAILY:			
Home	510,173	(a)	
Foreign	1,818,197	(a)	
Total	2,328,370	2,267,788	1.8
Cars stored	15,044	180,932 (d)	91.7
Car miles per car day (b)	28.1	22.2	8.1
Net ton miles per day (b)	466	429	13.3
Tons per loaded car (b)	29.0	28.3	2.5

*—Excluding mixed and special trains.
(a)—Separation not available.
(b)—Including mixed and special trains.
(d)—Decrease.

Lansing—Road commissioners last week protested to the Michigan Public Utilities Commission against the 40 per cent freight increase, declaring that the excessive cost of hauling gravel would discourage road building. It was charged that former increases by the Interstate Commerce Commission have been unfair, an that unless new rates were made road construction would become prohibitive. It was decided to held another informal hearing January 6, when representatives of the railroads will be present. If no understanding can be reached a formal hearing will be arranged.

Washington—The Interstate Commerce Commission has given the Adams, American, Wells-Fargo and Southern Express companies permission to consolidate properties and business into the American Railway Express Company. The Commission was divided on the issue, two members, McChord and Meyer, dissenting on the ground that such a consolidation would stifle competition. The majority of the commissioners thought the merger would result in equal rates and better service.

Lansing—In affirming the award of $800 given Col. Ira G. Humphrey, Monroe, by the lower court in his suit against the Detroit, Monroe & Toledo Short Line Railway to recover damages for an over-charge in fares between Monroe and Detroit, the Michigan Supreme Court ruled that the company could not increase its fares without proper authorization. Col. Humphrey was charged 65 cents on each of four trips between the two points, although the fare fixed by franchise was 50 cents. The claim made by the company was that the new fare was fixed by order of the Interstate Commerce Commission. The higher court ruled that the question of whether the company was engaged in intra-state or interstate commerce did not enter into the case.

Washington—According to statistics of the Interstate Commerce Commission, coal consumption by locomotives in road service on the principal lines increased 10,000,000 tons in the first ten months of 1920, as compared with the consumption in the same period last year, the figures being: 1920, 81,752,821 tons; 1919, 71,619,009 tons. The average cost of coal per ton in 1920 was $5.95, as compared with an average of $3.21 in 1919. The cost of coal in different sections shows great variation. Roads in the New England region are paying $7.72 a ton, while those of the Central West are paying $3.38.

INDUSTRIAL BUILDING

Progress, Projects and Contracts of the Week

Niles—The prediction is made that there will be a building boom in this city in 1921, as compared with $104,356. Losses—Detroit, $2,996,029, as compared with $7,989,502 last year in November; Bay City, $333,550, as against $546,000; Battle Creek, $18,950, as against $205,000; Grand Rapids, $444,396, as against $676,090; Saginaw, $144,743, as against $318,467.

in 1920 at least 100 houses have been erected; also a $100,000 factory for the National Standard Company, an $80,000 plant for the Standard Oil Company, a $100,000 theater, extensive additions to the Niles Lumber Company, a brick factory for the Spinks Manufacturing Company, a two-story garage for A. E. Saum, a $75,000 addition to the garage of P. H. Friday, a building for the American Cleaners' Laundry Company, and the first unit of the proposed $500,000 addition to the Fourth Ward school. These are only the more important of the many construction jobs of the year.

Detroit—The November building record in some of the largest cities of Michigan as compiled by the American Contractor is as follows: Gain—Lansing, $323,000, as compared with $210,150 in 1919; Kalamazoo, $108,554, as compared with $104,356. Losses—Detroit, $2,996,029, as compared with $7,989,502 last year in November; Bay City, $333,550, as against $546,000; Battle Creek, $18,950, as against $205,000; Grand Rapids, $444,396, as against $676,090; Saginaw, $144,743, as against $318,467.

Kalamazoo—Construction work during the week ended December 18 represented an expenditure of only $13,450, as compared with $68,675 for the corresponding week in 1919. The building permits totaled 11, the most important one being for a residence to cost $4,500.

Muskegon—The city didn't grow any too rich from the building fees it collected during November. The total was only $69. The amount involved in construction was $21,840. Of this $10,000 was for new buildings, $4,060 for repair jobs, $3,025 for 16 garages and $4,000 for a business house front.

Grand Rapids—During the week ended December 23 the total involved in building permits issued was $67,350. The week before the amount recorded was only a few thousand dollars. The largest item on the list is a school, to cost $56,500.

Lansing—Work is being rushed on the construction of the salesroom and garage of the Robson Auto Company, to be ready for occupancy by about February 1. The building is being constructed by the H. G. Christman Company at a cost of about $60,000, and is of artistic pressed brick and plate glass.

Detroit—Thomas Barlum & Sons have provided for the construction of a two-story market building at Bates street and Cadillac Square. The exterior construction will be terra cotta and the interior finish white tile and marble. Market stalls will be provided on the first floor and accommodations for mercantile establishments on the second.

Kalamazoo—Architectural plans and specifications for a warehouse building, on the city yards, have been presented to the city commission by C. Miller, of the Miller Construction Company. The commissioners reviewed the plans, but delayed action. The plans as presented call for a $21,000 building. This price would provide for the installation of plumbing and heating fixtures. The building would be large enough to provide room for all of the city's machinery, as well as supplies used in improvement work. Funds for financing construction will be provided in the 1921 budget.

Detroit—A two-story factory building, 100 by 160 feet, is to be built on a site at Martin and Southern avenues for the Federal Screw Works. The materials will be concrete and steel with texture faced brick and Bedford cut stone trimmings. Two railroad sidings will be laid.

Lansing—Oscar F. Jackson plans to erect a multiple residence building on property just purchased in a central location.

Studebaker Discontinues Horse-Drawn Vehicles

The Studebaker Corporation, of Detroit and South Bend, Ind., has decided to discontinue the manufacture of farm wagons and other horse drawn agricultural equipment and will concentrate exclusively on motor cars and trucks.

When it is remembered that Studebaker has been making the Studebaker wagons some 75 years, that these products are considered standard and have been selling the world over, it may be said that there can be no pessimistic outlook for the automotive industry, for such an old established concern would not discontinue a line for which there is still a fair demand without being sure that the product to take its place would be in as great demand. And that is just what the Studebaker officials think, according to dealers.

In making the announcement the corporation said that the decision would become effective when present materials on hand had been used. Mr. Erskine, president of the concern, is quoted as having said to one of the oldest distributors that the house had made the decision with reluctance, as the horse drawn product had been manufactured for so many years and had met with so much success, but, he added, even standard products must make way for something better.

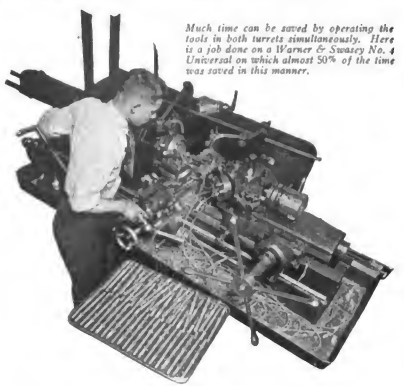
The Studebaker Corporation in 1919 discontinued the production of spring vehicles.

JACKSON LEAVES OVERLAND

Vice-President Edwin B. Jackson, of Willys-Overland, Inc., Toledo, O., has resigned and will withdraw from the concern at the end of December. He was in charge of sales. This work will be continued by the sales manager, A. C. Barber. The retirement of Mr. Jackson followed closely the resignation of Vice-President Clarence A. Earl. It is rumored that further changes in the higher personnel of the Overland organization will take place.

CALUMET & HECLA OPERATIONS

For the last three months the conglomerate department of Calumet & Hecla has produced an average of 2,750,000 pounds of refined copper a month. There will be practically no curtailment of forces in this branch of the property and it is expected production will continue on the basis established in the last several months. Although no attempt has been made to increase the output of the reclamation plant, its production, on the other hand, has not been decreased, continuing about 1,000,000 pounds a month.



Six furnaces are now closed at the Calumet & Hecla smelter. One of these is of the larger type, with a capacity of 1,000,000 pounds of refined metal monthly. Two large furnaces are still in commission. The rest of the furnaces take between 40,000 and 50,000 pounds of mineral to a charge. The furnaces are not being forced

COX FORMS PARTNERSHIP

Keith Cox, public accountant, well known in Chicago, and who recently opened a Detroit branch office at 530 Penobscot building, has taken on two new partners and the former name of Keith Cox & Company has been changed to Cox, Komarek & Redding. E. J. Komarek is the originator of automotive and manufacturing accounting systems and J. J. Redding has had considerable experience as a construction accountant. The Detroit office is in charge of J. Ross.

FOREIGN TRADE MEETING PLANNED

Western Michigan bankers and business men are to be called together by Clay H. Hollister, Grand Rapids, in the near future to discuss participation in the Foreign Trade Financing Corporation, to be capitalized at $100,000,000 to finance trade overseas.

Much time can be saved by operating the tools in both turrets simultaneously. Here is a job done on a Warner & Swasey No. 4 Universal on which almost 50% of the time was saved in this manner.

A Production Engine Lathe

This is the right term for the Warner & Swasey No. 4 Universal Turret Lathe, as it does all that an Engine Lathe can do, and a great deal more. The carriage with feeds in both directions and equipped with the standard taper turning and chasing attachments, makes it capable of doing all kinds of work accurately and quickly.

Two No. 4 Universal Turret Lathes at the Kelsey Wheel Company, Detroit, have just replaced six Engine Lathes in their tool room. Other tool rooms in great number use these machines for blanking out taps, reamers and other tools that take so much time on Engine Lathes.

Are you doing work on an Engine Lathe that should go on a Warner & Swasey No. 4 Universal Turret Lathe?

MICHIGAN MANUFACTURER AND FINANCIAL RECORD

EDITORIAL

DETROIT, SATURDAY, JANUARY 1, 1921

The New Year

THIS ISSUE of this paper bears the mark of a new year in its date line. We have turned the corner again and have a new twelve-month of activity, work and worry before us. The year 1921 is the beginning of a new era in American business. The people of the country have, by a decisive vote, determined upon a change in their national political administration. This change involves the application of the economic theories upon which the platforms of the successful party are based. The moment of change comes when the work of readjustment of governmental obligations and of the burdens upon the people to make their obligations good is just about to be entered upon. With the single exception of the formal act of terminating the war with Germany, we have put the war behind us. We have left as a heritage thereof our public debt incurred to maintain it, our obligations to the men who fought it and a sadly muddled industrial condition growing out of the conversion of our industrial facilities to the needs of war rather than those of peace.

The first two months of the year will belong to the old order, politically and otherwise. The remainder thereof, and probably the seven years to come, will belong to the new order. The primary thing to be undertaken is the reorganization of the public debt and the methods desired to support it. Luckily, our debt is largely internal. No serious amount of it is held abroad. As a matter of fact, the debts of the foreigners are held by us as an offset in the world account. So that our conversions and reconversions will have to be made in the light of the advice of our own people, rather than according to a plan which will suit foreign holders. To that extent we are in an advantageous position. But during this year we will have to settle several things regarding this debt. It was incurred and the plans to support it were made on the theory that it should be paid by the present generation. That accounts for the intolerable character of some of our present taxation plans. If we change this theory into one providing for the spreading of the debt and its payment into the long future, then we shall be able to take advantage of lower interest rates and lower annual contributions to the extinction of the debt, which will in themselves be palliatives of the present-day conditions against which our people's faces seem to be set.

Our next great obligation, which seems to be looming up rather conspicuously, is that to the men who fought the war. The taking of many hundreds of thousands of young men, the workers of this generation, from the pursuits of peace to apply their energies to the works of war entails a great public obligation to them as individuals. After the Civil War the obligation of the successful contestant of that conflict to its soldiers was composed successively into pensions for the injured and the maimed, support for the dependents of the dead soldiers, and eventually a general pension provision based practically on service. The dominant political majority during the World War was composed of the descendants of the losers in the Civil War, who had, quite naturally, no sympathy with the pension system which was elaborated for the benefit of the northern soldier participants in that war. Therefore, the entire fiscal system set up in advance to provide for the wreckage and ruin wrought to the men of the World War was based upon the theory that pensions should not exist as one of its consequences. The man whose dependents were to be made comfortable, in the event of his becoming a casualty of the war, was obliged to take out an insurance, half of the cost of which came out of his $30 monthly compensation. He had to add to the discomforts of his military condition in order to save money for his insurance. This insurance has been to some extent converted by the survivors into long-period insurance, but on the whole it is not going to take the place of pensions. At present the compensation theory, as most largely favored, takes the form of a bonus, some favoring money and some favoring land. But it is to be feared that the Government has not enough of either to go around, even if the plan were desirable. Youthful enthusiasm is always willing to discount its future into present-day capital. But even if that were done, there are bound to appear, as age supervenes, many sad physical results of participation in the World War, and the temper of the republic, always kindly to its saviors, will be in favor of alleviating that condition, regardless of earlier compensation. So that we are extremely likely to have pensions for the World War in the future. If such is to be the case, the sooner we get at the setting-up of the scheme, the better for all. The adjustment of our obligations to our soldiers is, therefore, one of the problems of the period to which this New Year is introducing us.

The readjustment of industry will bring its problems, has brought them and laid them at the feet of the New Year for solution. Our industries flattened out in the last half of 1920 by reason of the buyers' strike—not a formal strike, but a strike just the same. The reduction in the cost of living means that the items of compensation which enter into the costs of production must shrink. They are not likely to shrink to anything like the figures prevalent before the war, but the people are not drilled in the scheme of bookkeeping that compares this day's, this week's, this month's and this year's income with those of the corresponding periods one, two, three or four years ago. The public memory extends to yesterday. Yet the adjustments which have been made in wages so far do not indicate any recurrence to the pre-war scale. In the textile industry, for instance, a very general reduction of 22½ per cent is being made in wages. Even this reduction leaves the scale of industrial compensation in these lines 60 per cent higher than it was before the war. If no greater reduction in compensation has to be made than this, and if thrift is put at work, we ought, as a people, to round this corner very well.

These are the big problems of 1921. This New Year's day marks the calendar beginning of the new era. Let us hope that when the adjustments are over we may look to the initial day of the period, and recur to it as the Happy New Year's Day.

Free Trade in Motor Vehicles

NEW ECONOMIC CONDITIONS, as well as politics, make strange bed-fellows. Here we have Hiram Johnson and Josephus Daniels with their heads together; over in the corner that one-time ferocious old roaring lion, William Jennings Bryan, has lain down with the lamb, Warren Gamaliel Harding; but oddest of all is that group of men slapping each other on the back out there in the hall—the free traders and the makers of motor vehicles. If there ever was any such thing as "the old order," it is being so rapidly obliterated in these days of world business readjustment that you would hardly recognize it if you met it on the street.

If, back in 1909, when the Payne-Aldrich tariff law was being drafted, a delegation of automobile makers had descended upon Congress with a demand for absence of duties on motor products from abroad, their fellow manufacturers would have countered with a demand for a lunacy commission. The same

Digitized by Google

would have been true in hardly less degree had any such proposal been made in 1913, when the Underwood bill was under consideration. But now, we are told, the ways and means committee of the House of Representatives will receive on January 15 a group of men from the National Automobile Chamber of Commerce who will ask that in the forthcoming Fordney bill the products of European automotive factories be admitted to this country duty free. And, contradictory though it may seem, no volume of protest may be expected from the industry as a whole. Indeed the proposal appears to have the manufacturers' approval.

The industry, of course, has a reason for its change of front. That reason is that it seems to be convinced that its future success is tied up definitely with overseas trade, and it wants to be in position to take the greatest possible advantage of the opportunities offered in foreign markets. It believes that one of the prime requisites is the removal of European duties on the importation of American cars, trucks, parts and accessories, and to bring about that removal it wants the United States to take down the tariff wall erected against similar overseas products, in the hope that the European governments will reciprocate in kind. It dismisses as negligible what has always been the chief objection to free trade—inability to compete on even terms with cheap European labor. American methods of quantity production and sales will take care of that, is the answer. In other words, the industry is willing to take chances in a free-for-all, with no favors asked.

Except as a sop to European governments, it does not appear to this paper that the imposition or removal of a tariff on overseas automotive products would make much difference. Under the present tariff schedule of 45 per cent, shipments of American automotive products abroad have increased in a measure which is nothing less than phenomenal, the total, it is estimated, reaching $365,000,000 for the current year—a million dollars' worth of vehicles daily. This as against importation of European automobiles and trucks to the extent of only a few hundred thousand of dollars. We believe that during the year 1919 less than 150 overseas cars came into this country. Perhaps the removal of European tariffs would broaden the market for American cars abroad, although that is to be doubted. The removal of the American tariff against foreign machines might put the European governments in a frame of mind where they would not be so amenable to the arguments of their manufacturers to impose embargoes on American automobiles, as has been done by France and Italy. If it would, the action might be worth while. Considered solely as a tariff proposition, however, our opinion is that the American motor manufacturers can realize maximum possibilities abroad even with high duties to contend with.

It is not outside the range of possibility that the National Automobile Chamber of Commerce has reached an incorrect conclusion as regards the temporary slump in automotive sales abroad—that it has come to believe that tariff barriers, and not a scarcity of money, is responsible; and believing that, hopes to effect a resumption of sales by revising the tariff. If that is the case, it will find the remedy, if applied, ineffectual. The same conditions as obtain in the domestic automobile market—and markets of all other commodities, for that matter—are to be found overseas. Money is tight everywhere. And in addition to that, the disparity in the exchange rate militates against European purchases in this country. When money begins to flow freely once more, and the exchange approaches a balance, sales will pick up all along the line, and, unless we are mistaken, the manufacturers will be wondering why they laid so much stress on the tariff.

Unsound

THE House of Representatives probably will not concur in the passage of the Poindexter bill prohibiting strikes by railway employes, and it is to be hoped it will not. Such legislation is not only unconstitutional—involuntary servitude is no longer recognized in this country—but is in contravention of American principles, and in addition to all that it is unenforceable. Moreover, it would establish a precedent which would react upon business, in that if the courts were empowered to penalize workmen who declined to work, would there not also arise a demand backed by equal show of fairness that the courts could penalize factory executives who found it advisable to suspend operation of their plants? What is sauce for the goose is sauce for the gander.

Under its war time powers the Government undertook to prohibit strikes in the coal mining and railroad industries. We all know the result. The men went on a "vacation." If Congress made strikes illegal, workmen with grievances could take a "vacation," and surely there can be no law against vacations.

That there ought not be strikes on the railroads goes without saying. And there ought not be strikes in other industries. But workmen will continue to strike, law or no law, until they are convinced that strikes do not pay. A campaign of education, and not more legislation, is what is needed.

Short Measure Stuff

THE WAIL OF THE MANUFACTURER

In the realms of Manufacture
Things occur that sometimes pall
And good resolutions fracture;
Then we sip our cup of gall.

With that hope which seems immortal,
Eagerly we paw the mail;
'Ere the postman's left our portal
Hopes are dashed—and we turn pale!

"Please accept this cancellation;
Business here is slow just now."
That's the proffered explanation
Which we read with furrowed brow.

Now they're off—a stampede started;
Cancellations right and left;
Leaves us in a sea uncharted,
And of sanity bereft.

Here, we've planned, and worked, and worried,
Worn out Bradstreet's, also Dun's;
Bought machines and had them hurried,
Written letters by the tons.

"Kindly cancel all our orders."
Oh, ye Gods! What faithless men!
Now our thought on murder borders,
And we cuss and cuss again.

Is it any wonder, Brother,
Manufacturers go wild?
It's enough to make a Mother
Turn against her only child!

Well, boys, we must grin and bear it,
How much longer, none can tell,
It's our party; yes, we swear it,
Manufacturing is—Hell!!

FINANCIAL

THE BUSINESS OUTLOOK

By PHIL S. HANNA

WE of the United States of America are a strange lot. Things are either awfully good or awfully bad—no in-between conditions are ever permitted to exist in our consciousness, except in banks and other conservative institutions which have their profit margins set by law, and which, as an avocation, no longer appeal to so-called live wires. Business is either superlatively good or superlatively poor in our minds. Time is broken up into as small units as possible, and in each little unit most of us expect to find an increase of profit and an increase of volume over the previous unit; but history will not have it this way. What we need for 1921 is a broadening of these units of time and a relaxation from the high pressure expectation of larger volume and higher profits with each report from the book-keeper. We have spent a fortune preaching thrift, but always to the other fellow; and usually while business has been exhorting the individual to be thrifty and store up to meet personal losses and pitfalls, the same preacher has been putting profits into brick and mortar and steel in order to make the next unit of time show larger sums. And now that in 1921 an application of the thrift principle to business so that the next depression or readjustment, or whatever pet name you choose to describe the process of taking the stretch out of business, will not find the U. S. A. rushing to an extreme of retrenchment in a feverish hope of quickly curing an extreme of inflation.

The swing to the other extreme will be in vain, for such a concerted action necessarily will destroy the life blood of business—profits; and overhead has a ravenous appetite. If I have been doing business with you and suddenly cut you off entirely, your profits on my business cease and you in turn try to offset the loss by cutting off someone else; and so on down the line until before I know it a like amount of my profits have been eliminated. But if I merely curtail my business with you, there is still something for you to go ahead on and when the boomsrang gets back to me it does not wipe me out. If the country were visited with a pestilence, or a crop failure, or were not fundamentally sound, the mad scramble to get under cover might be justified on selfish grounds, but with so much of promise before the country it is difficult to explain the retrenchment fever, except insofar as the the American love of extremes sheds light on the situation.

We may expect a fair sized business revival before long, not only because the average consumer is nearly out of clothes and other necessaries, but, I believe, more for the reason that thinking men are beginning to realize the presence of a common enemy in the form of too much retrenchment. Bankruptcy is a fatality which is contagious. One concern saved may mean the saving of many others, and it was a sign of much encouragement this week to notice three deadly competitors in a certain industrial line joining hands to save a fourth from a receivership. If the common enemy in this case had not been apprehended, perhaps all four might have suffered eventually. Before the days of the Federal Reserve System it was common to find competing banks joining hands to bolster up a threatened member of the banking community for the common good of all and to the benefit to each.

Another hopeful sign for 1921 is the fact that more thought and study is being given to the business future. The preachments of business observers have regained a willing ear and the professional Moses can get an audience at any hour of day or night.

The condition of business as reflected by the mnemotional figures given out by Dun's and Bradstreet's, the Government and the Reserve Banks reaffirms what we are well and uniformly convinced of—that liquidation is pursuing its course. But the observation from the figures is the surprising evenness of it all. Failures as reported by Dun's are not more in numbers or volume than should be expected; bank clearings and total bank debits to commercial accounts exhibit a reduction in commercial transactions which is natural, and the federal banks' figures show decreasing deposits and increasing loans and circulation, which are also the logical accompaniment of business depressions. It is unfortunate that the Government has absorbed about $3,000,000,000 of credit which might have been used by business, but this is just one of the inconveniences which we are suffering because of the war, and we should not complain. The Annalist index number is down to 204, which may be compared with the high figure of 330 last June, and means that the wholesale price of 25 food products to the jobber or dealer is just about half way back to the pre-war level. Criticisms continue to pour in locally that the corner grocer does not seem to be aware of the existence of index numbers, but gradually we find an item now and then that he will take less for. Not so with the butcher, who seems to be making a regular Custer's last stand of it.

Our representatives at Washington—that is, part of them, and of a political faith not generally espoused in these parts—have gone on record disfavoring the artificial method of making business good for part of the people. And right here is a thought for 1921. How is the rest of the world going to pay us back the seven billion of loans and four billions of open accounts if we shut out imports? Read this from Buenos Aires. La Razon says: "There is no good in protesting against what the Americans are doing. We must imitate them. In playing the same game we will come out ahead." The paper then goes on to suggest increased tariff on American imports. From Toronto comes a similar complaint. Germany would buy our surplus if we were disposed to lend it the money, but France and England and the rest of Europe will buy in the cheapest market, which, as to wheat, is even now in Argentina. British wheat buyers, who are said to have been the chief purchasers of American wheat this fall, are right now being offered Argentinian wheat at 7 cents below our price, and there is lots of wheat down there, too. Shall we make it less profitable for our best customers to sell goods to us and thus turn them to other markets for their purchases, and more than likely in the bargain reinflate our currency and our cost of living? I think any experiments in this direction will soon tell us plainly No. A creditor nation which already has one-third of the world's gold and which has fifteen billion dollars coming to it must take goods and lots of them or the debts can never be paid. And the basis of taking the goods must allow of profit to the debtor. We are bound up now in the business of the world in such a way that we must consider the foreign proposition whenever we make a move at home.

The securities market has staged a partial comeback, but as this is being written the bears are still busy. American Light & Traction common stock got down to 57 during trading Tuesday and the sugar stocks are still sinking gradually to lower levels, but the amount of transfers at the low figures is small compared with the sales at higher figures. Individuals who own large blocks of corporation stocks which have been hammered down are complacent and have not lost confidence by these demonstrations, for the opinion is almost general that many of the low prices are purely a result of sales made for income tax purposes. If we witness a general rise early in January this theory will be substantiated.

The banks have not at this writing been called on for statements of condition, but the call for some years past has been made December 31 and is therefore expected at that date. A falling-off in deposits of the savings banks would be a natural consequence of business conditions and should not be viewed with particular concern, for the people must necessarily live on their reserves when employment is waning. Banks are reservoirs of surplus wealth and they are merely providing the natural, fundamental service to their depositors in releasing to them in these times part of the stored-up accumulations.

Fluctuations in the commercial banks vary widely from day to day, so that a statement on one day may vary substantially from that of the following or preceding day, and one bank may thus show a greater percentage of change than another. But a general downward level of commercial deposits would be a natural outcome. Bank profits are apt to be large for 1920, due to high money rates; but taking one year with another, the average profits are only commensurate with the hazards of the business, and these hazards are confined to the minimum by skilful management. It is fortunate in that the banks in the aggregate have not been obliged to overwork their credit with the Federal Reserve Bank. Those who have borrowed heavily have done so without profit to themselves and to the everlasting benefit of their customers. Detroit and Michigan banks will go into the new year with a large surplus of unused credit at the reserve institution, and there is in this alone much to give us confidence in the future.

Send In Your Bank Statement

THE financial editor of this publication will appreciate your sending in statements of condition following the December 31 bank call, and also subsequent calls. Lists of directors and officers for the new year, following the annual meetings of stockholders on January 11, are likewise desired.

SECURITIES BOARD ENJOINED

The Michigan Securities Commission, which recently assumed supervision of the various discount and finance corporations now operating in the state, has for the time being at least been restrained from carrying out its regulation program. The federal district court of eastern Michigan has granted an intervening restraining order which affects 13 finance corporations in the state association, and which prevents the securities commission from carrying out its October order. This order would prevent finance corporations from distributing dividends without the sanction of the Commission, and which also affects the corporation stock, completely tying the hands of the directors. An injunction in the case of the Security Mortgage Corporation et al versus Frank W. Merrick et al, had already been issued, and the intervening order is the outcome of the court's action in this petition.

Reference to the original action taken by the Commission was made in the issue of November 27, Page 33.

AMERICAN SHIPS TIED UP

The back-wash of the receding tide of foreign trade is being expressed in New York by the tying up of many American freight steamers and several passenger boats. International Mercantile Marine has tied up the St. Paul, New York and Philadelphia passenger liners, and the cargo carrier Minnesota. Three of the 18 Luchenbach freighters, which have been carrying coal to Rotterdam, have been tied up, owing, it is claimed, to rate slashes which foreign boats here awaiting cargoes have made. The Munson Line has tied up four boats taken from Cuban trade. The Southern Pacific-New Orleans line is doing a good business and the Clyde-Mallory line to Jacksonville is doing well. Many foreign ships are bidding for coal cargoes at any price in order to make the homeward trip show some return, but the rate war is on with a vengeance because of the sudden falling-off in tonnage offered.

Net earnings of the Columbia Gas & Electric Company for the year ended November 30 were $9,916,869, an increase of 29.49 per cent over the total for 1919.

In any Export Emergency

Whether the grounds for refusal are justified or not, your export shipment needs special safeguards when your documentary draft on a foreign buyer is dishonored. It is in just such emergencies that the service departments of the Irving's Foreign Division demonstrate their capacity and initiative.

Not only is the refusal reported to you at once, but immediate provision for clearing, warehousing and insuring the merchandise is made through the Irving's local correspondent. Then the Foreign Division, consulting with you and acting under instructions, arranges for sale of the goods or for their disposal in some other approved way.

A collection anywhere over-seas is expedited by direct transmission of the draft and its accompanying documents to a carefully selected correspondent bank on the spot, familiar with local conditions and able to protect your interests at every stage of the transaction.

His Valuable Time---
Is what the Busy Man begrudges, when acting as your Agent or Trustee. He does not mind the work; he is used to that. But there are not hours enough in the day for both his own business and yours.

Why ask it of him? Here is a well-established Trust Company, the oldest in Michigan. Its Departments render you a specialized service. Its large force of men and women is devoted to this business.

Our "Living Trusts" afford complete relief to property owners.

Weekly Federal Reserve Statement

OWING to short week, which included Christmas, the Federal Reserve Banks rendered statements of condition as of Thursday instead of Friday, as heretofore. We give below a condensed statement of all the Federal Reserve Banks and for comparison show figures for last week and the nearest date a year ago.

The reserve ratio of 45.1 per cent. while more than the figure for a year ago, 44.8 per cent. is 0.4 per cent less than the figure for December 17—45.5 per cent. Deposits of member banks, including deferred credits and uncollected items, fell off $234,000,000 during the six days from December 17 to December 23, and note circulation increased $60,699,000. A year ago deposits of member banks, including all items, were $3,684,654,000, about $663,000,000 more than December 23, and circulation was $747,409,000 less.

For the first time in several weeks holdings of member bank paper secured by war obligations showed an increase, reflecting the drawing by the Government of some of its deposits. The increase in note circulation is the reverse of a healthy tendency in view of the downward trend of deposits, but this is supposed to be largely due to needs of the holiday season.

Resources and Liabilities of the Twelve Federal Reserve Banks Combined

	Dec. 23, 1920	Dec. 17, 1920	Dec. 26, 1919
RESOURCES			
Total gold reserves	$2,655,502,000	$2,042,368,000	$2,078,422,000

Aggregate debits to individual account as reported by 146 of the country's leading clearing house associations for the week ended December 22 were 9,696 millions, or 460 millions more than for the immediately preceding week. This increase in bank debits, in which all the larger centers, except Minneapolis, participate, reflects mainly the larger volume of holiday trade.

As compared with the corresponding week in 1919, debits for the week under review are 441 millions smaller, the total for New York city alone showing a reduction of 364 millions, while many of the larger centers, including Philadelphia, Cleveland, Pittsburgh, Baltimore, San Francisco and Los Angeles, report larger figures than the year before.

DEBITS TO INDIVIDUAL ACCOUNT AT CLEARING HOUSE BANKS SUMMARY BY FEDERAL RESERVE DISTRICTS

	Federal Reserve District	Number of centers included	Week ending Dec. 22, 1920	Week ending Dec. 15, 1920	Dec. 24, 1919
			(In thousands of dollars)		
No. 1	Boston	12	$ 484,421	$ 448,392	$ 526,042

General Financial News

BANK OPENING DELAYED

The new Continental Bank, Detroit, has postponed its opening date to January 15 on account of delay in finishing the improvements of the building at Broadway and Gratiot avenue. Election of officers probably will be held January 11.

NEW SAVINGS SCHEME

The American Loan & Trust Company, Detroit, is out with a new plan for combining life insurance with savings accounts for a term of years, at the end of which the depositor receives first mortgage bonds in settlement of the principal. The scheme is ingenious and sound and should appeal to the thrifty.

SUPREME COURT USURY RULING

The supreme court of Michigan ruled last week that where a bank or other money lender charges a usurious rate of interest on a continuous string of note renewals the full amount of all such interest charged or collected may be offset against the face of the note in final settlement. Case references will be furnished on application.

FIRST DIVIDENDS ON NEW STOCK

The E. W. Bliss Company, Brooklyn, N. Y., has declared its initial dividends on stock under the new capitalization plans whereby common stockholders received 10 shares of new stock for one of the old issue and one additional share of second preferred B stock for each common stock share held. The dividends just declared are of 55 cents on the new no-par common stock and of 15 cents on the new second preferred B stock. The regular quarterly dividend of $1 a share on the preferred stock also was declared, all dividends being payable January 3.

LANSING BANK PAYS BONUSES

Directors of the American Savings Bank, Lansing, have authorized the usual semi-annual dividend of 4 per cent, and in addition appropriated $3,300 in bonus money to be distributed among the salaried members of the staff as a Christmas gift. This bank, organized a decade ago, will close the year with one of the best records in its history.

1920 A GOOD YEAR

The Lansing State Savings Bank has distributed a bonus of $4,268.65 to 31 officers and employes, and a 10 per cent semi-annual cash dividend to the stockholders. President J. Edward Roe, reports that the bank closes one of its most successful years. The annual meeting of stockholders will be held January 11.

MACLAR RECEIVER NAMED

The Detroit Trust Company has been appointed receiver for the MacLar Battery Company, Detroit, which has been making the "Master" storage batteries. It is stated that the trust company will make application to the courts for permission to sell the assets.

MISCELLANEOUS FINANCIAL

The Continental Motors Corporation will hold its annual meeting January 19 and the stock transfer books will be closed from January 4 to January 19.

The forty-seventh annual convention of the American Bankers' Association will be held the week beginning October 2 in Los Angeles according to announcement of the executive committee Wednesday.

It was reported Wednesday that the Ford Motor Company has deferred reopening of its Highland Park plant until February 1st.

Strategy in Investing

Putting a thousand dollars to work for a long term of years to earn 7% to 8% means, not merely that the income will purchase $70 to $80 worth of goods each year for the life of the investment, but $70 to $125 worth, as commodity prices get back to normal.

There is perhaps no stronger argument for investing in long term bonds now. Especially strategic, therefore, is the action of exchanging shortly maturing bonds for sound, long-term issues.

Our pamphlet, "Prices and Values," analyzes the strategy of bond exchanges from the standpoint of intrinsic values and the effects of conditions on prices. It points out many specific issues still low in price and gives comparisons helpful in passing judgment.

A copy will be sent free on request and without obligation. A representative will call to discuss the general market conditions with you, if you desire it, or you may accomplish satisfactory results by calling at our office.

HOPKINS GOES TO FLINT

E. P. Hopkins, better known as Ned Hopkins, as Charlotte, Michigan, many who has been manager of the Woodward avenue branch of the Bank of Detroit for the past two years, leaves January 15 to become auditor of the Genesee County Savings Bank of Flint. Hopkins was a state bank examiner under Commissioner Doyle and also under Commissioner Merrick and is particularly well fitted for the new work. We join with his many friends in wishing him well in the new undertaking.

NEW DIRECTORS AT ALMA

At a meeting of the directors of the First State Bank, Alma, a few days ago, E. C. Crandell was elected to succeed the late Henry H. Soule, and J. M. Montigel was elected to succeed P. M. Smith, who recently moved to California. These men will serve until the annual meeting of the stockholders in January.

Your Will

You like to have it in life.

You cannot hope to have it in death, even in the disposition of your property, unless you have made your Last Will and Testament.

For if you die leaving no Will the law will determine the distribution of your property, and degrees of blood relationship, rather than your desires, will then control.

If you would make altogether sure that your wishes will be respected, you should have your Attorney draw your Will, NOW, and designate this strong, experienced Company as your Executor or Trustee.

SECURITY TRUST COMPANY
FORT AND GRISWOLD STS. CAPITAL AND SURPLUS $1,000,000.00 DETROIT

A Happy New Year—

is best assured by careful planning of your financial affairs.

These are days when every dollar must be made to do its duty. Idle money recklessly "plunged" in unproved investments are not doing their share to restore normal conditions. An investment in Detroit Mortgage Corporation First Mortgage Bonds will work for you and the betterment of Detroit.

Banks and Bankers

MUSKEGON TRUST ELECTION

The Muskegon Trust Company, Muskegon, held its annual meeting December 11 and re-elected its present officers for another year. The officers are: Fred W. Riblet, president; J. Arthur Dratz and Fred M. Breuninger, vice-presidents; Harold M. Thruston, vice-president and secretary; Robert D. Harvey, assistant secretary; Henry E. Langeland, treasurer; board of directors, W. A. Angell, J. A. Hilling-hurst, Fred M. Breuninger, J. Arthur Dratz, John S. Emerson, Frank W. Garber, Rev. A. Hadden, Henry E. Langeland, Frank C. Morse, Fred W. Riblet, Frank Hubbard Smith, E. H. Sheldon, Harold M. Thruston, John Vander-werp, Frank C. Whitney and Ira A. Wyant, and Otto L. Goffrey, title department manager.

The company announces that its new building will be ready by February 1. Work on this structure is proceeding rapidly and the first story has already been completed.

BRANCH FOR HIGH SCHOOL STUDENTS

The Dimondale State Bank, Dimondale, will open a branch at the Dimondale high school next week, the service to be for the student body. An official of the bank said: "To establish and encourage thrift is the duty of every bank, whether it brings an immediate return or not. The Dimondale State Bank takes up this school service work, partly as a matter of business and partly as a matter of obligation to the community in which it lives and in which it hopes to prosper."

STATE FUND INTEREST INCREASED

An increase of ½ of 1 per cent interest on all state funds deposited in banks will be demanded by the State of Michigan after January 1. This increase will add about $40,000 to the commonwealth's revenue. The new rate will be 2¾ per cent, to which is added ½ of 1 per cent for insurance, making a total of 3¼ per cent. The same increase affects checking accounts.

BANKS DISTRIBUTE GIFTS

Detroit banks and trust companies have distributed to employes cash Christmas gifts this year amounting to more than $300,000. The Wayne County & Home Savings Bank gave employes 10 per cent of their salaries, the total amounting to $60,000. The cash gifts of the First & Old Detroit National and the Peoples State banks to employes amounted to $50,000 for each bank. The Dime Savings Bank paid the fourth quarterly installment of 24 per cent of salaries to employes. The First State Bank distributed $15,000 in gifts, and other banks gave from $5,000 to $20,000 in cash.

A SUGGESTION FOR BANKS

The boarder apparently is adding to his ranks not a few new recruits. From information furnished by the American Bankers Association there is a tendency toward increased hoarding on the part of many people who are afraid of banks. Why not bring the object lesson home to possible depositors in your city by using in your local advertising examples like the one given below?

WANTED TO BE HIS OWN BANK; BANDITS GET $600

Battle Creek, Mich., Dec. 20.—James Callahan, Grand Trunk employe had a hobby for keeping his money in $20 bills. Nor did he make any secret of the fact, or that he carried his roll with him, sometimes as much as $1,500. He didn't believe in banks. Last night two strangers met him, almost in front of his home. They relieved him of the roll, amounting this time to $600. Today, Mr. Callahan stated he had started a bank account.

Other examples will be given as they come to our notice.

The Romance of Michigan Industry

THIS series of articles, the first the recital a stirring romance.
of which, "How Michigan Is Supplied With Power," appears as the leading article of this issue, will run throughout this year. The purpose of the series is to present in panorama the operations and output of the 27 or more basic industries of this fifth industrial state in the Union, drawing to the reader's attention the unique and the spectacular in the processes by which are turned out annually more than $15,000,000 of products which play such a vital part in the industrial life of the nation. The series marks the first attempt so far made to present graphically the scope of the accomplishments of Michigan industry as a whole—accomplishments which make of

The author of the series, Mr. Howard Campbell, technical editor of the Michigan Manufacturer and Financial Record, has spent more than 15 years first as a workman and later as an efficiency engineer and executive in various Michigan manufacturing plants, and therefore knows whereof he writes. His style is entertaining, his presentation clear and understandable. He has written the articles so that they will be of equal appeal to the executives in the factories and the men in the shops, who specify and use equipment and materials described.

The following subjects will be taken up in the order and on the dates specified:

Jan. 1—Power
Jan. 8—Power Transmission
Jan. 15—Sugar Industry
Jan. 22—Foundry Work
Jan. 29—Paper Industry
Feb. 5—Metal Forging
Feb. 12—Rubber Industry
Feb. 19—Lathe Operation
Feb. 26—Leather and Belting Manufacture
Mar. 5—Screw Machine Operation
Mar. 12—Auto Body Building
Mar. 19—Milling Machine Operation
Mar. 26—Copper and Brass Milling
Apr. 2—Planing and Shaping
Apr. 9—Agricultural Implement Manufacture
Apr. 16—Boring Mill Operation
Apr. 23—Electrical Equipment Industry
Apr. 30—Drilling
May 7—Steel Ball Manufacture
May 14—Grinder Operation
May 21—Salt Industry
May 28—Punch and Power Press Operation
June 4—Saw and Lumber Mills
June 11—Gear Cutting
June 18—Lumber Finishing Mills
June 25—Heat Treatment of Metals
July 2—Woodenware Manufacture
July 9—Welding
July 16—Marine Engine and Boat Building
July 23—Polishing and Plating
July 30—Shipbuilding Industry
Aug. 6—Inspection
Aug. 13—Chemical Industry
Aug. 20—Conveying Systems
Aug. 27—Tobacco Manufacture
Sept. 3—Small Tool and Air-Tool Manufacture
Sept. 10—Pottery Manufacture
Sept. 17—Office Equipment Manufacture
Sept. 24—Abrasive Industry
Oct. 1—Auto Wheel Manufacture
Oct. 8—Cement Manufacture
Oct. 15—Mining Industries
Oct. 22—Motor Axle Manufacture
Oct. 29—Paint and Varnish Manufacture
Nov. 5—Auto Spring Manufacture
Nov. 12—Stove Manufacture
Nov. 19—Auto Steering Gear Building
Nov. 26—Flour Milling, Food and Canning Industries
Dec. 3—Furniture Manufacture
Dec. 10—Silk and Knit Goods Manufacture
Dec. 17—R. R. Car Building
Dec. 24—Pharmaceutical Industry
Dec. 31—Shoe Industry

How Michigan Is Supplied With Power

(*Continued from Page 9*)

voltage to a point where it can be used with safety. From the substations to the customers' meters, the method of distribution is varied to suit the conditions. The street and interurban railway companies take their supplies at the substation switchboards. In the central area of Detroit the general service distribution is direct current by underground "feeders," mains and service cables. In the remainder of Detroit and in the other cities and villages and throughout the rural districts, distribution is by overhead wires, the current being carried to transformers on or near the premises of customers, where the voltage is stepped down to suitable pressure for lights and motors.

An interesting and important feature in the operation of such an extensive power system is the office of the "load dispatcher," from which all orders for the addition or curtailment of power are issued. The "load" varies greatly throughout the day as the business of the day progresses, and every variation in the amount of current used registers immediately on the indicator on the load dispatcher's desk. In the morning as the first lights are turned on in the homes and the early cars begin running, the hand on the indicator drops back a point. The dispatcher immediately calls (by direct connection) a waterpower plant operator away up on the Au Sable river, and directs him to put one of his generators on the line. This machine, although so many miles away, takes care of the extra load and the hand on the dial creeps back to normal. Then as the day advances, the load dispatcher anticipates the coming heavy load and orders other plants to come in on the line, so that the current will be sufficient to take care of all requirements. As lights are turned off or as the factories close for noon or night, the dispatcher orders equipment or stations off the line, so that the power is properly conserved. He also orders out the "trouble-shooters" wherever there is trouble on the line, and gives the necessary instructions for the opening and closing of switches on the trunk lines. The dispatcher has before him a map of the system, equipped with miniature switches which are opened or closed as the real switches are opened or closed, so that he can tell at a glance just what plants are operating.

Thus these two companies, by means of the co-ordinated effort which is possible only by highly perfected organization, are able to supply 344,000 homes and 9,400 industries throughout the state with the necessary light and power for carrying on the daily tasks.

METRIC SYSTEM BILL DRAFTED

Senator Frelinghuysen, New Jersey, is the author of a bill in Congress making the metric system the standard for measurements in the United States. The bill does not make it compulsory for manufacturers to adopt the system, but provides that industry may use the English system in manufacturing, but may use the metric system in commerce. A period of 10 years is allowed in which to accomplish the transition from the English to the metric system. The bill is supported by petitions containing 100,000 names of persons favoring the metric system.

WOULD ORGANIZE CONTRACTORS

Building contractors of Grand Rapids have instructed Secretary Harry J. Hoskins to visit towns in Western Michigan and feel out sentiment concerning a contractors' association covering that part of the state. The contractors at one time had a very successful state association, but it was allowed to lapse during the war.

HARDENING

We are equipped to take care of the treating of steel and make a specialty of automotive parts. We also can carbonize or temper tool, jig and fixture parts. Our truck enables us to give you 24-hour service.

GRINDING

Special screw machine equipment enables us to specialize in the manufacture of the following parts, all of which can be ground by the centerless method. We can grind to any accuracy required.

Piston Pins
Valve Roller Pins
Roller Clutch Pins

Dowell Pins (Hardened Straight)
Oil Pump Plungers
Rollers (Grinding Rolls Straight)

State Obtains Injunction To Prevent Rate Increase

An injunction was issued December 24 by Judge Charles H. Collingwood, Ingham circuit court, restraining the steam railroads in Michigan from increasing their passenger rates. An order to show cause was issued returnable January 11, 1921.

The injunction was asked by Attorney General Groesbeck and is the result of the recent conference between the Interstate Commerce Commission and the representatives of several states, including Michigan, when it was virtually decided that a rate of 3.6 cents a mile would be necessary to maintain satisfactory service. Officials of the 18 railroads affected have been served with the injunction notice by the state police.

During the Washington conference an effort was made to restrain the Commission from issuing arbitrarily a series of rate increases, declaring the jurisdiction over intra-state rates was held by the state legislatures. It is held that damage to people in Michigan would result if the rates were increased, while the state would also lose because of the traveling costs of its officials and employes.

An effort will be made to have the injunction made permanent. It is possible that the Interstate Commerce Commission may ask a federal court order restraining Michigan from interfering with the establishment of the new rates.

BRIDGE CHARTER ASKED

The Canadian Transit Company, the corporation which will operate the proposed suspension bridge across the Detroit river from Detroit to Windsor, has made application to the Canadian government for permission to build the span. A. F. Healy, Windsor, one of the provisional directors of the company, says that if the charter is granted, work will start within a year. The cost will be in the neighborhood of $30,000,000. The provisional directors include E. B. Winter, Windsor; W. J. Pulling, C. E. Fowler, engineer; W. R. Campbell, C. S. King, mayor of Walkerville; G. M. McGregor, W. L. McGregor, F. Joyce and A. F. Healy.

CHICAGO PNEUMATIC TOOL CHANGES

H. L. Dean, manager of the compressor and engine sales division of the Chicago Pneumatic Tool Company, Chicago, New York and Detroit, has resigned. The company has appointed J. F. Huvane eastern manager of compressor and engine sales, with headquarters at No. 6 East 44th street, New York City, and G. C. Vander Boom, western manager of compressor and engine sales, with headquarters at No. 300 North Michigan Boulevard, Chicago.

BUZZELL OPENS AD AGENCY

J. J. Buzzell, formerly a member of the advertising staff of the General Motors Corporation, author of two books on sales letter writing, and an advertising man of considerable note, has resigned from the GMC to open an advertising service office in the Henry building, Woodward avenue and Grand Boulevard, Detroit.

DETROITERS ON A. B. A. BOARD

John S. Drum, president of the American Bankers Association, has announced appointments of the various committees and commissions for 1921. Three Detroit bankers are to serve. John W. Staley, president of the Peoples State Bank, is on the Economic Policy Commission and the Public Relations Commission. Frank W. Blair, president of the Union Trust Company, is on the Finance Committee, and Robert B. Locke, manager of the Federal Reserve Bank, Detroit Branch, is on the Committee on Public Education.

Production Managers—

Quantity Production of Shafts in Continuous Heat Treatment Furnace.

Write nearest branch for Bulletin 217 B and learn whether this method is adaptable to your product and manufacturing conditions.

The following advantages are secured by the Continuous Method of Heat-Treatment:

Increased production per unit of floor space.
Reduction in manual labor per unit of production.
Uniformity of product, resulting in decreased scrap, following less dependence upon the human element.
The fuel economy that naturally follows the direct transfer of heat in spent gases to incoming material.
Improvement in working conditions by cooler shop.

In short, the saving in cost of the finished product due to economy in labor, time, fuel, floor space, decreased rejections, etc.

Do these advantages appeal to you?

The Double Cross In Seattle

(*Continued from Page 10*)

been rescued from a condition of demoralization and uncertainty as to the future to one of buoyant confidence and steadily growing success under the rule of law, fair dealing and justice.

"The Seattle Chamber of Commerce and Commercial Club, in common with the rest of our citizens recognizing the inestimable service rendered by the Associated Industries not only to this community but to the whole state, called upon one of its committees to prepare a report along the line of the great work of the Associated Industries. That committee, composed of energetic and public-spirited men, after months of careful study and consideration submitted a report to the Chamber September 20. It was not intended to enter the field now so successfully occupied by the Associated Industries. But approaching the subject not exclusively from the standpoint of the employer or the employes but from that of the public at large, its aim was and is: To familiarize that public with the essential principles of law and order and fair dealing that must be upheld if the city is to grow and prosper and be a fit place for men, women and children to live in.

"The trustees have compared the plan of the Associated Industries' committee on industrial relations, introduced in many Seattle institutions in 1920, with that of the plan of the Chamber's committee on labor relations recently submitted, and find them similar in all their essential intents and purposes.

"This report was unanimously adopted by the board of trustees.

"It is not too much to say that the committee's report is remarkable for the conscientious care and industry with which it was prepared, for its breadth of view and for its persuasive appeal to all our people to unite in building up this city on a basis of law and order and even-handed justice.

"It is not to be wondered at that the few individuals in this city who find their personal advantage in agitation, threats and turbulence have sought to misinterpret and pervert this report from its true and obvious aim."

American Campaign Reopened

As a result of this coup, Seattle Industrial and business leaders were obliged to reopen the American Plan campaign on a more intensive basis and augment it with a strenuous fight against the Farmer-Labor party. The fate of the Farmer-Labor party is well known, but Seattle is still fighting for the American Plan, although the situation is less desperate than it appeared prior to the election.

In calling upon the property owners, business and professional men and organized and unorganized workers opposed to radical leadership to stand together in an effort to break the grip of radicalism on the city, Edwin Selvin, editor of the Business Chronicle of the Pacific Northwest, closed his article with this statement:

"Let the labor movement come clean and it will have the sympathetic co-operation of the business interests. Workingmen have the right to organize. They have the right to collective bargaining. But with collective bargaining there should go collective responsibility. There should be laws compelling labor unions to incorporate so that they can be held responsible legally and financially for their acts. The honest American worker is a fine type of citizen; the present type of labor leader is not always a good citizen or an honest man. It is high time for an awakened and enlightened public sentiment definitely and decisively to drive the dishonest labor leader into the wilderness."

CANADIAN CAR & FOUNDRY

The Canadian Car & Foundry Company and its associated companies report assets of $43,828,951 on September 30, 1920, as compared with $35,017,435 a year ago. Surplus is now $7,061,556 as compared with $6,243,603 in 1919. The directors have decided to distribute 6 per cent negotiable script in payment of dividends in arrears on the cumulative preferred stock, amounting to 22½ per cent.

WORLD'S STAR CO. ELECTION

On account of the recent death of President Henry B. Smith, the stockholders of the World's Star Knitting Company, Bay City, met last week and elected the following officers: President, D. L. Galbraith; vice-president, M. H. Smith; secretary and treasurer, Howard F. Smith. The above officers, together with C. A. Galbraith and A. Galbraith, were elected as the board of directors. Louis M. Nims was re-elected general manager.

GRAND RAPIDS OFFICE OPENED

A. W. Ehrman & Company, Detroit advisory accountants, have opened a branch office in Grand Rapids, in the Fourth National Bank building. Martin Dowd, for several years in the income tax department of the United States government, at Washington and Grand Rapids, will be in charge. The company will specialize in audits, income tax reports and tax systems. Detroit offices are located at 1314 Ford building.

ATLAS IRON REORGANIZED

John W. Bass is president of the Atlas Iron & Steel Company, Detroit, recently organized to take over the business of the Atlas Iron Works. The capital stock is $200,000.

Aladdin

Most Modern Housing Project in the South

The Delgado Mills, Wilmington, North Carolina, erected fifty Aladdin houses for their employees. These fine, comfortable homes are provided with toilet facilities, electric lights and running water.

The Delgado Mills experience has been complete satisfaction. The management of the biggest and most progressive corporations in the country are providing improved housing facilities for their employees. Big firms all over the country are placing orders for Aladdin-made industrial houses. This is not a philanthropic movement, nor is it welfare work; it is a sound, sane business proposition.

The workman who has a comfortable home to go to is a satisfied workman. The housewife and the children in such a home are happy and contented to stay in it.

In addition to making many types of industrial homes, we also manufacture hotels, stores and churches.

When you are ready to consider your housing problem bear these facts in mind:

Aladdin—

—expedites your building project—
—houses your men well and quickly—
—saves 18% of the cost of lumber—
—save 30% of the labor cost—
—reduces the skilled labor required—
—guarantees complete shipment of material—
—guarantees the quality—
—carries material for 1,000 houses in stock—
—ships from the nearest timber region—

—quotes definite prices on any order from one house up to a city of 3,000, including churches, schools, offices, water and sewage systems, electric plants, street and house lights, heating plants, street parks, trees, lawns, etc., complete.

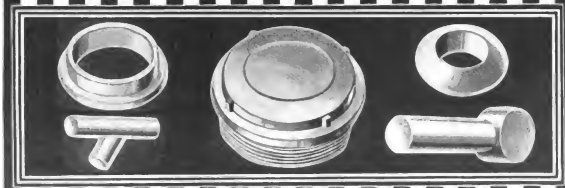
MUELLER Forgings in Brass and Bronze



For all parts where density, yield, elongation and tensile strength are factors, *MUELLER* Forgings are more economical and efficient than sand castings, because the brass is first heated to cherry red and then subjected to pressure of 200 tons per square inch.

MUELLER Forgings are non-porous—are free from flaws and sandholes—are held to close dimensions, thus saving metal, labor and machining. Mixtures can be varied to secure special working conditions. Submit samples, state quantities desired, and we will quote interesting prices.

MUELLER METALS CO., PORT HURON, MICH.

Makers of "Red-Tip" Brass Rod; Brass and Copper Tubing; Forgings and Castings in Brass, Bronze and Aluminum; Die Castings in White Metal and Aluminum; also Screw Machined Products.

How the Banks Stood By Business in 1920

Examination of Character of Credits Extended Answers Question, "When Will They Loosen Up?

By PHIL S. HANNA

WE HEAR quite often these days in business circles the familiar remark, "When are the banks going to loosen up?" and other similar cracks to the effect that it is the banks which have caused all this depression. Those who haven't taken a fling at the commercial banks have given the Federal Reserve System a round chastisement, alleging that these have purposely raised the discount rates, to the detriment of business, and that credits in general have been unduly restricted. I have never yet had the slightest suspicion of ulterior motives on the part of the Reserve Banks, and after going back for a year to study the figures of loans by them to member banks and by the member banks to their customers I am more convinced than ever that a study of the figures will go a long way to set this matter right in the minds of any doubters. The better to illustrate the extent to which the banks and the Federal Reserve System expanded themselves to care for business during 1920 I have drawn up a set of graphs which are shown herewith.

I take it that our readers are generally aware of the general plan of operation between the banks of the country and the Federal Reserve System, but for the benefit of those who are not familiar with this system I shall deviate long enough to describe the situation briefly.

In ordinary times, when the demands of business for credit are normal, the commercial banks generally find that the deposits of their customers are sufficient to allow them to loan out all the funds required by any given community and thus the function of the Federal Reserve System is mainly that of holding the reserves of its member banks. If the amount of gold on hand happens to be unduly or unnecessarily large in proportion to the reserves of members, the federal banks may employ their surplus funds by purchasing bills in the open market in order to make earnings enough to cover expenses, but until the members begin to call on the central system for currency or for credit, the Federal Reserve Banks function mainly as their name would imply—as reserve banks. They have, however, another function which plays an important part, and that is the power of issue. At present the currency in use is made up of about $700,000,000 national bank notes and about $3,600,000,000 Federal Reserve notes of both kinds, and, as may be noted from the graphs, the amount of Federal Reserve Bank notes in circulation follows quite closely the increase or decrease in loans by the Reserve Banks to the member banks.

Let us look first at graph No. 1. How have the banks taken care of their customers in the matter of increasing loans? The first curve, showing a steady downward trend, shows how the loans made on Liberty bands and all other classes of war issues have decreased from $1,320,000,000 in January, 1920, to $900,000,000 at the end of December. While the small owner of Liberty bonds has no doubt made up part of this total as a borrower, it takes a great many small borrowers to make up in the aggregate as much of a loan as one large borrower will obtain, and the deduction therefore is that the major portion of loans on war paper have been to the wealthy, and of course to corporations which have reduced their obligations of this nature during the year more than $400,000,000, as the graph shows.

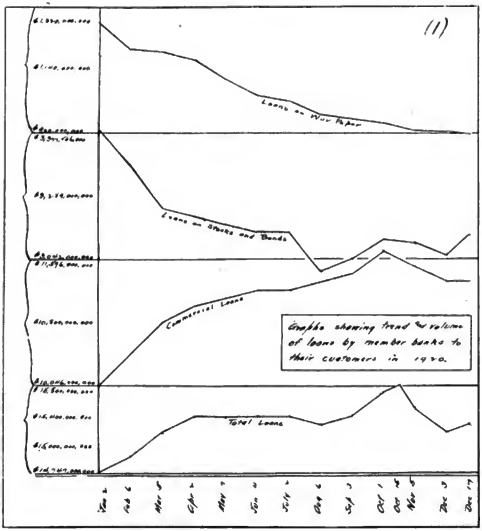
The second curve on graph No. 1 represents the trend of loans on stocks and bonds. It shows a steady reduction until August 6, when there was an increase, followed by a decrease

Warns Against Cutting Advertising

S. E. CUNNISON writing in the Bulletin of the Brooklyn Chamber of Commeree, of which he is a director, warns industry and business against eliminating or reducing advertising space at this time. He says:

"Advertising should be maintained and not cut at this time when manufacturers are so seriously overstocked with goods. We have come to a period critical in the growth and even existence of many business houses. Decisions made today will be determining factors in the success or failure of the years to come.

"The greatest and most successful concerns have always been the most consistent advertisers. Mindful of lessons of the past, they safeguard the present and anticipate the future."



Next Week:

Beet Sugar Manufacture in Michigan

In this article, the third series of 52 constituting "The Romance of Michigan Industry," Howard Campbell, technical editor of the paper, discusses one of the state's basic enterprises, taking up plant facilities and processes, personnel, value and distribution of the product, and the various other phases of the subject, the whole being a graphic picture of the industry in the state.

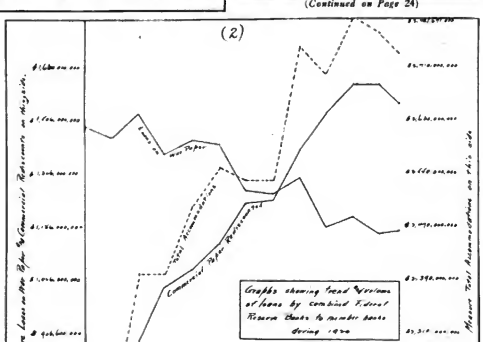
Other Timely Features

Digitized by Google

December 3, but the year closed with a net reduction in these items of about $159,000,000.

The third curve shows the trend of commercial loans and discounts and brings out the real story of how the banks have taken care of their customers. Starting with a total of $10,046,000,000 in January, these loans increased to a high figure of $11,774,000,000 on October 8, or a net increase in accommodations to business houses, contractors, farmers, retailers, manufacturing corporations and the like, of more than $1,728,000,000 for the first eight months and eight days of 1920. From October 8 until the close of the year these loans decreased gradually, due to the liquidation which set in with full force about October 1, until on December 17 the total had dropped to $11,535,000,000, a reduction of $439,000,000. The net result is that the year 1920 closed with the business concerns of the country owing the banks $1,289,000,000 more than they owed the banks January 1, 1920. And still many will ask, "when are the banks going to loosen up?"

On comparing the three curves, it is plain that the credit accommodations of the banks during 1920 have been taken away largely from the borrower on stocks and bonds and Liberty bonds and turned over to the commercial interests of the nation.



The last curve on sheet No. 1 shows the trend of total bank loans during 1920. Except for a slight downward movement in August, the trend was upward from January 2 to October 15. For the year the net increase in all kinds of loans by the banks was $593,314,000, but on October 15 the increase stood at $1,107,000,000.

As stated in the beginning of this article, when a commercial bank finds that its reserve is running low, it may increase it by rediscounting its short term notes given by customers and by borrowing in its own name upon United States collateral. Theoretically, when a bank's reserve runs low, it is supposed to discontinue making new loans and to call in enough of its outstanding loans to replenish its reserve, but history has taught us that the condition of all business may prevent the application of this theory, and thus the Federal Reserve Banks were organized to step into the breaches of this kind and furnish currency or credit to banks needing either until such time as the condition of business might permit of a liquidation of outstanding loans. The facts have been, however, during the early part of 1920, that reserves dropped down and a still further demand of new loans had to be taken care of; so the commercial banks went further and not only called on the Reserve Banks to replenish reserves, but were obliged to borrow for the purpose of rediscounting, and it is just here that the average man has failed again to appreciate the efforts of the banks to keep the business wheels turning with some similarity of normalcy.

Now let us turn to graph No. 2, which shows the extent to which the Reserve Banks have taken care of the commercial banks. Take the dotted line curve which on January 3 showed total loans to member banks of $2,231,187,000 (right hand margin) and follow this across the chart. After June 4 there was a slight falling back, but between January 3 and November 5 the Reserve Banks increased their loans to member banks $623,000,000 (see dotted line, graph No. 2). The other curves on this graph follow in the main the tendencies shown by the curves on graph 1, namely that loans on war paper decreased throughout the year while rediscounts of commercial paper increased. In other words, the business of the nation was given a right-of way by the banks over speculators and all other classes of borrowers.

The third graph shows the increase during 1920 of Federal Reserve notes in circulation and is ascending every period except for the

Getting the Power to the Machine

Transmission Methods Used in Michigan Plants; An Examination of Their Respective Advantages

BELT AND INDIVIDUAL MOTOR DRIVES AS USED IN TWO DETROIT PLANTS

At the left is shown a typical department of belt-driven machinery—the grinder department of the factory of the Packard Motor Car Company, Detroit. At the right is a section of the turret lathe department of the Central Gear Company plant, showing machines driven by individual motors.

By HOWARD CAMPBELL

IN CONSIDERING the question of power and its application to the machinery which it is to drive, we are confronted with a rather complex subject. Undoubtedly the first method of transmitting power ever used was that of coiling a rope about the cylinder or wheel to be turned, and to this day there are a great many places where the rope as a means of power transmission is holding its own.

The last few decades, however, have seen the development of the belt drive, and by far the greater amount of machinery, especially that used in the production of small metal parts, is belt-driven. The use of chain is coming more into favor, also, as a result of recent developments in chain-belt engineering. It is often exceedingly useful for the transmission of power within the limits of a single machine, and beyond a doubt will be applied to many new uses in the future.

There are three phases of power transmission to be taken into consideration, viz.: the transfer of power direct from the engine to the machines, as is done in small shops having their own power plants; using the engine to drive dynamos from which the current is transmitted to motors for the purpose of driving lineshafts, which, in turn, drive the machinery; or driving each machine with an individual motor of the capacity required to drive the one machine.

Merits of Each Method

The respective advantages and disadvantages of these various methods are in direct ratio to the conditions, size of the machines to be operated, and the duty that is to be performed. Where the amount of equipment to be driven is not too great, the economy of driving direct from the lineshaft is apparent. But where the volume of equipment is so great as to necessitate the division of the plant into several departments, the problem is solved by the use of electricity. In this case, all the machines which would be most likely to be in operation at one time are grouped together and a motor supplied for the group. And very recently a number of plants have been built in which the individual motor-drive system was adopted, thus eliminating the problem of belts, shafts and countershafts, with all the attendent accessories.

Among the latter the plant of the Central Gear Company, Detroit, a division of the General Motors Corporation, is an excellent example. This factory is quite new and has never produced to the limit of its capacity, but it is estimated that 1,450 complete differentials can be produced daily when production is normal.

THIS is the second of Mr. Campbell's series of 52 articles comprising "The Romance of Michigan Industry." The third, to be published next week, will discuss beet sugar manufacture in the state.

Equipment includes nearly 900 machines, such as lathes, screw machines, grinders and such other metal-working machines as are necessary in the production of gears, with floor space for 500 additional machines. Each machine in the shop is driven from its own individual motor, the motor being attached to the top, rear or other place where it will not interfere with the operation of the machine. Power is supplied by the Detroit Edison Company, in the shape of a 4,600-volt current. At the plant it is transformed down to 440 volts, alternating current, for power purposes, and 220 volts for lighting. Inside the shop the wires carrying the current are encased in tubing, a line of which crosses the shop above each line of machines. From these main lines tubes branch down, one to each machine, carrying the wires which are attached to the motor. The ceiling of the shop and all the tubing is painted white, as are all posts and walls, and the result is astonishing to those who have been accustomed to the more common variety of shop with its various kinds and sizes of belts, shafts, hangers, shifters, pulleys and other paraphernalia.

Taking Care of the Wires

There are no wires in sight excepting at the junction of the tube with the machine motor. Such machines as require five horsepower or more to operate are equipped with rheostats, but the lighter machines are equipped with automatic starting devices. To start one of these the operator has only to push a button and "the machine does the rest." The gear-cutting machines are equipped with automatic switches or "cut-outs" which shut off the power when the operation of cutting all the teeth in a gear is completed, thus saving the gear from being spoiled. Gear-cutters are automatic, one operator taking care of several machines. Obviously, the operator could not shut off each machine at the critical moment.

Thus a length of small white stationary tubing takes the place of shafting, countershafts, pulleys, hangers and belts, with all the attendant dirt and danger. If it becomes necessary to take the machine apart for repairs, or if the machine is needed in another part of the factory, it can be easily disconnected, mounted on casters and wheeled away to its destination, where it is quickly connected again and is ready for production. There are no countershafts to take down and put up again and no belts to cut and lace. While the machine is running it is using power; when it stops, the power consumption stops also. And many machines are not actually running more than 50 per cent of the time.

Digitized by Google

However, nothing is perfect, and occasionally a motor burns out or gives trouble. At the end of each row of machines is an emergency push button, connected to a bell and a number on a register in the repair shop. An electric shop truck, loaded with the necessary tools and apparatus, with an electrician, is always on duty. If a machine motor gives trouble it is only a matter of seconds until the repair man has located the machine and is making the necessary changes. If a motor should burn out it is quickly and easily replaced.

However, such power transmission equipment as that described above is very much the exception. There is no doubt that the first cost is an important factor, and the case of cost of motor equipment versus the more usual kind has never been settled as yet.

Obviously, the factories which have been using belts and pulleys for years are not likely to discard their present equipment and install a new system. The larger and heavier machines in practically all modern shops are motor-driven, however, due to the great amount of power required.

Belting in the Majority

A recent survey of the methods of power transmission employed by American manufacturers has disclosed the fact that 78 per cent use belting (or rope) in their plants. Of this number 48 per cent use leather belting, 21 per cent rubber belting, 16 per cent fabric or balata, 9 per cent chain drive, 2 per cent Manila rope drive, and 1 per cent wire drive.

Practically all machine shops and factories engaged in the production of small articles or parts use leather belting. Rope drives are used largely in paper mills, mines and for the purpose of driving rock crushers, textile mills, rolling mills and similar machinery. This is due largely to the fact that the heavier machinery, once started, runs continuously throughout the working period at a given speed, while the smaller machines not only are started and stopped frequently, but the belts are shifted from one pulley to another to vary the speed of the machines according to the operations being performed. In a shop operating under normal conditions, the leather belt unquestionably is the best, although fabric or rubber are sometimes used. Leather being pliable, though strong, was early used for the transmission of power. The treadmill, which operated with a form of belt transmission, dates back to antiquity. And the same qualities which make leather preferable to woven fabrics for transmission purposes today, probably made it preferable then. A leather belt, properly taken care of, will last practically a lifetime. There are numerous records of leather belts running 25 and 30 years. The famous "Centennial Belt," made by the Edw. H. Ladew Company, Philadelphia, has been running continuously 24 hours a day, 300 days a year since 1877—43 years, and is still doing strong.

However leather belting is expensive and there are some places where fabric can be used with good results. Among the substitutes for leather is Burmaline, which is canvas impregnated with a composition intended to impart wearing qualities. It is not waterproof. Canvas-stitched belts are used in many places where the duty is light. Balata belting is made of canvas, thoroughly impregnated with a gum solution resembling rubber, which makes it especially adapted for use in places where it may have to run through steam or water. Balata is not affected by steam, water, animal oils, grit, alkalis or exposure. However, it will not stand heat.

For a great many years the cable and grooved pulley, or "rope drive," was the favorite method of transmitting power. This has very largely been supplanted by the belt in this country, although in England the rope transmission is still used largely. The English use cotton rope, while in America hemp is most often employed, as it is claimed that the hemp is stronger, cheaper and will last nearly as long as cotton. Cotton rope, being softer and more pliable than Manila rope, can be used with smaller pulleys without undue injury to the fibres. This condition is aided by the natural wax in the long fibre.

There are a number of places in this country where the rope drive is still in use. It is most frequently used for driving from the engine to the line shaft, and sometimes for driving around corners where the problem of transmission is a particularly difficult one. Because of the fact that rope will not slip when wound several times about the pulley, it is very efficient where a heavy pull is required at close range. The claim is also made that the rope drive will stand much more punishment than the belt.

The first use of rope for the purpose of driving machinery was as a single endless loop, working over sheaves having single grooves with inclined sides. Double power was obtained by running two such single loops on sheaves having two grooves each. By amplification of this plan the multiple or English system of driving was developed, using several independent ropes, each running in its own pair of grooves in the two sheaves. In 1883 Wallace H. Dodge, founder of the Dodge Manufacturing Company, devised and patented the continuous or "American" system of rope driving, in which one continuous endless rope is used, winding around the sheaves successively in the several grooves, making as many wraps as may be required by the power to be transmitted.

The Monroe Installation

Practically all paper mills use the rope drive for driving from the engine to the main lineshaft, the system in use at the Monroe plant of the Monroe Binder Board Company, Monroe, Mich., being a fair sample. in this case a hemp rope is used, the diameter of which is 1¼ inches and the length a little more than 2,300 feet. The driving sheave is 16 feet in diameter, while the driven or lineshaft sheave is 8 feet. The distance between the shafts is about 50 feet. There are 20 grooves in the sheave and the width of the face is about 52 inches. The load varies from 600 to 1,000 horsepower, although it is usually between 800 and 900. The grooves in the small sheave are V-shaped, so that as the rope passes on to the sheave it is wedged into the groove and the resistance to slipping is thereby greatly increased. This wedge action also acts in opposition to centrifugal force, which latter is so potent a factor in belt driving.

The grooves in the large sheave are U-shaped, the friction obtained from a sheave of this size being great enough to pull the load without slippage. A single-groove "tightener" pulley is suspended between the upper and lower strata of rope as they engage and leave the smaller sheave. As the rope engages the sheave it passes once around, then around the single groove pulley and on to the sheave

(*Continued on Page* 34)

ILLUSTRATING THE CHAIN AND ROPE METHODS OF POWER TRANSMISSION

At the left a Link-Belt Silent Chain is shown driving a lineshaft in the plant of the Reo Motor Car Company, Lansing, and at the extreme right a Morse Silent Chain driving a running-in stand in a motor manufacturing plant. In the center is shown a quarter turn in rope drive—transmitting power around a corner.

Full Crew Bill Again Before State Legislature

According to legislative records, as regularly as the Michigan legislature convenes, just as regularly there is introduced the well-known and justly famous "Full Crew Bill," which has no connection whatever with the use and employment of intoxicating liquors, but is concerned with the number of men the railroads of Michigan shall assign to work on all passenger and freight trains.

This year, it is understood, Samuel H. Rhoades, formerly city attorney of Lansing, will introduce the full crew bill, and R. M. Branton, chairman of the Michigan state legislative board of the Brotherhood of Railroad Trainmen, will lead the campaign in favor of the passage of the measure.

The bill stipulates that a freight train crew shall consist of not less than six men, to-wit, one conductor, one engineer, one fireman, two brakemen and a flagman; that a passenger train crew shall consist of not less than five men, to-wit, conductor, engineer, fireman, brakeman and flagman, the latter to have at least one year's experience as a trainman.

The measure prohibits the employment of brakemen or flagmen in the service of baggageman, porter or express messenger in addition to his own duties. It also prohibits the operation of more than four freight trains in every 24 hours by any one railroad. The penalty for violation of the provisions of the statute would be fines of not less than $100 or more than $500, or imprisonment of not more than 90 or less than 30 days in jail.

A bill of similar character died in committee at the last session of the legislature.

ROME WIRE BRANCH OPENED

H. C. Joos, district manager for Detroit of the Rome Wire Company, Rome and Buffalo, N. Y., has opened a branch office of the company at 25 parsons street. The company operates two plants, one known as the Diamond branch, Buffalo, at which is manufactured primary, secondary, lighting, starting and high tension automotive cables, cable assemblies, harnesses, horn cables, flexible R. C. wires, heater cords, mining machine cables, special wires and cables for all electrical requirements. The Rome plant produces bare and tinned copper wires, full seale of rubber-covered wires and cables, lead-covered cables, W. P. wires, magnet wires including cotton, silk and enamel insulations. The company is incorporated under the laws of New York state at $10,000,000.

PIERCE-ARROW

Due to the lack of a quorum, the meeting of the directors of the Pierce-Arrow Motor Car Company, Buffalo, was postponed to January 11, at which time, it is reported, there is good reason to believe that the regular quarterly dividend due April 1, will be voted. The business of the company is said to be picking up, especially since the bringing out of the new series of passenger cars, for which there are about 700 orders on the books, says the Wall Street Journal, which orders are consumers' orders and not dealers' display or show cars

CLEVELAND TRACTOR INCREASES RATE

The Cleveland Tractor Company, Cleveland, in declaring a quarterly dividend at the rate of 7 per cent per year, has increased the rate 1 per cent. President Rollin H. White stated that the plant was being operated at normal capacity and probably would be indefinitely.

MACHINE COMPANY CHANGES NAME

The West Michigan Tool Company, Ltd., Grand Rapids, has changed its name to the Pulte-Korreck Machine Company. F. E. Pulte is president.

When The Ad Appears In The Magazine—

How frequently is the advertiser disappointed.

The art work graphically reproduced the product.

Highways—Where and How

What New Federal Committee Hopes to Accomplish; Conference Looking to U. of M. Meeting Held in Detroit

By F. W. HERSEY

ONE of the contributing causes of the present curtailment of Industrial operations and the attendant economic depression is limited distribution. The present business situation may be likened to a log jam, one of the key logs of which is inadequate transportation facilities. To continue the simile, the products from mill, factory, field and forest have floated freely through the existing channels of distribution to a point where the narrows have forbidden further progress. The narrows are the undeveloped inland waterways and the unimproved highways.

In normal times the ceaseless flow of commodities is absorbed along the way, so that the volume never becomes great enough at the narrows to create a jam. That great territory beyond what we are calling the narrows never sees the mass of flowing commodities. Seldom, if ever, does it reach as far as the narrows. That territory in which waterways, railroads and good highways simplify and accelerate distribution naturally becomes the center of intensive salesmanship. The railroads have opened up this territory, but in laying out these lines railroad builders had always in mind economy in construction and reasonable guarantees of future income. The inland waterways of the country have been developed more with an eye to sectional advantage than commercial value.

Existing railroads and waterways, as great as they are, fall short of serving a fair percentage of this great continent. Consequently there remain vast fields for commercial enterprise yet to be developed. Some of these territories are awaiting future railroad development, some are trusting to waterway improvement, but others hope for nothing, and even glory in their isolation.

Babson's Idea of It

Recently Roger Babson, statistical expert having under his control a large organization for investigation of Industrial and commercial problems, told me that 90 per cent of the salesmanship effort was being directed at 10 per cent of the people. He said:

"The waste in production is even exceeded by the waste in distribution. Salesmen go, not where the goods are needed, but where the railway and hotel accommodations are the best. Sales campaigns are often based upon custom rather than upon facts.

"Salesmen are sent, not where they are needed, but rather to communities where they have a surplus of goods. We should develop new fields instead of constantly striving to capture trade in fields already well developed. Let us stop struggling over the division of what is already produced. Let us stop fighting for trade which already exists. Ten per cent of the public is oversold, while 90 per cent is neglected. Three essentials are needed for continuous prosperity—intelligence, labor and capital."

To these three things I want to add a fourth —highways. Perhaps the item of intelligence mentioned by Mr. Babson includes highways as an essential evidence of intelligence. But rather than leave the fourth element to conjecture, I shall add it and repeat it—highways. All the efforts of capital, labor and intelligence will be of small avail if the broadening of production and distribution is hampered by neglect of the rail-less arteries of trade—the highways.

Some years ago, before prohibition, the usual collection of knights of the grip were swapping yarns and plying their vitals with red liquor at the bar of the old Piedmont Hotel in Atlanta, Ga. I say "old" Piedmont because while it still exists, it neither looks nor acts the same.

The Piedmont was famous as a clearing house for commercial traveling men, and the custom was to congregate there, and through the good offices of the telephone, corral such orders as were easily available. In the course of this particular evening a young salesman arrived. He was a foreigner considerably involved in the mysteries of the English language, but eager for advice and fellowship. Having offered to treat and thereby gathered to himself a host of counsellors, he sought help in selecting a territory.

Alive to his youth, both in years and experience, the counsellors mapped out a pretty route for him through unsurveyed, railroadless and almost roadless regions in the "cracker" country. The young knight expressed proper appreciation, and while the gang was hawhawing in mutual glee over the joke, he called for a horse and buggy and began his journey. For several months he drove about, sometimes behind the dignified trot a good horse, but more often in the wake of the ambulings of various species of the Georgia mule.

For months he never saw a railroad. He met persons who never had seen one. He met hundreds to whom an automobile would have been the first wonder of the universe. He took orders everywhere. He frescoed the country with cigars, samples and stories.

One of his lines was a cheap hat which sold to the trade at $12 a dozen, to be retailed at $2 each. He sold the entire output of the house he represented, and he returned to "civilization" a happy man. The roads he traveled, the people he met and the sales he made supplied the Piedmont Hotel with materials for har-fly debate for weeks thereafter. But the lesson taught by that drummer's experience, and probably little appreciated by the average traveling man in that territory, was this:

Where the railroad does not serve and only the adventurous will venture with horse or mule, there lies the future commercial field. There will be found much relief from the evils of over-production and the clogging of well developed markets. But not until such regions are linked with the sources of supply by the modern highways over which roll the motor truck and the passenger vehicle, will that relief come.

In a recent address Robert C. Hargreaves, district manager of the B. F. Goodrich Rubber Company in Detroit, said:

"Trade centers depend upon trade lines; trade lines depends upon transportation; transportation depends upon discovery, and discovery depends upon invention. These facts and forces act and react upon each other in the play of history. The most powerful factor of all is commerce, which lends men into new lands, new knowledge and new life. Commerce is the motive force back of all human progress."

Another Hargreaves utterance was this: "I like to think of highway transportation as a logical development of our great national transportation system—a system that, when finished, provides for the free and complete circulation of commerce. Arteries of commerce in the form of economical highway transport for people and commodities compel our attention."

The attention of the thinking people and the Government is now directed toward highway transport. The recent railroad experience, the emphasis on the strategetic importance of roads in military operations resulting from the war, and the realization of commerce that it has grown-up from a buyers' into a sellers' market where future prosperity will depend upon research and initiative, all compel attention to highways and highway transport.

After we had had the fiend-like, motor-propelled vehicle rushing legions of armed men to the rescue of the beleaguered city, moving foods to strike-embargoed cities and transporting coal to and commodities from factories where strike-besieged railroads have failed, are we going to hesitate longer over the problem of national highway construction?

National Road System Needed

It has been apparent to engineers, manufacturers and automotive men that the vital need of the nation is a complete system of national trunk highways so laid out as to afford easy access through county and state links, and built to withstand the wear and tear of heavy duty vehicles as well as all types of passenger cars. Aside from these physical needs there is also the need for a definite national highway administration policy that will eliminate as far as possible the vote-swapping method of establishing improved highways without regard to their actual need and value in commerce.

This much, and more, was achieved from a talk with Prof. Charles J. Tilden, professor of engineering mechanics at Yale University, New Haven, Conn., and who recently has been

(*Continued on Page* 32)

Oakland Makes War On Overloaded Trucks

OAKLAND county's campaign against the destruction of its highways by overloaded motor trucks has been started in earnest and will be conducted all winter. County officials have enlisted the co-operation of the sheriff's office, the prosecutor and the justices of the peace.

A limitation of the tonnage has been set by law and weighing jacks have been provided so that trucks can be stopped on the road and weighed. If the load exceeds the allowance based on tire measurements drivers will be cited to appear before the nearest justice of the peace. The penalty is fines of from $5 to $50, with or without jail terms up to 30 days, but the officials threaten to impose the maximum penalty for violations.

Farmers, industrial plants and business houses operating trucks, as well as trucking companies, are subject to the law.

What the S. A. E. Will Discuss in N. Y. Next Week

THE PROGRAM for the Sixteenth Annual Meeting of the Society of Automotive Engineers, in New York city, January 11 to 13, has been announced. The program for the technical features has been arranged to cover those subjects of greatest interest at this time, and sessions will be run simultaneously to enable a member to select the meeting relating to the subject nearest to his work, this innovation allowing more time for discussion of each particular subject and enabling a more comprehensive presentation of the problem under consideration. All of the technical meetings will be held in the Engineering Societies building, 29 West Thirty-ninth street, where the general offices of the Society are located.

The semi-annual meeting of the S. A. E. standards committee will take place Tuesday morning and afternoon, January 11. Several proposals for new standards and recommended practices will be discussed and voted on.

The first technical session is scheduled for Tuesday evening, January 11, and will be devoted to aeronautic engineering. C. D. Hanscom will outline the development of wing sections during the last year and Grover C. Loening will present a paper on structural design trend. Maj. Thurman H. Bane will tell of the recent work of the air service at McCook Field, illustrating his talk with motion pictures.

The annual business meeting of the Society will be held Wednesday morning, January 12. A feature of the post-business session will be the presentation, by three members, of the topic, "The Engineer's Place in Industry."

There will be three simultaneous technical sessions Wednesday afternoon, January 12, covering chassis design for fuel economy, body engineering and commercial aviation. In the chassis session A. L. Putnam will outline the many power losses, fudependent of the engine, which reduce fuel efficiency and deserve closer study. J. G. Vincent will also discuss this subject and D. McCall White will present his impression of modern chassis construction. A. L. Nelson has prepared a paper on the fuel problem in relation to the engineering viewpoint. C. W. Spicer has a short revelation to make regarding the torsional strength of splined shafts and a new principle of engine suspension will be submitted by S. E. Slocum. H. M. Crane, who will preside at the chassis session, will propose a method of rating racing cars that will encourage passenger car development.

In the body engineering session Charles A. Heergeist, venerable carriage and body engineer, will present a statement on the reduction of body weight, and Andrew F. Johnson, educator of many of our foremost body engineers, has tendered some general remarks. George J. Mercer will handle the subject of body lines and predict the styles for 1921. George E. Goddard is planning to illustrate the steps in quantity production of all-metal bodies with some very interesting motion pictures, and Kingston Forbes will discuss the relation of the body engineer to the industry.

The aeronautic session of Wednesday afternoon will be devoted to commercial aviation. Glenn L. Martin will address the members on this subject and Ralph H. Upson has prepared a comprehensive paper on the application of aircraft to the transportation of the immediate future. The development of commercial air transport lines in Europe since the war will be described by Prof. Edward P. Warner, of the National Advisory Committee for Aeronautics, who has recently returned from abroad.

Thursday morning, January 13, C. F. Kettering will disclose the results of extensive fuel research work carried on under his direction. The fuel session will be continued in the afternoon simultaneously with the highway session. Dr. H. C. Dickinson has some Bureau of Standards experimental study to present and R. E. Fielder will describe a system of thermostatic inlet temperature control as installed on the Fifth Avenue 'buses in New York city. F. A. Howard, of the technical staff of the Standard Oil Company, will discuss the volatility of motor gasoline. P. S. Tice will present briefly some conclusions reached as a result of inlet manifold flow study, and A. W. Scarratt will describe recent tests on alcohol as an engine fuel.

H. W. Alden, in opening the highway session Thursday afternoon, will emphasize the responsibility of the automotive engineer in the making and maintaining of good roads. The Bureau of Public Roads has conducted an extensive practical study of highway design during the last year, and A. T. Goldbeck will present the data and conclusions. H. E. Breed, formerly deputy state highway commissioner of New York, will present a paper entitled "Variable Factors that Influence Highway Design," and W. E. Williams will give some suggestions on unconventional highway construction.

More Ford Changes Forecast

Brownell and Klingensmith Out, Others to Follow; Some Reasons Back of the Present Disagreement

By MARC BRAUN

ANNOUNCEMENT of the resignation of Charles A. Brownell as advertising manager of the Ford Company, last Friday, and the statement made on Monday by Frank L. Klingensmith that he had relinquished his post as vice-president and treasurer, are said to be only the beginning of a series of changes among the higher officials of the Ford company. As a matter of fact, it was reported on good authority Tuesday that L. H. Turrell, chief auditor, had also retired and that Chief Engineer W. B. Mayo and Production Manager William E. Knudsen were expected to leave the company.

As is usually the case, Ford executives either were absent or uncommunicative. From someone close to some of the Ford officials, however, it has been learned that serious differences of opinion as to the conduct of the business have existed for some time. This seems to be borne out by the statement made by Mr. Klingensmith, who said:

"I have resigned from the Ford Motor Company because I am not in full accord with some of the business policies contemplated by the company in the future.

"This disagreement has been present for the past year and has finally culminated in the present severing of my relations.

"Undoubtedly the many rumors afloat during the past few days have arisen from this condition and were the inevitable result of that situation."

While Mr. Klingensmith does not say so, it has been learned that the train of events leading to the crisis started last September when Ford prices were reduced to the pre-war level, to which action the vice-president of the company and others were strongly opposed, because they did not believe that such action would lead to the increase in sales which the Fords themselves saw. Furthermore, the dissenting officials were of the opinion that not every manufacturing concern was in the same position as the Ford company and could not be expected to do things which Ford might do with the desired results. Then again, were those concerns supplying materials to Ford who absolutely refused to make any price concessions, as Mr. Ford thought they would.

Reasons for the Shut-Down

Three products are especially mentioned in this connection—steel, maple wood and corduroy. The Ford company had contracted for steel, among others, from the Cambria Steel Company and Jones & Laughlin, and when these firms declined to cut prices the Ford company, so it is said, cancelled its contracts, there issuing a suspension of steel supplies, as this material was not obtainable by Ford from other sources. On maple wood and corduroy the Ford company wanted a 20 per cent reduction in the then existing prices, but this concession was turned down. The result was the closing of the Highland Park factory. The assembly plants remained operations January 3, using parts on hand, of which there is an ample supply.

In addition to these unpleasant events, it is said that sales of Ford cars, which had picked up rapidly for about three weeks after prices had been reduced last September, suddenly started to fall off. This, it is said, was due to a variety of causes. In the first place a rumor gained headway throughout the country that Ford intended to make a further price reduction. Then came the report that a new model was soon to be marketed. Notwithstanding denials by Ford officials, the reports were taken and still are taken by many to be the truth.

On top of this were reports that Ford needed money—many millions—and that the banks were reluctant to grant him loans beyond a comparatively small sum. In this connection it is said that when some months ago the company offered the New York banks, to which it still owed $25,000,000 or $35,000,000 on the $60,000,000 loan of two years ago, one-third and asked to be allowed another time extension on the balance, the eastern financiers promptly demanded payment in full. The money was obtained, not without much difficulty, so the report goes, and it required the good will and efforts of about a score of Michigan banks to furnish Ford with the money to discharge the eastern obligation. And today, so it is said, Henry Ford is in need of more millions and is not finding a willing hand among the bankers to assist him. Incidentally, it may be added that the bankers' attitude is by no means directed against Ford's enterprises alone. Several other of the largest automobile manufacturers are said to have been refused several million dollars of loans asked.

Anti-Semitic Campaign Enters

Another cause of the present troubles in the Ford organization is said to be the attitude of Henry Ford against the Jews, or rather the anti-Jewish campaign conducted by the Dearborn Independent, which is owned and published by Henry Ford. This campaign is said to have resulted in the loss of much business to the company.

Frank L. Klingensmith had been with the Ford company some 15 years, starting in as an office assistant and working up to various higher positions, to that of vice-president and treasurer to which he assumed five years ago upon the retirement from the company of James Couzens, who, it was said, also had differences of opinion with Henry Ford as to business policy.

In speaking about his resignation from the company with which he had been associated since 1914, Mr. Brownell said that it is due especially to the ill health of Mrs. Brownell, necessitating her removal to California. Just how long Mr. Brownell will be absent from Detroit is a matter he does not know, but it will probably be for some months, during which he will decide about his future activities. He has had several propositions in mind for some time and it is quite likely that he will start in business for himself in the advertising and merchandising field in Detroit.

Mr. Brownell, who has been in the advertising business for more than 30 years, told the writer that one of his ambitions in life had been achieved, namely, to be with the concern which would be the first to make 1,000,000 cars in a year. Although he joined the Ford company only in 1914, Mr. Brownell, who had been a member of the J. Walter Thompson Advertising Agency, had handled the account of the Ford Motor Company with this agency since 1911, during which year 34,528 Fords were made and sold. That was a sensational record at the time, but Mr. Brownell predicted that the time would come when ten times that many cars would be made by the company in one year. And when this happened in 1915 he is credited with having said that if the world war had not interfered a million Fords would have been manufactured within another two years. It has required five years instead of two.

Instead of reopening its Detroit plant Jann-

Digitized by Google

ary 3, the Ford company notified about 60,000 employes that the works would remain closed indefinitely. The only official explanation given was a copy of the notice posted throughout the plant and which reads as follows:

"When the Ford Motor Car Company closed its plant December 24, Christmas Eve, the factory employes were informed that it would remain closed for inventory, but would resume operations January 3.

"The company has now decided not to reopen the plant next week, but will resume operations as early as possible. The assembly plants throughout the United States will, however, continue in operation as usual."

Aside from this statement no one in authority either could be found, or, if found, was willing to give any further information. But one official said:

"I think that the less the newspapers and trade papers discuss situations of this kind the more wholesome the effect on the whole country. I agree with Judge Gary and other men who know, that the country never was in better shape than it is today and that this readjustment in hastening to a close and that we have passed the crux of the situation. Therefore, I deplore the tumult in which the press keeps public opinion. The uncertainty accomplishes nothing, where if situations of this kind were ignored, we would make headway much faster in our readjustment."

There are all sorts of reports as to the reasons for the sudden action of the Ford company in deferring reopening the Highland Park factory, especially as all the assembling plants throughout the country resumed operations this week. One man, who is a minor official, said that when the Detroit and River Rouge plants begin work again, which, according to him, will not be before the latter part of February, it will be on the new Ford car and truck, concerning which numerous reports have been circulated during the last three or four months.

The reason the assembling plants continue operations is because they will finish all the cars and trucks possible with the materials on hand and such other supplies as will be shipped from the main plant. This means that thousands of cars will be made and distributors will have for some time a fair supply. This, said the Ford man, would make possible the clearing of the main plant and making it ready to start on the new product.

In connection with this matter it might be said that several trade papers have announced within the last few weeks that a new Ford passenger car and a new truck are in the making, but these papers could not obtain an authorative statement to that effect from officials of the company. It is known, however, that one of these officials recently said that the Ford company was well alive to any emergencies and just as soon as it was found necessary to bring out a new car the new product would be ready. Which isn't very far from admitting that the rumors were not mere rumors.

$7,000,000 *Bonus Being Paid*

Coincident with the postponement of the reopening of the Detroit plant came the announcement that the company had started the distribution of the annual bonus under the profit-sharing plan which applies to the entire Ford organization. Between $7,000,000 and $8,000,000 will thus be distributed among 70,000 employes. The same day this was announced a report was published in some eastern newspapers to the effect that Ford might not "be able to pay the advertised bonus for some time to come."

Figures given out by the Ford company show that during 1920 a total of 1,027,677 Ford cars were made, of which number approximately 15 per cent, or in round figures, 154,000, were trucks. In addition, there were produced 69,123 Fordson tractors. These figures, whether for passenger cars, trucks or tractors, are considerable over 50 per cent above the pro-

AUTOMOTIVE ACTIVITIES RESUMED

The Packard, Cadillac, Paige-Detroit and Studebaker plants in Detroit have opened some departments with a few employes back at work. The Columbia plant will call back 200 men January 10, the Buick plant in Flint contemplates reopening January 10, and the Dort factory will resume operations February 1.

NEW FIRESTONE SALES OFFICIALS

L. G. Fairbanks, formerly manager of the steel products division of the Firestone Tire & Rubber Company, Akron, has been made sales director. G. A. Richards will have charge of Michigan manufacturers' sales and general activities in this state.

BARLEY MOTOR CHANGES NAME

The Barley Motor Car Company, Kalamazoo, has changed its name to Roamer Motor Car Company. The company, which is capitalized at $2,500,000, manufactures the Roamer automobile.

DUPLEX TRUCK STATEMENT

The annual statement issued by the Duplex Truck Company, Lansing, reviews the progress of the last year and the prospects for 1921. The report shows current assets of $1,137,851.86, with current liabilities of $538,436.29 and a surplus of $249,276.25. At the close of business in October the company charged off $200,0000 depreciation. A year ago the company "junked" $100,000 in "good will."

NEWTON HEADS APEX SALES

The Apex Motor Corporation, Ypsilanti, announces the appointment as sales director of F. T. Newton, who has had considerable experience in the automotive industry, being at one time assistant sales manager and later sales manager of the old Jackson Automobile Company, and for three years sales manager of the Lewis Spring & Axle Company.

Another newcomer in the Apex organization is H. F. Greene, district sales representative. Mr. Greene formerly was with such well known concerns as the Ford, Hudson, King, Metzger and the old E-M-F.

A. J. WHIPPLE JOINS REPUBLIC

A. J. Whipple, who has been general manager of the Diamond T Motor Truck Company, Chicago, has become general sales manager of the Republic Motor Truck Company, of Alma. Mr. Whipple is an old timer in the automotive industry and has been a director of the National Association of Motor Truck Sales Managers. He is now a member of the truck committee of the National Automobile Chamber of Commerce.

JACQUET'S NEW CONTRACT

The Jacquet Motors Corporation, Belding, has received a contract for 100,000 gas generators for the B. J. Steam Gas Generator Company, Grand Rapids. The concern also has made a deal whereby it has obtained the manufacturing and selling rights for this new device for the states of Michigan, New York, New Jersey, Kentucky and West Virginia.

WILL MAKE A NEW WHEEL

The Hanchar Wheel Manufacturing Company, capitalized at $1,000,000, has been formed in Toledo, O., to make a newly patented quick change automobile wheel. The concern has obtained for its plant the Consolidated Manufacturing Company's factory building. The officers are J. C. Fair, president and general manager; Ora Justice, vice-president; A. W. Shields, secretary, and J. F. Angell, treasurer. These officers and John Schook, H. G. Brewer and H. G. Brewington, make up the board of directors.

TIRE SALES IMPROVING

Business of the General Tire & Rubber Company, Akron, O., is steadily increasing, according to a statement by M. O'Neill, president. Mr. O'Neill is credited with stating that orders were increasing in 75 per cent of the country. Several other tire makers report a decided improvement in sales.

LANSING DELEGATES AT N. Y. SHOW

Lansing automotive manufacturers will be well represented at the New York national motor car show this month. The Reo Motor Car Company, the Olds Motor Works and the Motor Wheel Corporation officials and sales representatives will attend. Arrangements have been made for a special Pullman car over the Michigan Central by H. F. Harper, president and general manager of the Motor Wheel Corporation. The companies will have exhibits at the show.

NEW GMC DIRECTORS

K. W. Zimmerschied, C. F. Kettering, Dayton, O., and F. D. Brown have been elected directors of the General Motors Corporation. Messrs. Brown and Zimmerschied also have been named vice-presidents. Mr. Brown will be financial officer of the corporation. L. R. Beardsley has been made assistant secretary.

MEREDITH JOINS MAXWELL STAFF

As general works engineer of the Maxwell-Chalmers Company, Inc., which he has recently joined, Harry P. Meredith will have charge of building design of plants in Detroit, Dayton, O., Newcastle, Ind., and Canada. Mr. Meredith formerly was with the Curtiss Aeroplane & Motor Corporation, prior to that with the Pennsylvania railroad, and at an earlier date with the Cadillac Motor Car Company and du Pont, De Nemours & Company.

NEW YORK SHOW MEETINGS

In connection with the national automobile show in New York city, the week of January 8, the following meetings will be held: Foreign trade, patents, highway and motor truck committees of the National Automobile Chamber of Commerce, on Tuesday; N. A. C. C. directors Wednesday; Society of Automotive Engineers, Tuesday and Wednesday; S. A. E. carnival, Wednesday evening; N. A. C. C. annual dinner, Tuesday evening; S. A. E. annual dinner, Thursday evening; Automotive Service Association of New York, Monday.

FIRESTONE SALES FOR 1920

The sales volume of the Firestone Tire & Rubber Company for the year just closed is reported at $114,980,969.26, an increase of 26 per cent over 1919.

NEW WILLARD SALES MANAGER

The Willard Storage Battery Company, Cleveland, has appointed Howard S. Gardner, Kansas City, general sales manager. He was formerly with the Midwest Storage Battery Company, Kansas City.

DU PONT MOTORS MOVES

The Du Pont Motors Company has moved their production machinery and administration organization from Wilmington, Del., to Moores, a suburb of Philadelphia, where the new plant is located.

REUSHAW, REO DIRECTOR

R. C. Reushaw, who recently became general sales manager of the Reo Motor Car Company, Lansing, has been made a member of the board of directors.

EVERYBODY HOPES TO OWN A MARMON

For Sale—The prettiest Marmon Coupe in Michigan; driven less than 12,000 miles; has a recent excellent power plant and is fully equipped; everything in fine condition. Box W, Michigan Manufacturer and Financial Record, 611 Free Press Bldg., Detroit.

"NEW BRITAIN"
SCREW PRODUCTS DEPARTMENT
QUALITY SERVICE ECONOMY

THE confidence that we are in a position of unusual advantage to serve you in the matter of screw products has, we believe, a strong basis.

Our Screw Products Department is equipped with "New Britain" six-spindle automatic screw machines and other suitable machinery for handling all classes of large and small work.

The ability of the "New Britain" automatic to do accurate work—a logical result of correct design and substantial construction—is eloquently attested by their general use among automobile and other manufacturers.

As to productive capacity these machines have no peer. The greater tooling capacity of their six spindles eliminates the necessity for rehandling complicated work; enhances production of average work by subdividing the larger operations; and on the simpler work, makes possible the finishing of two or three pieces at each indexing. The advantage in output over other machines ranges from 50 to 200%.

In short, the "New Britain" Screw Products Dept. offers you a quality service at a cost made possible only through the employment of methods and machinery of extraordinary efficiency.

Phone our Detroit office for quick service.

TRANSPORTATION NEWS

Rail :: Commercial Hauling :: Water

Pittsburgh—The recent order for 200,000 tons of rail placed by the Pennsylvania Railroad Company is generally regarded in New York financial quarters as being another step in bringing about renewed confidence as to an early return of normal business. The order exceeds last year's almost twice over. It means that other roads, if they order proportionately, will assist in keeping many men from idling. Certain steel manufacturers have gone on record as saying 1921 will approach a high record in steel manufacture, adds the Boston paper. Conditions favor an advance rather then a decline in rails. Large orders from railroads are looked for within two or three weeks.

Washington—Hereafter railroads cannot buy supplies and equipment from corporations in which they are interested as organizations or through connections of officials. President Wilson has vetoed a measure which would have permitted interlocking interests, and which had been approved by the interstate Commerce Commission.

Detroit—Judge Tuttle, in federal court, has set January 17 as the date for the hearing on whether the present 3 cents a mile railroad fare in intrastate traffic shall be continued permanently. At the hearing 13 Michigan railroads will petition for an injunction restraining the state from enforcing the 2½ cents a mile rate provided by state statute.

Washington—In the matter of the complaint of Chatterton & Son, of Toledo, Ohio, against the rate charged on beans, in carloads, from Pere Marquette Railway stations in Michigan to various destinations, and receiving transit service at Toledo, the Interstate Commerce Commission has decided that the rate was unreasonable and has awarded reparation. The shipments involved were made July 1, 1918, and June 1, 1919. The complaint was listed as No. 11,309 on the Commission's docket.

Washington—The Illinois Central Railroad has filed application for permission to issue $6,953,000 of first mortgage bonds with the Interstate Commerce Commission. The railroad claims it has not been able to earn the 6 per cent provided by the Transportation Act.

Cost accountant, twelve years' experience in steel and metal working plants as cost expert, seeks permanent position with industry in Detroit manufacturing district. Thoroughly grounded in every branch of cost work. Address Box F, Michigan Manufacturer and Financial Record, Detroit, Mich.

D. T. A. Begins Campaign For Dump Truck Members

The Detroit Transportation Association has inaugurated a campaign to bring all dump truck operators into the Association. Fourteen Detroit and Wayne county truck dealers have co-operated with the Association by furnishing a list of recent buyers of dump trucks, and with this list to work with, two membership teams will begin canvassing.

For a period of 30 days the membership fee will be reduced to $1, and the monthly dues will be lowered to the same figure for 90 days. The city has been divided into two sections, one lying east of Woodward avenue and the other west of the avenue. Fifteen teams have been organized, one in charge of H. P. McDermott and the other captained by Darwin T. Smith.

The team captains are D. C. Gould, E. S. Barnett, Charles Nielson, O. G. Moebs, A. H. McCleary, A. J. Smith, George Harris, S. U. Blake, A. S. Locker, Joseph Bunting and Frank Smith. Several captains will handle more than one team.

More Changes Forecast In Ford Organization

(*Continued from Page* 13)

duction of any other manufactrner in thes same lines in the world.

Impressive as these totals are from the production point of view, it is the money involved in them, the value of the product, which is making Wall Street and other financial quarters take special notice of the Ford activities. While the Ford company does not give out figures concerning sales, it is possible, however, to get a fair estimate as to the business of the company from the sales prices of its products. Of the 1,027,677 cars made, approximately 722,279 might be listed as sold under the war-time prices, and the balance, or 305,398 cars, at the new pre-war prices. The old prices range from $525 for the chassis of the passenger car to $975 for the sedan; the new prices effective since September 21, range from $360 for the chassis to $795 for the sedan. From several Ford dealers the writer is led to believe that a fair and near correct sales average price for the sales up to September 21, is $575 and for those for the balance of the year $500. On the basis of these figures the sales value of the Ford cars up to the time of the price reduction was $415,310,425 and the value of those cars made beginning September 21, $152,699,000. Thus the total list price value of the 1920 Fords was $568,009,425, possibly more, but not very likely less.

As for the tractors, their old sales price was $850; the new price since September is $790. Of the 69,123 tractors made, it is said that 60,000 had been completed before the price reduction. It thus seems reasonable to give the tractors an average sales price of $800, which would mean total sales aggregating $55,298,400 and bring the total value of the manufactured cars and tractors to $623,307,825.

But there is still another important part of the Ford business—that of parts for its cars and tractors. On this subject nothing very definite has been obtainable, but here again, if the opinion of Ford dealers is anywhere nearly accurate, it may be said that the Ford parts business during the last twelve months totaled at least $25,000,000. This added to the other sales brings the total of the Ford sales at listed prices up to $648,307,825.

NEW AUTO INSURANCE COMPANY

Licensed to do business in Michigan, Illinois, Indiana and Ohio, the Michigan Automobile Insurance Company, Grand Rapids, capitalized at $250,000, has been organized, succeeding the Michigan Automobile Exchange. The officers are: President, Herbert B. Webber, Grand Rapids; vice-president, Brinton F. Hall, Belding; vice-president, Harlan J. Dudley, Grand Rapids; secretary-treasurer, Henry J. Kennedy, Grand Rapids.

VULCANIZING CONCERN FORMED

The Brackett Rubber Footwear Vulcanizing company has been formed by Carl Brackett, Lansing, to put on the market a new device which is being manufactured at the plant in that city. It is a simplified vulcanizing process which patches all rubber footwear quickly and economically. Mr. Brackett has applied for a patent. About 50 machines are in use. They are being sold to shoe repairers. Michigan territory will be served before a national campaign is started.

The Organization Committee,
Detroit Chapter of the

NATIONAL ASSOCIATION OF COST ACCOUNTANTS

will hold a MEETING in the BOARD OF COMMERCE Building, on JANUARY 12th, 1921, at 8:00 P. M.

WILLIAM M. LYBRAND, of Lybrand, Ross Bros. & Montgomery, President of the NATIONAL ASSOCIATION OF COST ACCOUNTANTS, will address the meeting.

J. P. JORDAN, Vice President and Director of Operation C. E. Knoeppel & Co., Inc., will present a paper on

THE OPPORTUNITY OF THE COST ACCOUNTANT

Admission is free, but due to the limited capacity of the hall, will be by ticket. Write or telephone immediately for tickets.

CONRAD B. TAYLOR, Secretary,
924 Book Building,
Detroit, Michigan.
Telephone Main 8848.

The urgent problems of the moment, inventory valuation; true cost in periods of subnormal production; expense control from the executive standpoint, and matters of equal interest, are discussed at the monthly meetings of the Association.

ELREDGE AGENCY IN MERGER

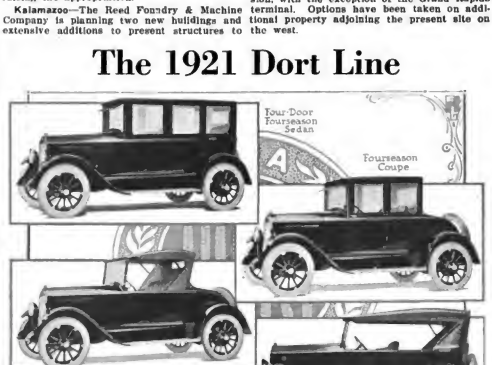
Frank M. Eldredge, president of the Frank M. Eldredge Company, Detroit, announces the merger of his business with that of the Brearley-Hamilton Company, Grand Rapids. The latter advertising agency renders national advertising and merchandising service for a goodly list of accounts.

It will maintain branch offices in Detroit, in the Stevens building, formerly occupied by the Eldredge company, with Mr. Eldredge in charge. Mr. Eldredge has been prominently identified with the advertising fraternity of Detroit for the last eight years, both in an executive capacity for various Detroit automotive corporations and in business for himself for the last three years

INDUSTRIAL BUILDING

Progress, Projects and Contracts of the Week

Washington—Senator Calder is the author of a bill which would establish a Bureau of Construction and Housing as a part of the Department of Commerce, with a director paid a salary of $8,000. The work of the bureau would be to establish a uniform code of building regulations and assist in home building.



Detroit—Following Mayor Conzens' veto of the action of the common council in rejecting all bids for work on the Belle Isle bridge, the council has postponed action on bids indefinitely. The aldermen desire to wait until the April election to get a vote on the question of raising the appropriation.

Kalamazoo—The Reed Foundry & Machine Company is planning two new buildings and extensive additions to present structures to provide facilities for manufacturing a new kerosene and gasoline engine for Reed tractors. Construction work will be started in the spring.

Detroit—Expenditures for bridges and roads in Wayne county during 1921 will total $4,200,000, it is announced. The road commissioners have goodly supplies of materials on hand and are prepared to undertake the largest road building program in the county's history.

Hastings—The Michigan Central Railroad has authorized the expenditure of sufficient funds at Hastings to erect a new station, 23 by 92 feet, which will be the finest on the division, with the exception of the Grand Rapids terminal. Options have been taken on additional property adjoining the present site on the west.

The 1921 Dort Line

THE 1921 DORT MOTOR CARS

DISTINCT among features of the New York automobile show which opens today is the first appearance of the new Dort family, rather a radical departure from the accepted lines of this car. In this Dort exhibit, which is the same as that which will be displayed at the Chicago show later in the month, then at the Detroit and other dealer shows, are four types—sedan, coupe, touring car and roadster—all mounted on the same chassis.

What commands attention is the new and striking lines of all bodies. It has taken two years to bring into existence this new Dort family. J. Dallas Dort and William A. Henderson, the latter for seven years chief body designer for Holbrook & Company, co-operated; bodies were designed, built and rebuilt, and finally came the line now in production. Incidentally, Mr. Dort induced Mr. Henderson, who is said to have created more special bodies for notables of this country and Europe than any American, to accept the management of the Dort body plant at Kalamazoo.

The radiator on these new Dort models is indicative of a certain European maker, but the cars are exclusively Dort. A soft green, designated as Dort green, is the standard color, chassis and fenders being of black enamel.

There is an abundance of room for driver and passengers, together with greater storage space. Side curtains on open models open and close with the doors. Appointments of the sedan and coupe are complete. Carpets and silk curtains match the upholstery, windows are of plate glass and the windshield built-in, with rain visor adjustable for ventilation.

The four-cylinder Dort motor, 3½ by 5 inches, is made more efficient through minor refinements which have suggested themselves. There is a change in tire sizes, the new line calling for the 31 by 4 inch size, front and rear.

Horace H. Lane Takes Two Business Partners

Horace H. Lane, one of Detroit's prominent industrial engineers, has announced the association with himself of H. Daziel Davenport and A. A. Peterson. The new concern will be known as Lane, Davenport & Peterson, with offices at 2320 Dime Bank building, and will, of course, engage in a general architectural and engineering practice.

HORACE H. LANE

Mr. Lane, the senior member of this firm, began his career as a machinist's apprentice with the Cambria Iron Company, at Johnstown, Pa. It was not long before he was at the head of a concern manufacturing a line of machinery and doing a general engineering business. A few years later, Mr. Lane was engaged by a large engineering concern in New York city to supervise the design and erection of a number of industrial plants and power houses throughout the country. His first experience near Detroit, some twenty years ago, was in connection with the construction of the power plant of the Rapid Railway at Mount Clemens. The following year he had charge of the construction of the steel car plant and power house for the American Car & Foundry Company, and subsequently he handled the construction of the power plant of the Detroit Edison Company, at Delray. Among the other industrial establishments he has built are the $2,000,000 plant of the Eastern Car Company, near Halifax, N. S., the Haskell & Barker Car plant, at Michigan City, Ind., the Scripps-Booth Motor Car factory, Detroit; and the Wyandotte plant of the Detroit Ship Building Company.

H. D. Davenport, the second member of the firm, graduated in architecture at the University of Michigan and afterwards completed his training abroad. He has been engaged in practicing his profession for a number of years in Grand Rapids and Detroit.

A. A. Peterson, the other member of the new organization, is a structural engineer with several years' experience in the structural design of steel and reinforced concrete buildings. He is a graduate of Purdue University and has been associated with Mr. Lane for the last nine years in the design and layout of manufacturing buildings of all types.

Mr. Lane is a member of the American Society of Mechanical Engineers and a past president of the Detroit Engineering Society, while Mr. Davenport is a member of the Michigan Society of Architects and Mr. Peterson's name will be found on the roster of the Detroit Engineering Society.

DETROIT TRUST ELECTION

The Detroit Trust Company has re-elected or reappointed the following officers: President, Ralph Stone; vice-presidents, Sidney T. Miller, James E. Danaher, Lawrence K. Butler, Charles P. Spicer, McPherson Browning, Harry L. Stanton; secretary, Charles E. Hilton; treasurer, Fred Wirson; assistant to the president, Julius C. Peter; assistant secretaries, Frederick J. McGavin, Albert A. Chilman, Julius H. Moeller; manager of public accounting department, Ralph C. Miller; manager of real estate department, David T. Lorimer; manager of sales, bond department, E. K. Matlock.

It is announced that H. A. Oswald, chief engineer of the Hamilton Motors Company, Grand Haven, will soon bring out a new passenger car.

Much time can be saved by operating the tools in both turrets simultaneously. Here is a job done on a Warner & Swasey No. 4 Universal on which almost 50% of the time was saved in this manner.

A Production Engine Lathe

This is the right term for the Warner & Swasey No. 4 Universal Turret Lathe, as it does all that an Engine Lathe can do, and a great deal more. The carriage with feeds in both directions and equipped with the standard taper turning and chasing attachments, makes it capable of doing all kinds of work accurately and quickly.

Two No. 4 Universal Turret Lathes at the Kelsey Wheel Company, Detroit, have just replaced six Engine Lathes in their tool room. Other tool rooms in great number use these machines for blanking out taps, reamers and other tools that take so much time on Engine Lathes.

Are you doing work on an Engine Lathe that should go on a Warner & Swasey No. 4 Universal Turret Lathe?

MICHIGAN MANUFACTURER AND FINANCIAL RECORD

EDITORIAL

DETROIT, SATURDAY, JANUARY 8, 1921

Mr. Fordney's Reassuring Statements

IT IS DOUBTFUL whether the members of the Wholesalers' Bureau of the Detroit Board of Commerce who listened to Congressman Fordney's address last Friday evening set the fullest value upon the message which the chairman of the ways and means committee of the House of Representatives carried to them and through them to the country. Mr. Fordney is so much of a Michigan product, and his eminence in national affairs has changed him so little from the "Joe" Fordney whom Michigan knows and loves so well, that the easy-as-an-old-shoe method of discussing great national problems may not have been invested with enough magnificence to be considered in the serious light which it deserves. But Congressman Fordney has arrived at the position in our government said to be only second to that of the President, the chairmanship of the committee which practically determines how Americans are to be taxed for federal purposes. Moreover, the House is in political accord with him, and the chairman of the committee on appropriations of that body is in economic accord with him. When the committee on appropriations is in harmony with the ways and means committee of the popular branch of our Congress, any program of national expenditure, whether it be one of economy or extravagance, may be carried out. When both are in accord in the direction of national economy in administration, it may be set down as a good deal of a certainty that they will carry out their program. When, in addition, the executive department of the country is also in political accord with the Congress, it becomes even more certain that such a program will be carried to final success. This condition will exist after the fourth day of March, which is the date at which Mr. Fordney's program promises to go into effect.

Let us examine this program, as laid down by Mr. Fordney, and note the promise that it contains for American business. Its first point is that the excess profits tax, conceived as a war measure, and applied as such, may be and will be repealed, because the occasion for it has passed away. This, in itself, means much to American business, because between the authorization of the tax by statute and the administrative regulations which have been applied to it, the temptation to American business has been to spend money on things which would not normally be considered as prudent expenditure, the excuse being that if the money is not so spent, much of it will go to the Government for taxes. The other economic effect of the tax was that the incentive to profit which has heretofore driven American business ahead has been in large part withdrawn, because the profits once realized, are seized by the Government for its support, and they do not accrue to the people whose industry, energy and foresight have led to their making.

Secondly, the program as outlined, is one of economy intended to bring the expenses of the Government down to three and a half billions a year, of which a billion, practically, is the interest on the national debt, as funded in bond issues, and the unfunded debt now represented by certificates of indebtedness. The maximum cost of the federal government in the pre-war days was a billion dollars a year. The work of government with an increased field of operation and an increased population should not, in Mr. Fordney's scheme, run into a sum more than twice the old cost. To this a billion of interest and a half billion of contingencies are added, making three and a half billions. It seems quite within the power of the American people to give up this sum annually to the federal government without to great burdening of the annual national income. This is a practical and definite program to which the people should give their most grateful assent.

Thirdly, it is the announced fiscal policy of the ways and means committee to look to the executive and legislative branches of the Government to provide for the refunding of the obligations of the Government over a long period of years, rather than to provide for their payment by the immediate present generation. The refunding of our governmental obligations over a long period has been uniformly accompanied by a reduction in the interest rate, which makes them acceptable to investors. The only question involved in the conversion of our present debt is its magnitude, but we are and the world is becoming more and more accustomed to large figures in finance than was the case in the past. There is no reason for burdening the present generation with the costs of the war, if its purposes and effects were and are to be what they have been so magniloquently described. The refunding of the debt on a half-century basis is in accord with good financial principles and good tax economics, so far as spreading the costs on the largest number benefitted is to be considered. At any rate, the payment of the debt is to be removed from the demands to be made on the American people in the immediate future.

Fourthly, we are to have a protective tariff, immediately; this to be accomplished by the re-enactment of the Payne tariff as soon as Congress meets in extra session. This procedure is to avoid the economic difficulties into which we invariably get during the period of discussions about the tariff which are sure to result in higher schedules of duties. These difficulties have come from the dumping on our shores of vastly greater quantities of foreign products than we can currently consume, in anticipation of the higher prices to which they will be marked up when the advanced schedules are made effective. This procedure, from the standpoint of those who believe in a protective tariff—and that group seems to include a vast majority of the people—is a safeguard which has the merit of inventiveness and good management.

Speaking of the tariff, Mr. Fordney has brought out a new point, and one which, coming from so good an authority, must be treated with due respect. We have been treated to a good deal of advice along the line that the protective tariff must be rather gently created if we are to allow our foreign creditors to sell us their goods and pay their debts. Our creditors are Europeans, and it was largely against them and their productions that the schedules of former tariff measures were directed. But Mr. Fordney declares now that it is within the knowledge of government and business that our future competitors are to be the nations of the Orient, whose peoples have a low standard of requirements for living and housing, who have a compensatory low standard of wages, and whose ability to produce in volume and with great cheapness threatens the American standard of living even more than did the low standards that prevailed in Europe before the war and that continue to prevail, even in worse degree. That being the case, the tariff must be adjusted to a point which will lay foreign goods down on our shores in even competition with our American producers. At that point either the quality of the goods laid down or their need by our consumers become their selling advantages, a condition with which no American and no foreign producer should find much fault.

One other point not generally known to our people is made known by the distinguished chairman of ways and means. That is that by virtue of Treasury decisions we have been levying the duties which are now collected on incoming foreign goods on their foreign prices and in terms of the depreci-

Digitized by Google

ated sterling pounds, German marks, French francs and Italian lira which now prevail. In other words, the very spirit of the Underwood tariff is being violated, it being the intention at the time it was drawn that the duties for which it provides should be paid upon the old-time values of foreign monies. A reversion to a condition which will value articles imported at the rates which were existent under the former stable system of exchange will mean very much in revenue and a great deal in principle in dealing with our importations.

Mr. Fordney has set forth a coherent and orderly scheme of national revenue-getting and of protection to American industries during the period of readjustment. Even those who do not accept the theory of protection as academically sound must recognize that the country is committed to it for a long time to come, and that, if it is to be applied, it must be applied honestly and intelligently to produce the largest amount of revenue by indirect taxation, to take the place of the direct forms of taxation to which the country has become so unpleasantly used. The message which the chairman brought to the wholesalers of Detroit was the first coherent one which has been given to the country. It comes from an authoritative source and is to be believed.

Quite incidentally, it may not be out of place to remark that the two American statesmen who know most about federal taxation in this country today are Senator Reed Smoot and Congressman Joseph W. Fordney.

Labor Unions and the Anti-Trust Law

THE DECISION of the United States Supreme Court, this week, that labor unions are amenable to the provisions of the federal anti-trust laws when they conspire to boycott employers or induce others to boycott them in an effort to force compliance with organized labor's demands, should be hailed as a victory for good government, inasmuch as the principle underlying the decision is that there can be no immunity under the law for any man or group of men who set out to commit unlawful acts. In other words, the court's decision merely reaffirms one of the fundamental tenets of Americanism—a tenet which the labor unions had been seeking to avoid on a technicality.

It has been argued by labor's representatives—in this case the lawyers representing the International Association of Machinists, an organization which boycotted the Duplex Printing Press Company, of Battle Creek, Mich., and thus established the conditions on which the application for injunction originally was filed—that they were immune from prosecution under Section 6 of the Clayton Act, which sets forth that the "labor of a human being is not an article or commodity of commerce." It also was contended during the course of the litigation that under Section 20 of the same act, the courts were specifically restrained from issuing injunctions such as that for which application was made. In answer to the contention with respect to Section 6, the majority opinion of the court says that the law assumes that the normal objects of a labor union are legitimate, and that there can be no immunity from prosecution when the union departs from its legitimate objects and engages in a conspiracy or combination in restraint of trade. With respect to Section 20 the court's decision is equally clear, being that "there is nothing here to justify defendants or the organizations they represent in using either threats or persuasion to bring about strikes or cessation of work on the part of employes of the complainant's customers or prospective customers—and of thereby constraining complainant to yield the matter in dispute."

The position of the minority of the court that the acts complained of were in reality a part of the strike at the Duplex plant and therefore did not fall within the scope of the anti-trust laws, and that, furthermore, while the machinists' union undoubtedly was pursuing a course which would injure the employer's business, it was not doing so maliciously, appears a narrowly technical interpretation of the law when one sets it over against the principle governing the majority opinion—that nothing must be allowed to defeat the broad intent of the law, which is to prevent restraint of trade through unlawful acts.

The decision likewise is important in its specific application, in that it means that the labor unions are to be held accountable when they resort to strong arm methods of this category. The next step must be the incorporation of the unions so that they can be held to their contracts, just as in the case of employers. When that is done, there will be less irresponsible leadership among organized labor.

Short Measure Stuff

SOME NEW YEAR RESOLUTIONS

I will not abdicate again—if I can help it.—*King Constantine.*

I will not keep Mr Burleson at his present job.—*President-Elect Harding.*

I will not be satisfied with less than $8,690,000 for the University of Michigan.—*President M. L. Burton.*

I will not be satisfied until some of these cut stone fellows are breaking rocks.—*Samuel Untermeyer, leading the New York Building probe.*

I will not throw any more pies until the price goes down.—*Charles Chaplin.*

We will not let the street car question get out of politics.—*Detroit Street Railway Commission.*

This jews-harp is great stuff.—*Circulation Manager, the Dearborn Independent.*

We will welcome contribs, the more the merrier.—*Us.*

* * *

The Holiday Grouch was listening to the bells and whistles welcoming in the new year.

"That's a lot of fuss to make over the first of the month," he said. "The Christmas bills will make 'em groan louder than this."

* * *

IF THE ANCIENTS HAD KNOWN SLANG

The prodigal son was going up the front steps.

"What's ma got in the house to eat?" he said.

"Roast veal," said the indulgent father, intriguingly.

"That the best she could do? What was the matter with killing a chicken or a duck. Don't you know how fond I am of chicken?"

"Nix," said the indulgent father. "With eggs worth a dollar a dozen, it just couldn't be did. The stockyards are so full of cattle that they are a drug on the market. So our little fatted calf had to be the goat."

* * *

What has become of the old fashioned bob sled?

* * *

I'm glad when winter
Starts to go,
Because I hate
To shovel snow.

* * *

The anti-Semitic Campaign seems to be developing into an anti-Ford one.

* * *

Are any of the Christmas toys left unbroken?

* * *

SLANGY

I'd like to give
The man a crack,
Who speaks of coin
But calls it "jack."
—*Detroit Free Press.*

I'd prove to you
By my lean wallet,
It doesn't come,
Whatter I call it.

* * *

Now the Congress has passed a bill over the President's veto. The legislative branch is in such a state of mind toward the executive that we doubt if it would even accept a resignation from Mr. Wilson.

* * *

Have you been mentioned for a cabinet position yet?—*A. F.*

FINANCIAL

THE BUSINESS OUTLOOK

By PHIL S. HANNA

ONCE UPON A TIME a certain mule loaded with bags of sugar stopped at the middle of a bridge to gaze down into the water. His load was heavy and the water looked inviting, so he plunged in. Before he reached shore the sugar had dissolved and he went his way, rejoicing at the success of his venture in disposing of a disagreeable load. Next trip over that bridge the mule plunged in again, hoping to repeat the trick; but, alas, this time he was loaded with sponges, which sucked up water and he was drowned.

There is a striking likeness between this story and the act of Congress in reviving the War Finance Corporation; and a possible prophecy. While another billion of new credit is being used the next few months, business should respond readily. Many debts will be paid, many men given work, the country will have many of the appearances of revived business. At any rate it will give us a chance to find out whether the price declines have been the result of economic laws or, as the farmers claim, a conspired result brought about by gamblers in food and commodities. I am of the opinion, however, that the result of it all will be mainly to put off pay day and that the reaction from all such artificial stimulants such as this eventually will offset any temporary benefit therefrom.

No one seems to know just where the helpful billion is to come from, except in a busy way that the United States Treasury has the means at its disposal to furnish $500,000,000 capital for the War Finance Corporation. The Treasury already has announced a deficit for the current fiscal year estimated at $2,000,000,000, but never mind that, for that deficit estimated for the fiscal year 1921-22 is going to be only $1,500,000,000. The Treasury, it is true, has a book credit in favor of the old War Finance body to something like $375,000,000, but this is of little avail if the Treasury is without the surplus funds; but let's go along and see where the $500,000,000 capital is to come from.

The Treasury, not having funds, will turn of course to the Federal Reserve Banks and some of the large commercial banks, and offer its Certificates of Indebtedness. The Reserve Banks can take the certificates and merely credit the sums to the Government, an easy operation, but apt to result in the end in a lowering of the gold ratio. But never mind that part of it. The commercial banks which take the certificates either have to deny their customers an equal amount of credit or go to the Federal Reserve Banks and replace the credit granted to the Government through purchase of the Treasury Certificates. Thus far we have floated the War Finance Corporation again with $500,000,000 capital (all directly or indirectly furnished by the Reserve Banks) and have asked the Secretary of the Treasury to assess another $500,000,000 taxes against the people generally to provide funds for the corporation, which is to do what? First it will issue bonds to an amount for which it has demand for funds—say $1,000,000,000 to start with; and there being so much money lying loose these days awaiting investment, the bonds will, of course, not be taken by the general public, and not likely anyhow, because we should not ask the farmer to pay more than 7 per cent; with the result that the bonds will find their way into the Federal Reserve Banks and the Reserve Banks will charge up so much of bonds on the asset side and credit an equal amount on the deposit side. Presto, the structure has been reared and is ready for business!

The first problem to confront the Corporation will be to find a market for the crops which the farmers are now holding. That will be easy, but the task of finding buyers in foreign lands whom we can trust is another proposition, and we have in the authority of the Treasury Department that this is an entirely new venture for the Finance Corporation, except for a matter of $46,000,000 of exports (one-half of which were business done by General Electric, International Harvester and Bethlehem Steel Corporation) which was handled after the Armistice. Official returns now show that we have exported about 200,000,000 bushels of our wheat. The July 1 total was 950,000,000 bushels and domestic needs are considered as 630,000,000 bushels. Six hundred and thirty plus 200 equals 830, and if we keep 100,000,000 bushels in reserve against possible crop failure, it would seem that our 950,000,000 bushels July 1 is pretty well spoken for. The unsold part of the 1919 crop on this basis of figuring would be available for export. Thus, so far as wheat is concerned, the war finance body will have to look at home for the purchaser of the 630,000,000 bushels, and it is highly doubtful that domestic purchasers are going to pay a higher price to the farmer just because credit has been made more plentiful. But, "On with the dance;" if, lack of credit is all that has been holding the buyer back, we shall at least have that remedy supplied. Don't forget pay day, however, and that the capital for the finance body is furnished by the taxpayers and that the expenses of the same body also come out of taxes; and not the least to remember is that any losses which the Corporation may sustain by reason of poor management must also come out of taxpayers.

The outlook is much brighter this week. Liberty bonds made a nice recovery, foreign exchange on every point is up except Austria, and in that case variations beyond .00255 don't count for much, anyway. Bank clearings are smaller in volume but are following closely the trend of a year ago. The bond markets made a substantial advance, but this is explained possibly because many who are afraid of having dividends on stocks cut off have sold stocks and are buying bonds. The stock markets started to come back the last day of 1920 and maintained the gains quite well until Wednesday.

Money in Detroit has not changed materially, although it was gratifying to note from bank statements (state banks December 28 and national banks December 29) that the community has got down to business using more than 3 per cent on the average of the total deposits since September 8. The closing of the Ford Highland Park plant will be a temporary blow to Detroit. Many smaller concerns supplying parts have been relying almost entirely on the orders from this company for sustenance, but the announcement of opening of many other plants both in Detroit and throughout the state show the trend of things, and what we lose by the Ford closing now may be chalked up against what we gained during November and December when it was running while many others were closed.

GRAND RAPIDS BANKS PAY $110,250

The Old National Bank, Grand Rapids, paid 5 per cent, making 10 per cent for the year, and paid the taxes. The Kent State Bank paid the regular 3 per per cent semi-annual, 2 per cent extra, making 16 per cent for the year. Fourth National and Commercial Savings paid regular monthly of 1 per cent. Grand Rapids Savings and South Grand Rapids State paid regular quarterly of 3 per cent. Michigan Trust paid regular 6 per cent quarterly and 8 per cent extra on the old capital and Grand Rapids Trust paid 21 per cent semi-annual. Kent State paid a 5 per cent semi-annual bonus to employes on Christmas and the Old National paid a 10 per cent bonus. Other banks paid bonuses in varying amounts.

National Bank Dividends in Stock Held Illegal

Acting Attorney General Frierson has rendered an opinion to the Secretary of the Treasury holding that stock dividends by national banks are illegal. The text of the opinion follows:

"Provisions of the Revised Statutes provide for an increase of capital from time to time, but no increase of capital shall be valid unless the whole amount of such increase is paid in, and notice thereof has been transmitted to the Comptroller of the Currency, and his certificate obtained specifying the amount of such increase of capital paid in with his approval thereof, and that it has been duly paid in as part of the capital of such association.

"It is thus enacted that no increase in capital stock shall be valid unless the amount has been duly paid in as part of the capital of such association. It would seem, therefore, that the mere conversion by a transfer of entries on the books of profits owned into capital stock and thus keeping in its business permanently what it previously was at liberty to distribute among stockholders, is not equivalent to paying in an equal amount of money, as a part of the capital of the corporation. No part of it has been paid into the corporation, and I cannot think that the conversion of it into capital stock will be an increase of capital in the manner provided by Acts of Congress.

"The foregoing is the construction which the Comptrollers of the Currency have in the past uniformly placed upon these statutes. If I were less sure of the conclusion I have reached, I think this long-continued construction placed on the law by the administrative officers would be entitled to sufficient weight to justify my conclusion."

C. R. WILSON STOCK DIVIDEND

Directors of the C. R. Wilson Body Company, Detroit, in annual meeting December 29 authorized a 300 per cent stock dividend to all stockholders of record December 29. In spite of financial depression this concern has just passed the biggest year in its history, and its present financial excellence is borne out by the authorization of this large dividend.

In the year just passed the company expanded its plants to three times their former capacity, building additions and installing new equipment. The executive officers are looking forward to an even greater year in 1921. There is now a constant increase in orders, with indication that the demand for bodies will step up to tax the plant's capacity by the spring of the year.

Michigan Bond Items

The city of Detroit is advertising for bids on sewer and filtration plant bonds to the amount of $14,000,000.

The First National Company, Detroit, is offering $33,000 of Marine City 5 per cent public improvement bonds to yield 5.40 per cent, and due serially up to 1948.

Because it is believed the Wayne county supervisors have no authority to issue bonds without an enabling act by the state legislature, the construction of the West Jefferson avenue and Fort street bridges over River Rouge has been postponed once more. Wayne county electors have twice voted these bond issues.

A resolution that the proposition of bonding the city for $45,000 to raise money to pay for pavings streets of Charlotte be submitted to the voters at the next general city election to be held April 4, 1921, was adopted by the city council at last week's meeting.

The city of Saginaw is taking steps to issue $5,000,000 of bonds for the purpose of completing the bay water project. A bill is to be prepared to amend the home rule act so that it will be possible for a city of Saginaw's class to bond for 8 per cent of the assessed valuation for water works plants, says the Saginaw News-Courier. The home rule act limits to 2 per cent of assessed valuation the amount of bonds any city of 50,000 or more population may issue for the construction or purchase of any public utility.

Cerro de Pasco Copper Company stockholders have approved the issuance of $8,000,000 in 10-year, 8 per cent convertible bonds.

United States Rubber Company 7½ per cent 10-year definite bonds will be delivered to subscribers on surrender of the temporary bonds to the United Mortgage & Trust Company, New York.

NEW DIME SAVINGS BANK, HAMTRAMCK

According to present plans, the new Dime Savings Bank of Hamtramck will open for business January 17. Officers are Walter L. Dunham, president; T. W. Palmer Livingstone, vice-president, and Frank Winiker, cashier. Winiker, who will be actively in charge of the bank, has been general teller at the main office of the Dime Savings Bank for some years. The board of directors is comprised of Messrs. Dunham and Livingstone, together with Jas. B. McKay, Karl Steilwagon and Edward Herzog. Capital stock will be $100,000. The new bank will occupy a new building at Holbrook and Lumpkin avenues.

The Dime Savings Bank of Detroit will open a new branch, Monday, January 10, at Dix and Artillery avenues.

TRANSFERRED TO GRAND RAPIDS

H. E. G. Clarke, who for a year has been Kalamazoo sales manager of the Shiffet-Cumber Company, investment banker, has accepted the managership of the Grand Rapids offices of the company. The Grand Rapids office has been established for a number of years and is one of the largest in the state.

IRONWOOD BANK DIVIDENDS

The Merchants & Miners State Bank of Ironwood has paid 5 per cent. Gogebic National paid the regular 5 per cent and an extra of two per cent, besides a Christmas bonus for employes. Annual meetings of the other Ironwood banks will be held in January.

American Business!
Forward—*March!*

The advance of American business into the markets of the world never halts. Some line is always moving forward. Despite various obstructing circumstances General Demand, commanding the economic situation, has given the order "Forward March!" to the whole industrial army—agriculture, manufacture, merchandising, transportation.

Chicago, in strategic position, reflects the business conditions of the nation. In Chicago, The Continental and Commercial Banks are at the financial service of American business, equipped and eager to aid in the great forward movement.

National and international facilities make for these banks an important opportunity for serving American business.

How the Banks Stood By Business in 1920

(*Continued from Page 6*)

month from July 2 to August 6. On November 5 the curve started down, but on December 17 it started up again and the last report at hand, December 2, showed an increase of notes outstanding. Federal Reserve notes expanded from $2,914,368,000 January 9 to $3,344,000,000 December 17.

EXTRA DIVIDENDS PAID

Stockholders in the combined First & Old Detroit National Bank, Central Savings Bank and the First National Company, Detroit, received an extra dividend of 2 per cent, December 31, in addition to the regular quarterly dividend of 3 per cent. This makes the annual return for 1920, 14 per cent. The banks pay all state, county and Detroit city taxes against their shares of stock, except those owned by stockholders residing in Wayne county outside of Detroit, to whom a proportionate payment is made in cash.

COUNTY CLERK BECOMES BANKER

Jay Binning, until January 1 clerk of Jackson county, will become a member of the staff of the National Union Bank, Jackson, instead of going into the state banking department, which service he intended to take up. Before his election as county clerk Mr. Binning was connected with the Jackson State Savings Bank.

COMPANIES AND DEALERS APPROVED

At meetings of the Michigan Securities Commission, December 9, 16 and 23, 1920, the following companies and dealers were given approval:

Companies—Converse Rubber Shoe Co., Malden, Mass.; Chattanooga Coke & Gas Co, Chattanooga, Tenn.; Louisville Gas & Electric Co. (notes), Louisville, Ky.; Michigan Motor Sales Co., Saginaw, Mich.; Hercules Corporation (notes), Evansville, Ind.; Channell Chemical Co., Chicago; United Fruit Growers of California, Bluefield, Mich.; St. Antonio Mining & Exploration Co., Sault Ste. Marie, Ont., Acme Beet Harvester Co., Alma, Mich.; McLaren-Sleight Corporation, Niles, Mich.; Hayes-Ruppel Manufacturing Co., Grand Rapids, Mich.; Municipal Pig Farms Corp., Grand Rapids, Mich.; Peerless Novelty Co., Grand Haven, Mich.; National Foundry & Machine Co., Ypsilanti, Mich.; Chattell Loan Co., Grand Rapids, Mich.; Detroit Graphite Co., Detroit Mt. Clemens Truck Body Co., Mount Clemens, Mich.; Boyle Ice Co. (bonds), Chicago; Hunter Co., Inc., Niles, Mich.; Garwood Electric Co., Detroit; McMullen Machinery Co., Grand Rapids, Mich.; Samuel Joseph (bonds), Detroit; Midland Gravel Co., Midland, Mich.; La Salle Steel Co. (bonds), Chicago, Arthur E. and Wm. A. Fiarl (bonds), Detroit; Auto Locking Robe Rail Co., Lansing, Mich.

Dealers—Roy A. Winslow, Kalamazoo, Mich.; Central Bond & Mortgage Co., Chicago; Royce E. Thomas, Bay City, Mich.

The applications of the California Hotel Company, Pasadena, Cal.; "Kum Bak" Co-Operative Stores Company, Detroit, and Security Oil & Refining Company, Scottsville, Ky., were disapproved.

Licenses of the Friend Motors Corporation, Pontiac, and Curran-Detroit Radiator Company, Detroit, were revoked.

Elston & Company, Chicago, were reinstated.

INTER-STATE BUSINESS REINSURED

The Inter-State Fire Insurance Company, Detroit, has completed an arrangement with the Commonwealth Insurance Company, New York, whereby all its agency business has been reinsured as of December 31, 1920, which enables the Detroit company to release a large part of its unearned premium reserve and add materially to the surplus. Through the agreement made with the eastern company it will also be possible for the company to increase its lines on desirable risks.

INCOME TAX RULING

Merchants and manufacturers may adopt "cost or market, whichever is lower," as a basis for valueing their inventories for 1920 income tax under regulations issued December 30 by the Bureau of Internal Revenue. The regulations also provide that the difference caused by the fall of price during the year may be deducted in arriving at the value of the stock.

UNION TRUST CHANGES

B. H. Manning, who has been with the Union Trust Company, Detroit, 18 years, as manager of the real estate department, has been elevated to the position of vice-president and real estate officer. Charles H. Adams, Merrill C. Adams and Harry Slater have been elected assistant vice-presidents and John A. Reynolds and Lawrence J. Toomey appointed assistant secretaries.

BYLLESBY'S DETROIT OFFICE

H. M. Byllesby & Company, investment bankers and property managers, Chicago, have announced the opening of a Detroit branch, in charge of T. E. Flanegin, formerly with Blair & Company. Byllesby & Company were one of the pioneer operators in public utility securities and have a long list of successful flotations to their credit.

NEW N. Y. C. FINANCING

An agreement has been executed supplemental to the New York Central Railroad Company Equipment Trust of 1920, under which the Guaranty Trust Company of New York is trustee, providing for an authorized issue of $6,420,000 par value deferred 6 per cent equipment trust gold certificates to be dated as of December 23, 1920, and to mature serially December 23, 1921, through 1935.

In Detroit It's the

SECURITY TRUST COMPANY

FORT AND GRISWOLD STS. CAPITAL AND SURPLUS $1,000,000.00 DETROIT

"Callable at ____"

It is reasonable to assume that as soon as money rates become stabilized—and the time is not far distant—many of the borrowers of capital who have been paying 7% and 8% will exercise the "callable" option of their notes and other obligations.

In fact it would be poor business judgment for these borrowers not so to do.

This redemption clause—prevalent in the high rated securities—defeats the purpose of investors who seek a steady yield over a period of years.

The maturity of our First Mortgage Bonds is predetermined and irrevocable.

Your investment will not be disturbed.

SCOTTEN-DILLON STOCK DIVIDEND

Clark, Emmons, Bryant & Klein & Brown, attorneys for the Scotten-Dillon Company, have advised the Detroit Stock Exchange that stockholders at the annual meeting January 25 probably will authorize a stock dividend, as of December 31, 1920. Persons who purchase stock since December 31 are advised to obtain from the seller a special authority directed to the company directing it to issue such stock dividends, if any, to such purchasers.

A Word to Michigan Corporations

THE financial editor of this publication will appreciate your sending in copies of your annual report to stockholders, balance sheets, earnings statements and lists of officers and directors, or any of such information as you wish published. This is especially desired of corporations whose fiscal year ended December 31, 1920.

Who's Who In Michigan Finance

Frank W. Merrick, Commissioner Michigan State Banking Department

Frank W. Merrick was born np in the Thumb country of Michigan in 1872, the son of a farmer. His father came to Huron county in 1867 and in 1869 engaged in the manufacture and sale of boots and shoes at Port Austin, which business was continued until 1875. In the fall of 1874 he was elected sheriff of Huron county and re-elected in 1882. In 1884 he was elected judge of probate. Strangely enough, the father was a staunch democrat, and the goodly majorities he received in the elections are abundant evidence of the esteem which the people of Huron county had for W. H. Merrick.

FRANK W. MERRICK

Mr. and Mrs. W. H. Merrick were plain people of very limited means and are remembered by the old residents of Bad Axe as wonderfully fine characters. Frank Merrick was obliged to go to work while very young, and from 1882 to 1894 he worked as clerk in the Bad Axe stores. On account of having to work from the age of 10, his opportunities for education were limited; nevertheless he became a good penman and obtained a fair education. His conscientiousness, coupled with the forcefulness which has ever since been his most conspicuous trait of character, attracted Frank W. Hubbard, who took him into the Hubbard bank in 1894 as a clerk. From 1894 to 1907 he was employed by the Hubbard banks in various capacities, spending part of the time in Pinconning as cashier and also looking after the Hubbard banks at other points in Michigan. In so doing he obtained a wide range of experience and a splendid knowledge of Michigan.

In 1907 he established the Farmers Bank of Pigeon, which later became the Pigeon State Bank. His record as a banker is enviable. On one occasion a local implement dealer questioned the correctness of a series of dealings extending over a period of years and when the issue came to trial the records kept by Mr. Merrick of the entire transaction were so complete and minute and so completely disproved the allegations of the complainant that the case was thrown out of court. The dealer attempted at two later times to bring action on his claim, until three attorneys had successively given up the fight and the three actions had been successively thrown out of court. This attribute of conscientiousness and the methodical carefulness with which Mr. Merrick managed his bank gained him early in his business career the confidence and respect of the community and when Governor Sleeper was casting around for a banking commissioner in 1915 his choice fell on Merrick. He has served his first term of four years as commissioner and was reappointed in 1919 by Governor Sleeper for a second term, which will expire in 1923.

There have been those who have disagreed with Mr. Merrick, but few who have not benefited by the close attention he has given the affairs of the banking department the last five years. The cumulative benefit of the comprehensive supervisory methods he has installed will be felt for a long time to come. The Michigan department stands high in the realm of bank supervising circles, as is evidenced by

Purchasing Agent as Assistant

Young executive experienced in buying general office supplies and appliances, also specializing in purchasing iron and steel and mill supplies for high grade manufacturing concern, wishes to connect with a progressive manufacturer or company. Member of N. A. P. A. Services available after Feb. 1st, 1921. Moderate salary to start. Box Y, Michigan Manufacturer & Financial Record, 611 Free Press Bldg., Detroit, Mich.

Factory Building For Rent

7,000 square feet, ground floor, with power boiler. Corner location, in Detroit east side. Apply Mr. Sink,
People's Outfitting Co.
Detroit, Mich.

Digitized by Google

the fact that Mr. Merrick has twice been elected president of the National Association of State Supervisors. He is not a seeker of publicity; never has been, and doubtless never will be, for the results of his endeavors have spoken with more effect than those of a press agent. Many have been the occasions where prompt action and accurate judgment have been required, and it is the testimony of many who have been closely associated with Merrick that he is not easily taken off his guard. He is quick to size up a situation, but deliberate, and once his mind is set on a course of action it takes the most convincing evidence to change him.

Mr. Merrick now lives in Lansing, having moved his family there from Pigeon in the fall of 1919. There are two young Merricks growing up who are sure to give good accounts of themselves to the coming generation of business men.

New Bank Building Manager Appointed

Burton Newcomb, for seven years engaged in managing business properties on the Pacific Coast, has been engaged by the First and Old Detroit National Bank and Central Savings Bank to become rental and operating manager of their twenty-four story bank and office building, under construction at Cadillac Square and Woodward avenue, the foundation work of which has just been completed.

BURTON NEWCOMB

In retaining a professional manager at this time, before the building is above ground and more than one year before its completion, the bank is following the practice recognized as necessary in large enterprises of this character in order that the construction, arrangement and general equipment of the building may best serve the requirements of a renting clientele and be put on a satisfactory basis as a revenue producer.

Mr. Newcomb has been engaged for several weeks in going over plans, specifications, business policies, etc., with this end in view, and will be retained in an advisory way up to the time the building is completed and ready for occupancy, when he will assume active management of the property. Mr. Newcomb will bring to bear in his new connection a business experience covering a period of more than twenty years in New York, St. Louis, New Orleans, Houston, Omaha, and more recently San Francisco and Los Angeles.

AUTO SCHOOL DISTRIBUTION

Of the 72 employes of the Michigan State Auto School, Detroit, 28 have been with the institution more than a year and are participants in the dividend distribution of $3,500 as a New Year's reward for their united effort. Of these, 16 have been with the school more than two years, and half of these nearly five years. It is the regular policy of the school, A. G. Zeller, president, announces, to distribute a similar bonus every six months to employees who have been with the company a year or more.

DETECTIVE ORDINANCE BLOCKED

Federal Judge A. J. Tuttle's temporary injunction restraining the enforcement of the Detroit detective ordinance adopted at the November 2 election will stand until the constitutionality of the measure is tested. It is declared confiscatory by opponents.

Hanna Furnace Co. Stock Listed on Detroit 'Change

The Detroit Stock Exchange announces the listing of the common and preferred stocks of the Hanna Furnace Company. This corporation is a recent consolidation of the Detroit Iron & Steel Company, United Iron & Steel Company, Penn Iron & Coal Company and Hollister Mining Company.

The Hanna corporation's balance sheet as of November 1, 1920, shows assets of $23,706,358.28. The preferred stock is cumulative, bears 8 per cent interest and amounts to $750,000. There are outstanding 189,500 shares of common of the par value of $10.

The Detroit Iron & Steel Company, which before the consolidation was separately listed on the Detroit Stock Exchange, operates two blast furnaces having a combined daily capacity of 685 tons of pig iron. The United Iron & Steel Company operates furnaces at West Middlesex, Pa., and Leetonia, Ohio. These furnaces with their complete equipment have a capacity of 735 tons of pig iron a day. The United Company also owns 204 beehive coke ovens at Leetonia, with 523 acres of coal adjoining the company's plant and a fully equipped mine with an annual capacity of 150 tons. The Penn Iron & Coal Company owns one blast furnace at Dover, Ohio, having a daily capacity of 450 tons of pig iron. The company also owns a modern by-product coke plant having a daily capacity of 350 tons of coke. The Hollister Mining Company has two thoroughly equipped operating mines capable of producing over 500,000 tons of ore a year and undeveloped reserves all under lease on a royalty basis located on the Menominee range near Crystal Falls, Mich.

A Convenient Record Book for Investments

Good business demands a systematic record of your investment holdings. Federal Income Tax requirements make it imperative

HALSEY, STUART & CO.'S "Loose Leaf Security Record" meets this need exactly. Thru its use, investors have always at hand complete information regarding their holdings—their amount of maturity, interest payment dates, prices paid, taxable status, etc.

The Record book is compact, practical and capable of expansion with the accumulation of your holdings. Included in its contents is a bond interest table, also a chart giving information regarding all issues of Liberty and Victory Bonds.

A copy of this Security Record will be sent without charge upon request for Booklet PG-7

Highways—Where and How

(*Continued from Page* 10)

granted a year's leave of absence to serve as director of the work to be done by the new Federal Highway and Highway Transportation Committee, and with Pyke Johnson, highway representative of the National Automobile Chamber of Commerce.

Prof. Tilden is one of the best known engineering educators in the country. He was called some time ago from Johns Hopkins to Yale to undertake a reorganization of the engineering courses. At one time he was a professor at the University of Michigan. Pyke Johnson is an well known in automotive circles as Prof. Tilden is in engineering education.

Prof. Tilden and Mr. Johnson visited Detroit last week for a conference with Roy D. Chapin, president of the Hudson Motor Car Company, relative to the forthcoming conference on highway and motor transport problems at University of Michigan, February 23. This and similar conferences to be held at all the universities and technical schools where engineering is taught, are fostered by the federal committee previously mentioned, and are part of a definite program of highway development to be undertaken, the nature of which will be discussed in a series of articles in this paper, of which this is the first.

Two Things Necessary

The writer asked Prof. Tilden and Mr. Johnson to tell him just what might be expected from the Government in highway development in the next few years, and what he learned will be most encouraging to manufacturers, dealers and users engaged in the automotive business, and to those men who are waiting for the opportunity to establish the motor vehicle upon a transportation basis.

"Two pressing needs in highway transport facing this nation today are legislation for the present requirements and education and research for future needs," said Prof. Tilden. "We need legislation such as the Townsend bill would provide—legislation establishing a Federal Highway Commission of five men selected by the President with the approval of the Senate. It may be possible that such a commission would eventually be included in a federal Department of Public Works, should such a department be established. However, it may be two years or more before the Government has such a department. The Reavis resolution provides for a reorganization of the government departments, but the investigation preliminary to any recommendations concerning this reorganization will take at least two years, and highway development cannot wait that long.

"We must have a budget for highway work prepared for 1922 and 1923, and considerable work must be done during the next year. The urgent needs in road work would be best met by the establishment of a Federal Highway Commission to begin laying out a system of trunk roads in co-operation with the states. This commission could take over the personnel and work of the present Bureau of Public Roads of the Department of Agriculture."

Mr. Johnson remarked that there would be opposition to a Federal Highway Commission on the ground that it would result in the organization of a new political machine of dangerous dimensions.

"This we do not want," Mr. Johnson said. "For that reason we believe that existing agencies in highway construction should be utilized where efficient. State highway organizations should be used as well as the present force of 900 or more good road men now working from the Bureau of Public Works. The real work of a Federal Highway Commission would be to co-ordinate the road work throughout the country and eliminate the expense that results from duplication, unavoidable under the present system.

"At present if a state wants federal aid for a piece of work, the government engineers inspect the road in question and the state engineers also make inspections and reports, an unnecessary duplication of work which could be eliminated by having the strictly national roads laid out by the federal commission, and the work done by state and federal units operating under the federal commission's supervision."

Where Research Comes In

Prof. Tilden called attention to another weakness in the present system, notably the construction by the Government of highways having no primary importance or value.

"The need of commercial highways in this country," he said, "is too great to waste time building second or third class roads traversing small sections of the country, but having no connection with roads of primary importance. This type of road building may serve a political purpose, and probably at some future time might be connected with a trunk highway, but it does not meet the real national problem.

"And this problem introduces the subjects of research and education. The first task of a Federal Highway Commission would be to make a survey of the whole country to ascertain where the primary trunk roads should be

Digitized by Google

located, the most comprehensive routes to be covered, with the thought of economy always in mind. It is one thing to determine where a trunk highway can be laid out with the greatest degree of accessibility to the largest territory, but it is quite another problem to apply the acid test of economy to location desirability.

"It will often be found that while the locations and routes suggested are admirable as to accessibility and comprehensive service, the engineering problems involved and resulting from the topographical nature of the territory prohibit economical construction. The fact of the matter is that we do not know much about building roads. This is an odd statement to make and probably will invite debate. It is the point where education enters.

"The United States government has a billion dollars to spend for road construction, yet A. T. Goldbeck, engineer in charge of tests in the Bureau of Public Works, says there is not an engineer in the country who can lay down a rational plan of design for highways to meet the new traffic conditions.

More Road Engineers Wanted

"Up to five years ago engineers showed marked ability in building roads. No one can reasonably criticise the highway construction of the years prior to 1915. They served the purposes for which they were intended; but what was good, sound construction then has no weight today. We are facing a new traffic problem of motor transport. Roads built for light passenger vehicles will not sustain the heavy duty freight truck. They even suffer from the heavy volume of passenger car travel. And before we can meet this new condition efficiently we must train a new school of engineers. Men trained as railroad engineers cannot build roads. This country needs today more road engineers than all the colleges and technical schools in the country can graduate in five years.

"Thirty and forty years ago the railroads absorbed the output of engineers. Then the problem of railroad building was new and there was a great amount of this kind of construction work to be done. Railroad building today is infinitesimal, yet railroad engineering is still the basis for such highway engineering instruction as is offered. Because so many graduate engineers never engage in the profession it is necessary to train 5,000 students in engineering to get 1,000 engineers who will follow the profession as a life work.

"If we could proceed with highway building with the prodigality of the Romans or the indifference to cost and conditions of military engineers in time of war, the task would not be so difficult. We cannot lay six-foot foundations as the Romans did, nor recruit an army at $30 a month per man as the War Department did in the World War. I am confident we can build 20-foot roads to withstand all that modern traffic implies and build them economically when once we get started.

"Our first efforts must be directed at establishing a standard curriculu on highway construction for the universities and technical schools of the country. Under road structure alone there are 100 problems to be distributed to colleges and technical schools. Modern road building involves economics, under which heading we have comparative costs of highway and other forms of transportation, the relation of highway costs to highway use, traffic sensing, number, type, percentage of types of vehicles now using the roads, and the tonnage problem.

Motor the Chief Medium

"Highway transportation must consider highway transport mediums, and motor transport is the chief medium to be considered. If we are to move 20 tons on wheels over highways, we must know all about the vehicle before we can

(*Continued from Page* 33)

thoroughly understand what kind of a road to build for it.

"Under the head of physical engineering we have surfaces, road structures to fit the needs of traffic, and location factors. The subject of public policy is all important. Our instruction in safety is a part of this problem, but only the beginning. We must have definite standards by which to determine administration, financing and regulation. The subject of maintenance is important. Not until just before the war did this country have any definite program of maintenance, because we were never able to get the money. It must be apparent to anyone who studies these problems that there is an urgent need of a storehouse of scientific data which will serve as a source for a textbook on highway transport similar in character to Wellington's 'Economic Theory of the Location of Railways.'

"With the proper support of the Government through legislation, the aid of the educational institutions in providing adequate highway transport and highway engineering education, and the thorough understanding of the public as to what its highway needs are, we will eventually be able definitely to prove the truth of President-elect Harding's statement that:

"'Transportation has made every avenue of civilization. It is the one agency for putting every community in the republic on the way to commercial progress.'"

Getting the Power to the Machine

(*Continued from Page* 8)

again at the other side, being thus crossed over. It is evident that a rope threaded on this drive would, after running a few minutes, have distributed the tension equally to all strands and that the tension would remain so in spite of variation in load or speed. This single-groove pulley must necessarily be of large enough diameter to extend from the top of the sheave at the one side to the bottom of the sheave at the other. This pulley is enclosed in a sliding framework to which is attached a cable which suspends (over a pulley) a 1,700-pound weight, thus keeping the driving rope at the proper tension, which tension can be varied by increasing or decreasing the weight. This system of tightening the rope is the most common where the American system of rope driving is used. One of the chief disadvantages of the English method is that a complicated system of tighteners has to be used or the ropes have to be spliced, and inasmuch as ropes stretch with continued use, this becomes a serious fault.

The advantage claimed for the English system is that if one rope breaks the others will carry the load; while if the rope breaks on the American drive, the unit it is driving is down and out until repaired. One of the advantages of the rope drive is that a higher speed is possible than with the belt. Probably the fastest rope drive in American is one in Cleveland, where 19 two-inch ropes travel 7,800 feet a minute over a driving sheave 14 feet 4 inches in diameter, transmitting approximately 1,400 horsepower. The longest known life of a rope drive is in England, in a Lancashire cotton mill. This was installed in September, 1878, and is still doing satisfactory duty, delivering 820 horsepower at about 4,400 feet travel a minute. It is not unusual to find cotton ropes doing duty for 20 years and over.

The Silent Chain

The silent chain has gained favor rapidly in the last few years as a medium for power transmission. The construction is simple, consisting of stamped links of steel pivoted together into a multiple chain. Besides permitting high speeds without excessive noises, silent chains are not affected by heat or dampness. The greatest advantage of the silent chain lies in the fact that the drive is positive, no slippage being possible as with a belt, and that the chain can be run slack on a short drive, which is practically impossible with a belt. It can also be run at high speeds without the disagreeable noises attending gear drives using the ordinary sprocket chain.

The Link-Belt Silent Chain consists of a series of leaves or plates, the joints of which consist of segmental case-hardened bushings and case-hardened steel pins. This construction limits the natural wear on the pin and the inside surface of the bushings. The gear wheels are designed for this purpose and the teeth carefully cut by an accurately generated cutter. The larger gears are usually made of cast iron and the pinions of steel.

The Morse Silent Chain also consists of a series of heat-treated steel leaves or plates, but the connection between the links consists of two pins, one of which is called the seat pin, and the other the rocker. Each is held securely in its respective end of the link, thus eliminating motion at this point. The seat pin has a plane surface against which the edge of the rocker pin rolls or rocks as the chain engages or leaves the gear. This rocking bearing, operating as it does on a sliding friction principle, makes joint wear to a minimum. The operation of the chain on the gear is similar in both instances, the shape of the link being such as to spread the load pressure over a number of the gear teeth, thus dividing the strain and wear.

The co-efficient of friction of various kinds of belts depends very largely on the kind of pulley with which the belt is operating. The original pulley was, of course, a wooden one, and wood pulleys are preferred today by many users. In fact there are more wood pulleys in use today than any other kind. This type usually costs less than the iron or steel pulley, and will stand rough handling and hard work. Iron pulleys are preferred by many, on the ground that an iron pulley will wear much longer than a wooden one, due to its more solid construction and greater tensile strength.

The relative friction value of leather on wood is so much greater than that of leather on iron that a certain pulley manufacturer has produced a pulley which is intended to combine the strength and safety of the iron pulley with the pulling power of the wood pulley. The hub and arms are of solid cast iron, machined so that the weight is equally distributed, and the inner rim, which is also of cast iron, is bored and turned and otherwise finished all over before it is bolted upon the iron center. Over this is laid a wood rim composed of hard maple segments, properly laid up in glue, with "breaking joints" in the several courses, and dried under heavy pressure to insure good gluing. It is claimed that a pulley of this construction can be operated at the highest rim speeds known in commercial practice, will carry the heaviest loads that a leather belt can put upon it, will withstand shock loads, operate without vibration and combine the strength of the iron pulley with the tractive pull of the wooden one. And the extra traction is worth considering. Assuming that 50 per cent of the circumference of the pulley is embraced by the belt, following are the relative values of leather belt operating on wooden and iron pulleys as given by two acknowledged authorities:

	Wood	Iron

Pulleys of Paper and Leather

The steel pulley has been coming to the fore in the last few years, due to its strength for the weight involved. The steel pulleys of a few years ago were badly formed, did not run true on the shaft and were easily damaged. The steel pulley of today, however, is well constructed, the hub is pressed true with the rim, cast hushings are used, and the edges of the rim are faced true with the bore. Another pulley which has been gaining in popularity for certain uses is the paper pulley. The co-efficient of friction of paper pulleys is very high, which is a necessary quality where power is to be transmitted from motors to lineshafts. An electric motor runs at a very high rate of speed; therefore the driving pulley must necessarily be small, and a small pulley, of course, presents a very small amount of surface to the

Center—Chapman Ball Bearing.
Bottom—S. K. F. Ball Bearing Hanger With Cap Removed.

Digitized by Google

belt. There being no shrinkage strains in a paper pulley as there are likely to be in cast iron, nor numerous pieces as there are in wood pulleys, it may be run at a high rate of speed with safety. Paper pulleys are about one-half lighter than cast iron pulleys, are not easily damaged and are practically non-breakable. Paper being a non-magnetic material, it is not subject to the attraction of motor or dynamo fields, thereby relieving the armature shafts and collars of end strains.

Another pulley which is very good for the same purpose and for the same reasons is the leather pulley. As the friction of leather on leather is five times that of leather on iron, the efficiency of the leather pulley is evident.

Some engineers claim that under the influence of the heat which is produced by friction, the tannic and sebacic acids contained in the leather of the belts unite chemically with a certain amount of the iron in an iron pulley and form a hard compound in the belt which rots the leather. This of course is avoided by the use of the leather pulley. A leather or paper pulley will admit of running the belt looser, also, thus relieving the strain on the belt and saving the bearings on the motor, machine or lineshaft.

Bearings

The subject of bearings is receiving a greater amount of attention in the last few years than it used to. Up to very recent years, a plain cast iron bearing or, at most, one lined with babbitt was good enough for the line and countershafts. Very recently however, mechanical engineers and factory owners have become aware of the fact that the friction generated in the lineshaft journals is felt in the coal pile or at the watt-meter. The result is that some very good ball and roller bearings have appeared on the market, and the results which have been obtained have been surprising. Ball bearings offer the least friction resistence of any known type of bearing. In the Chapman ball bearing a double row of balls approximately one-third the diameter of the shaft is used. These are of chrome alloy steel, accurately ground to .0001 of an inch. The raceways are made of a special grade of steel heat adapted to this purpose, carefully heat-treated, ground and polished. A substantial two-piece pressed steel cage, electrically welded, acts as a separator between the balls. The general design is such that while the load is distributed over the whole bearing, each row of balls is a unit in itself.

The S. K. F. ball bearing has the inner surface of the outer race of the bearing ground in the form of a sphere whose center is at the center of rotation of the bearing. The inner ball race, together with the double row of balls, is free to rotate within this spherical surface at any angle, which makes the bearing self-aligning. The inner race tilts with the shaft. The bearings are gripped on the shaft by means of a tapered sleeve between the inner ball race and the shaft, this split sleeve being drawn up and held securely in position by a locknut and set screw. Shafts in cast iron, babbitt or bronze bearings frequently become set if the shafting equipment is idle for any length of time. The oil is pressed out of the bearings and the rubbing of metal to metal generates friction which requires an abnormal amount of power to overcome. A ball bearing does not depend upon a film of oil to support the load; consequently this difficulty is eliminated.

Roller bearings are preferred by some engineers, on the ground that the roller bearing has a longer bearing surface and should therefore wear longer. A common example of this type of bearing is the Hyatt, which has a bearing surface composed of hollow, cylindrical rollers, each being wound from flat strip steel into a closed helical coil. Thus they are flexible and can adapt themselves to slight in-

regularities in either journal or box without causing excessive pressure. The cylindrical hollows in the rollers serve as storage space for lubricant and the helical interstices distribute the oil the entire length of the box. Half of the rollers have a left-hand helix and the other half, right-hand. The shafting bearing is of the standard type with a horizontally split box so that it can be put on a shaft anywhere and does not have to be slipped on over the end. The box contains linings of hardest steel against which the pressure is received, and an oil wiper is provided in each end to prevent leakage of oil. A test made comparing Hyatt standard lineshaft bearings with babbitted bearings showed a saving for the roller bearings of 64.9 per cent. The test was made with a shaft 2 15-16 inches in diameter, and 152 feet long, supported by 20 hangers.

BERKEY & GAY'S MELTING POT

Twenty-one nationalities are represented among the workers of the Berkey & Gay Furniture Company, Grand Rapids, which is one of the largest concerns in this line in the country. A chart compiled during November shows the following percentages as to the nationalities: American, 47.87 per cent; Polish, 15.52; Dutch, 14.20; German, 6.88; Russian, 3.38; Lithuanian, 2.63; Swedish, 2.48; Austrian, 1.90; English, 1.61; Canadian, 1.46; Irish, .58; Italian, .58; French, .43; Syrian, .43; Bohemian, .28; Norwegian, .28; Scotch, .28; Roumanian, .28; Danish, .16; Armenian, .16; Turkish, .16.

A Clean Floor Board

This little lever moved by the thumb selects the speeds.

The appearance of any car is enhanced by taking out all the trappings sticking out of the floor board. In closed cars this appearance is a decided advantage.

In an open car where a lap robe may be used, there is a further advantage of getting rid of the "Wobbiestick" hand gear shift lever and the emergency brake lever.

This can be done by removing the hand gear shift lever and placing the emergency lever to the left of the steering wheel. The C-H Magnetic Gear Shift eliminates the hand lever.

The clear floor board, free from levers and other trappings, is well worth considering when designing or purchasing a car.

Rumor Mongers Make All the Funeral Arrangements For Michigan's Retail Motor Vehicle Business; Now It's Found Patient's Condition Is Not Half So Bad

By F. W. HERSEY

AFTER GATHERING a fine collection of ill-sounding rumors relative to the various kinds and depths of ditches into which the retail motor car business in Detroit and Michigan was said to have skidded as a result of the temporary paralysis of the buying public's first finger and thumb, I decided to make a pilgrimage into gasoline alley and view the wreckage.

One beautiful thing about rumor is its self-propelling character. When the observant Chinese shirt polisher remarked laconically: "No pushee, no pullee, hut goee like hellee," he was talking as much about rumor as trolley cars or automobiles. Rumor travels on a thousand wings and enters wherever a door or window is left open.

I gathered from the general parade of whisperings that the retail motor car business had been laid out with candles and was only waiting for the tenor soloist to sing "Flee as a Bird," after which the death march and then the grave.

Grossly Exaggerated!

Another report was that the cause of death was a complication of diseases, one of which was acute indigestion induced by the attempt of the trade to swallow and digest several thousand motor cars sold on time contracts, but thrown back upon the trade because the buyers could no longer keep up payments. I was led to believe that in every salesroom the few salesmen who were left moved about on traveling cranes because the floors were packed so closely with new and old cars, which could never be sold.

I felt that, in setting out on my sad journey, I should wear crepe on my hat and prepare a neat little speech of condolence well-seasoned with expressions of appreciation for the many good qualities of the deceased. I decided that if the motor car business proved to be the charnal house it was depicted by rumor, I should return to the office and write a little something about death having no sting and the joys of the future life where motor car dealers and salesmen had gone.

About the last hours and final dissolution of the business I decided to say nothing, as the less said, the sooner mended.

Ah, but what a great and glorious feeling comes over you when you find the reported death of a friend or relative has been grossly exaggerated!

Not only has the death, hnt even the severity of the illness of the automobile business been grossly exaggerated. There is no use denying it has been sick, hnt the cause was dilitation of the heart. For months the dealers had been signing contracts, counting money and performing the other tasks incident to selling motor cars, at such speed that their pumping systems broke down. Then the buying public suffered a stroke of paralysis of the digits and old Doctor Economics ordered a rest and diet.

I am here to opine that the quick recovery made by the patient is worthy of a long article in the medical journals. The business has had rest and quiet enough. It is showing a restless disposition. I have done considerable pulse feeling along the line on my own hook and am satisfied with results. I stood outside of one of the Detroit's splendid sales and service buildings dedicated to the motor car business and wondered if it conid be possihie that a business which justified such magnificence conid possibly die.

I refused to concede such to be possible, and I find that the trade takes the same view. Gradually, hnt as surely as the tides ebh and flow, the motor car retail business has emerged from the slough of despond to the higher, firmer ground of cheerful optimism. The "rue" has been written into "rumor."

"Business for 1921? Why certainly, if you go after it. We have passed that period when the order taker, masquerading as a salesman, could say crisply: 'You're next. Please don't crowd.'" That is the kind of talk I heard. Figuratively speaking, I removed the crepe from my hat and swallowed my speech. When dealer after dealer told me that his December business was better than that of November, and January had opened strong, i just reversed the order and said: "Sting, where is thy death?"

There is plenty of money in the public sock, in the era of extravagance the leaven of thrift was working. That tide of buying stubbornness, largely the result of unfounded fears and price resentment, has had its flow, and now the ebh has set in. Having displayed its rancor over real and fancied selling abuses, the public is recovering its good nature under the mellow influence of the January sales of commodities of lesser hulk and cost, and, having saved a dollar here and there, is beginning to feel affluent, and affluence suggests motor cars.

Even as early as this—only two weeks, let us say, after the peak of the consumers' strike was reached—improvement is being noted. To the observer who hasn't a nickel invested even in a tire pump, the cautious approach of Mr. and Mrs. Ultimate Buyer within the radius of fascination of the motor car is highly amusing. The new type of prospect is like a butterfly. He flutters about this and that mechanical flower from the automotive garden, and the salesman who catches him will be the boy who carries a net and isn't afraid to get a little dew on his feet. The bargain hunter who left the department store bruised, but happy, approaches the motor car counter with much the same 99-cents-marked-down-from-a-dollar viewpoint as he expressed in the department store.

It is a good sign and works both ways. It indicates a desire to hy a car. it indicates a return to a true conscionsness of values; and where, in the whole realm of commerce, can you get more value for a dollar than in the modern motor car?

Cheerful Angels-to-Be

For men who were supposed to be planning their own funerals, the dealers along automohile row were the most cheerful angels-elect i ever met.

"Are you downhearted?" I asked Sales Manager Mayhew, of Harvey G. Wilson's organization.

"I should say not," he replied. "We are putting 25 cars on the floor and are going to move into a larger place. Compared with what the husiness has experienced, these are quiet times, hnt there is business coming."

I asked him about the "throw-backs"—the cars purchased on terms and turned hack because of inahlity to meet the payments.

"There are bound to be cancellations," he said. "Undoubtedly there have been quite a few within the last two or three months, hut when compared with the enormous number of sales made on such contracts, the cancellations are a small item."

Pursuing this particular subject further, it must impress any thoughtful person that if the cancellations had been as great as rumor has tried to indicate, the retail motor car husiness conld not have weathered the storm as well as

Digitized by Google

it has. It is true that there is considerable unemployment, but the percentage of persons buying good cars on contracts, and who are out of work, cannot be so great, for the reason that such contracts would not have been made unless the certainty of steady income of fair size had been established.

One of rumor's pet reports is to the effect that a dealer handling a line has car had seven new cars sold on contract turned back to him. When the story was run down it turned out that the dealer had one car, and a used car at that, turned back.

From the Detroit factory branch of the Reo Motor Car Company I get the report that dealers from out in the state are asking for cars; that during the last two weeks the general sales situation has brightened up wonderfully. I was told that more persons have been looking at Reo models in the last fortnight than at any time in four months.

"Prospects are looking for good trades," the sales manager said, "and sales could have been made had we been willing to meet trade terms proposed."

"Trade terms proposed" suggests the thought that because of the low demand and the temper of the buying public, some prospects will seek advantages in car purchases which no dealer can make and remain in business. This desire to compel sacrifices on the part of the dealers has shown itself, but among those motor car men I visited I found a general understanding that most of the trades and contract relations would be exercised in the future.

That prospective purchasers with money available are holding off for hoped-for price reductions in cars within the next month or two, I was convinced after making the rounds of the trade. The sales manager at the Detroit branch of the Cadillac Motor Car Company mentioned it.

"There is plenty of evidence of business in the near future," he said. "Price reductions are looked for on the theory that the raw commodities are to be appreciably cut in price, there is no reason why the motor car should not be. Certainly we have reason to believe that there will be a shortage, which would preclude any possibility of reduction."

Some Signs of Revival

W. D. Block, Marmon and Lexington dealer, looks for a buying rush before March.

"I see signs of it now," he said. "For some time there has not been the least interest shown in motor cars by the general public. This apathy has changed within a month to a mild interest, and I believe that following the national shows business will pick up at a lively pace. There will have to be a fixed policy on payments and discount charges. I consider 40 per cent down, 50 per cent if possible, as the least a dealer can accept."

"I would rather work than talk," W. J. Doughty, Franklin dealer, said. "This is a situation which requires good, old-fashioned plugging. Heretofore we have been delivering cars. Now we must sell them. I have seen enough to convince me that there is no cause to worry about the future. I have added men to my service department and am ready for an active sales campaign."

"The voluntary appearance of prospective buyers in our salesrooms every day, I consider the very best evidence of a gradual return of business," said Manager Smith, of the sales department, Simons Sales Company, Overland and Willys-Knight distributor. "There is a desire to buy cars and no evidence of a lack of money. So far I have seen no evidence of dissatisfaction with existing prices, although the tendency is to drive as hard a bargain as possible where there is a used car to be traded in. During December our business showed an increase of 50 per cent over November, and it was surprising the number of buyers who paid 80 per cent of the purchase price where contract payments were desired. We face in this business the demand for a change in sales methods. We must study the needs of prospects, a sort of service which begins before a sale is effected. Organization also will have an important influence upon future sales, because the dependability of the car will be largely judged by the character of the organization handling it. With the proper organization and the right kind of salesmanship, no dealer need be fearful of the future."

The sales manager of the Packard branch in Detroit answered my question regarding business conditions by reporting five new cars and three used cars sold the previous week.

"While we will not have the wild scramble for cars experienced during 1919 and the early part of 1920, there is bound to be plenty of business," he said. "I am inclined to think the public is looking for lower prices, expectations being based upon price reductions in other lines. Once they are satisfied prices are firmly established, buying will begin."

Paige Has Unfilled Orders

Apparently the sales force of the Paige-Detroit Sales & Service Company has discovered the magic talisman that brings business, for the sales manager reported he had more unfilled orders for spring delivery, "three times over," than he had at this time last year.

"We have our new models, which undoubtedly helps a lot," he said, "but it is not all new models. We have improved our sales organization and have taken note of every stray bit of evidence leading to possible sales. People are not broke, but they have not entirely recovered from the suspicion that prices are too high. The salesman with a complete knowledge of the facts and the ability to explain them can make sales."

"I am not denying that business has been slow, nor that we cannot expect the volume we have enjoyed, but I do believe that there will be a demand for good cars at right prices large enough to create a shortage before 1921 is half over."

The general opinion on business at the Bemb-Robinson Company, Hudson and Essex dealer, was that the New York show would stimulate the trade everywhere, and with attention again focused upon the motor car as a result of the shows and the approach of spring, buyers who had been holding aloof for one reason or another would come into the market.

The Thompson Auto Company, Maxwell and Chalmers dealer, looks for a marked change in from 60 to 90 days, while the Miller-Judd Company, which sells the Liberty, reports a lively interest in the cars and a willingness to pay cash where a sale has the appearance of a real bargain.

Want the Trade to Sacrifice

"Between now and the middle of February," the sales manager of Baker-Fisk-Hugill Company, Dort dealer, said, "you will note a gradual increase in motor car sales. A lot of sure-fire prospects want to see the trade make some sacrifices. That is to be expected. They see prices tumbling on every hand, and while they have the money to buy cars, they are inclined to be thrifty. For us December was as good as any December in other years—which is saying something, because this is not the time of year when motor cars sell well, and if times were really as bad as pictured, December, this year, ought to have been a gloomy month. We need to improve our salesmanship to meet the new conditions, for we are in a sellers', not a buyers' market. Buying power and desire are both in evidence."

No gloom pervaded the atmosphere around Manager Comstock, of the Thomas J. Doyle sales organization, which handles the Dodge cars.

"Did a better business in December than in November; expect to do a better business in January than in December," he said. "After

(Continued on Page 34)

Straws

IN CONNECTION with the declaration of its usual quarterly prefarred dividend, the Westcott Motor Car Company, Springfield, O., announces that preparations are being made to operate the plant on a normal basis, beginning February 1.

• • •

The report comes from the Grant Motor Car Corporation, Cleveland, that production is being increased and that the outlook is much better than it was some weeks ago.

• • •

Beginning January 15, all departments of the Republic Rubber Company, Youngstown, O., will resume operation. The plant closed December 23 for the holiday period and for the purpose of taking inventory and making urgent repairs.

• • •

The plant of the Auto Body Company, Lansing, has reopened with 200 men and orders for 750 bodies from the Briscoe Motor Corporation, Jackson, for February delivery, and a release on an order from the Gardner Motor Company, St. Louis.

• • •

DETROIT and South Bend plants of the Studebaker Corporation resumed production January 10. The working schedule will be six days a week to accomplish 75 per cent normal production, the output to be worked up to 9,000 cars a month by July.

The Sparks-Withington Company, Jackson, has resumed operations with a small force, but for the time being production will be confined to stock replenishment. Extensions have been made to the plant, preparatory to the revival of normal activities.

• • •

The Buick factories, at Flint, have opened after a vacation of three weeks, during which inventory was taken. The units will be operated for the present on the part-time schedule placed in effect in December.

• • •

The Continental Motors Corporation is taking on a few men at a time at its Detroit plant, although no definite date for reopening has been set. It is reported that 75 men went to work Monday.

• • •

Between 1,500 and 2,000 men resumed work Monday morning of this week at Plant No. 3 of the Studebaker Corporation, Detroit.

• • •

THE Hupp Motor Car Corporation, Detroit, which has about 800 men at work, is increasing the force daily, it is reported. The same is true at the factories of the Packard Motor Car Company, Hudson Motor Car Company and Columbia Motors Company.

• • •

One hundred men, one-third of the normal force, went back to their benches Monday in the plant of the Studebaker Corporation of Canada, at Walkerville, after a shut-down which started December 24. Edward Mackie, superintendent of the factory, is quoted as saying that the entire force will be taken on next week.

• • •

After having been closed several weeks, the Acme motor truck plant, in Cadillac, resumed operations this week with 100 men, one-third the usual force.

• • •

Announcement is made by the Novo Engine Company, Lansing, that all departments of the plant will resume operations January 17.

Michigan Sweetens It

Something About the State's Place in Sugar Making; Process, Plant Facilities, Money Invested, Distribution

SUGAR MANUFACTURE IN THE FACTORY OF THE MOUNT CLEMENS SUGAR COMPANY

At the left is shown a set of evaporators. The syrup is boiled under a vacuum in each tank in turn. At the right are shown some of the centrifugal machines, where the moisture is literally spun out of the syrup, leaving the clean, white sugar in the machine.

By HOWARD CAMPBELL

SUCHROSE, or sugar, is found in a large variety of plants, but is so apt to be accompanied by the characteristic flavor of the plant or other carbohydrates, such as starch or glucose, that unless it appears in relatively large proportions and can be successfully freed from the taint, it does not pay commercially to extract it. For its supply of sugar the world is dependent largely today on sugar cane and the sugar beet.

Cane as a source of sugar was discovered many centuries before the Christian era, although European nations knew little of its use until the thirteenth and fourteenth centuries. Early in the nineteenth century the countries in southwestern Europe became engaged in warfare and a blockade was established which cut off their supply of cane sugar, forcing them to search for something to take its place. A German chemist turned their attention to the beet and a series of investigations followed which resulted finally in the development of the beet sugar industry. Investigation and development by German scientists placed Germany at the head of the sugar producing countries of the world, although in the last few years sugar manufacture has become an important industry in the United States.

Unlike the cane, the sugar beet reaches its highest development in a north temperate climate, such as exists in Michigan. The soil, temperature and moisture of this state are ideal for beet growing, which is evidenced by the fact that in 1919 there were 121,498 acres of sugar beets harvested in Michigan, yielding 1,108,908 tons, from which were produced 132,268 tons of sugar. This was 26 per cent of the nation's supply. Of the 16 states engaged in this industry, Colorado was the only one producing more sugar than Michigan.

The planting of sugar beet seed takes place in the month of May, a planter being used which drills four solid rows of seeds into the ground at each trip across the field. When the plants are about two inches high they are "thinned," this operation being the removal of all except one every six or eight inches. The beets are ready for harvesting about the middle of September, being gathered usually about the time the first frosts come. When suitable for harvesting, the beets are loosened from the ground by means of a puller, picked or "pulled" by hand, "topped," loaded into wagons and brought to the factory or transferred to railroad cars as the case may be. The operation of "topping" consists of removing the beet top, or leaves, with a heavy knife.

The beets are unloaded in the beet shed, where they are thrown into huge bins with sloping walls, at the bottom of which are flumes or sluices provided with board covers. These covers are made in short sections so that they can be easily removed as the beets are fed into the flume. The beets are conveyed into the plant by floating them in in the current of water which runs swiftly through the flume.

As the beets enter the factory they are caught up by a bucket conveyor and dumped into the washing tank, which holds approximately half a carload. Through the center of the tank is a shaft to which are attached a number of paddles which stir the beets as the shaft revolves, thus cleaning off practically all the dirt.

On reaching the outlet end of the washer, the beets are thrown on to a belt conveyor, which carries them along very slowly, so that all weeds, sticks and other refuse can be picked out. The belt spills the beets into the buckets of a flight conveyor, which carries them to the top floor, where they are dumped into a hopper through which they pour on to an automatic scale. When 1,000 pounds have been received on the scale, the bottom of the hopper closes automatically and the beets are dumped into the slicing machine. The scale registers every 1,000 pounds of beets, thus keeping a record of the amount sliced.

The construction of a "beet slicer" is based on the well-known design of a horizontally revolving cutter plate. The machine is approximately ten feet high and eight feet in diameter at the base, where the cutter plate is located. The blades, which are about six and a half inches long, are arranged about the edge of the cutter plate, and the hopper is so made that the beets fall on the knives, those at the bottom being held against the knives by the weight of the mass above. The cutter plate revolves at a rate of 45 revolutions a minute, slicing the beets into long, narrow, thin strips called by their French name, cossettes. The cossettes pass under the disc and are received in a round box from which they are pushed out through a spout on to an endless conveyor belt which carries them to the diffusion battery.

A diffusion cell resembles a tank, being approximately seven feet high and five feet in diameter, and holds three tons of cossettes. When ready for operation the cossettes are dumped or fed into the cell through a manhole in the top. The cell is filled up to about ten inches from the top, then warm water at about 140 degrees temperature is turned in until the

THIS is the third of the "Romance of Michigan Industry" series. The fourth, which will discuss the state's foundry enterprises, will be published next week.

Digitized by Google

cell is foil. This warm water extracts the juice containing the sugar from the cossettes by a process of "osmosis."

When two liquids which, when mixed, do not produce chemical change, are brought in contact and allowed to stand, they mix uniformly without the application of mechanical impulsion or chemical force. Such action is called diffusion. The same action takes place even when two liquids are separated by a membrane, which is simply a fine network of plant or animal tissues. Diffusion through a membrane is called "membrane diffusion," or osmosis. Membrane diffusion may be illustrated by a simple experiment. Fill a sack with a sugar solution and surround it with water in a vessel. After a time an interchange will take place between the solution within the sack and the water surrounding it, the sugar passing out of the sack as the water passes in. This is the action that takes place with each cossette, and as the cossettes are very thin, practically all of the juice is extracted from them in from six to eight minutes.

When this time is up the juice is drawn out of the cell through a calorisator, or heater, and into the next cell. The "battery," as it is called, contains 14 cells; therefore, it is obvious that as the juice circulates it increases in density. After it has passed through a number of cells, its density becomes the same as that of normal juice. At this point it is drawn off into the measuring tank, where a record is kept of the amount of juice obtained. From here it passes to the reserve tank.

The next process is that of carbonation. The sugar solution, known as the "diffusion juice," is almost as black as ink as it comes from the diffusion battery, and therefore must be clarified. This clarification takes place in a "carbonation tank," of which there are six.

A carbonation tank, or "carbonator," is about seven feet wide by fourteen feet high. In the bottom of the tank is a coil of steam pipes for heating the juice and a system of perforated pipes through which carbon dioxide gas is admitted at the proper time. The tank is filled about half full of juice and a certain amount of lime added. The lime sterilizes the juice, precipitating the impurities and killing all the germs which have been introduced from the soil, water, air and other agencies. Carbon dioxide gas is now admitted under pressure, which precipitates the lime, carrying with it the impurities that were in the juice. The juice has to be watched very closely and frequent tests made to determine the point at which the operation should be terminated, although the usual time is about 12 minutes.

Fertilizer a By-Product

When the juice leaves the first carbonation process it contains a certain amount of precipitate of calcium carbonate, which must be removed before it can be subjected to the second carbonation. Therefore, it has to pass through the filter press. A filter press is a series of cast iron plates containing a number of long slots, with corresponding frames. A double thickness of duck and burlap is stretched over these slots and the juice is forced through, leaving lime precipitates within the frame. As more juice is filtered, the lime collects until it has formed a cake, which is then removed and later is used for making fertilizer.

The filtered juice, which now is clear and slightly yellow, passes to the second carbonation, which is practically the same as the first, more lime and more carbon dioxide gas being added. The second carbonation not only reduces the alkalinity but improves the juice as in the first carbonation, though in a smaller degree. The tanks for the second carbonation are constructed exactly the same as those for the first. Here the juice is tested every few seconds until the alkalinity is down to the required point, then the gas-valve is closed and the steam turned on until the temperature of the juice is up to 100 degrees F., in order to break up acid calcium carbonate formations. When the carbonation and heating are completed, the juice is pumped to the second filter press. The second filtration process is the same as the first.

After the second filtration the juice is sent to the sulphuring tanks, through which it passes in a continuous stream. Instead of carbon dioxide gas, sulphur gas is used in this operation, a continuous flow of gas entering the tank and a continuous flow of juice passing through it. This sulphuring process not only further reduces the alkalinity of the juice but also has a decolorizing effect, precipitates such lime as was not precipitated by the carbon dioxide gas, facilitates the crystallization of sugar from the juice, removes a considerable quantity of nitrogen compounds, and the sugar obtained has a better keeping quality, due to the antiseptic property of sulphurous acid. The proper alkalinity of the juice after this third carbonation should be about 1-100 per cent. The alkalinity is regulated by the speed with which the juice is allowed to flow through the tank. The faster the juice flows, the higher the alkalinity, and vice versa. A small amount of soda is also added in this process, and the juice is heated again before passing to the third filter press. The filtration process is the same as before, and then the juice is pumped into the supply tank, from which it is drawn as required for the evaporation process.

There are four of these evaporators, through which the juice passes consecutively. This operation is necessary before the juice is boiled, because (1) the juice contains too large a quantity of water and requires too long a time for boiling down in a vacuum boiler; (2) the juice contains a considerable quantity of substances which separate from the solution when boiled down to a syrupy condition and should be removed by filtration before further concentration, as they would otherwise increase the ash content of white granulated sugar; (3) the alkalinity of the juice should be corrected to the proper degree, since too high alkalinity renders the crystallization of the juice difficult.

The juice enters the first evaporator under slight pressure and passes into a series of copper tubes, of which there are 1,100 in an evaporator. The juice in the first evaporator is boiled by steam from the boilers, but in the second evaporator it is boiled by the vapor from the juice in the first one, and each succeeding evaporator is boiled in the same manner—by the vapor from the preceding one. A steam of any temperature can evaporate a fluid whose boiling point is lower than the temperature of the steam. Steam developed by a certain temperature has the same temperature as that of the fluid from which it has been developed, so long as both remain under the same pressure; hence, in order to evaporate the juice in each tank with the vapor from the preceding tank, the pressure must be lowered. This is done with an air-pump, a vacuum being created in each tank, which, of course, lowers the pressure. A greater vacuum is created in each succeeding tank, thus making it possible for the juice to boil at a lower temperature in each tank in turn, becoming cooler and thicker as it passes toward the last tank. When it enters the evaporating process the syrup contains approximately 90 per cent water. It leaves the last evaporator in the form of a thick, transparent, yellow syrup con-

Tire Business Picking Up, Akron Executives Agree

Although the majority of the tire manufacturers have felt and are still feeling the effects of the slump in the automotive industry, reports from Akron and other tire centers indicate that a revival in the business is noticeable. Most of the leaders in the industry are confident that, just as in the case with the motor car makers, the turn of the road has been reached.

In a special telegram to the Cleveland Plain Dealer, its investigator in Akron quotes a number of men. H. H. Firestone, president of the Firestone Tire & Rubber Company, is credited with having said: "There never was a greater opportunity for sound business than at present, and there never were greater difficulties facing it. The present year is going to be a survival of the fittest in commercial and industrial fields. I believe the next twelve months will be a hard test of management and organization."

The Firestone, Goodrich, Miller and Goodyear concerns all reported substantial increases in sales. The opinion is widespread that there will be a shortage of tires before summer, the Goodyear people believing it will be felt in April or May.

The Wall Street Journal, which also made an investigation of conditions among the tire manufacturers, says in part:

"At the Miller Rubber Company, which is one of the four largest in the city, William Pfeiffer, secretary-treasurer, was reluctant to make predictions, but said that production must be resumed on a larger scale beginning with the new year because business will be coming back with a snap.

"W. O. Rutherford, sales manager of the B. F. Goodrich Company, warned against the spirit of optimism being carried too far at this time, just as the spirit of pessimism has been carried to an extreme. 'There is no way for business today to avoid the economic crisis through which we are passing,' said Mr. Rutherford, 'and therefore I would not like to be too much in a hurry in getting through the period of readjustment. Just as it is better for the patient when convalescing to lie in bed a few days longer, than to attempt to get up before he is sufficiently strong, so it is better that business be not over-hasty in trying to come back to its former swing. However, sales are picking up. There is no denying that. Better business will follow the present depression as surely as the day follows the night. The rubber business is on a sound basis and we are in a position to take advantage of the turn upward as soon as it has been determined that it is definitely with us.'

"H. B. Bixler, consulting engineer for smaller rubber companies and owner of an experimental laboratory where much of the testing is done for them, stated frankly that the smaller companies had more orders than they could take care of, provided they were certain of the credit standing of the prospective buyers. 'Practically every small concern with which we have dealings,' said Mr. Bixler, 'tells us that they have an enormous amount of business on their books but that they are afraid to ship the goods in many instances, because the old-time credit standings have been shaken by the present depression and it requires time to get back this kind of information upon which business is founded. The small rubber company which is in a position to take advantage of the present low market prices on rubber and fabric and also labor certainly is in the best position of its history to make money, and in many instances they are doing it.'"

ACCOUNTANTS IN LARGER QUARTERS

Control in Business

CONTROL is the brain of a business in action. It is the irresistible force which determines the value of success. Stability and progress depend upon it. As it is intelligent so it dominates. Organization, System, Method, are hopeless without it. And control is hopeless and worthless, unless founded on, and continually supported by, accurate and usable knowledge based on timely facts and figures.

If this is true, the importance of such knowledge *to the executive who would control* must be apparent. Absolute confidence in the character and source of the knowledge, in the ability of the men who secure it, and in the accuracy of their methods of assembling and co-ordinating it for his use, is imperative. Its fitness, its application to his needs—in factory or office, buying or selling, cost or maintenance—and the assurance that it is timely to the minute, are vital factors in making this knowledge his controlling force.

Freight Rates and Living Costs

Falling Prices Refute Claims of the Alarmists; What the Recent Advance Has Done for the Roads

By GEORGE DALLAS DIXON
Vice-President in Charge of Traffic, Pennsylvania Railroad

THE primary concern of business men in developments affecting the railroad situation lies in securing good service. The precise level at which freight rates may be fixed is a secondary matter, so long, of course, as they are within reasonable bounds and preserve fair relationships. This naturally results from the fact that the producers or merchandisers of articles and commodities quite properly regard transportation costs as an expense which must be included in the selling price charged the final consumer.

That is entirely fair, because the cost of transportation is just as much a part of the expense of getting goods into the consumers' hands as are the factory payroll, fuel bills, the outlay for raw materials, or the charges for the use of capital. Therefore those who condemn the producer for passing on to the consumer his transportation costs, or ridicule his reasons for so doing, are themselves in the wrong, because it is the soundest kind of economics that the consumer must pay the freight.

However, business men do want to know that the rates which must be paid are reasonable, that no one is profiteering on them, that they are not too high for the service rendered and that they are not a burden to the country.

When the Interstate Commerce Commission this summer announced the rate increases which, under the terms of the Transportation Act, it had decided upon as being necessary to put the railroads in self-sustaining condition, there was a flood of extravagant assertions concerning the effect which the advanced rates would have upon the cost of living.

Alarmist statements were circulated based upon the theory that transportation costs, generally speaking, enter not once, but several times into the final cost of a finished article. This theory, which, properly stated and intelligently grasped, is correct, was twisted by a perversion of logic and mathematics into the idea that the real amount paid by the people, by reason of the rate increases, would be four or five times the sum the Interstate Commerce Commission had intended to award. Put into figures, this was publicly interpreted as meaning that instead of giving the railroads a total rate increase of about a billion and a half dollars, the people would have to pay six or eight billions—indeed, even the sum of ten billions was named.

Absurd as such statements were, they received wide currency, as do most sensational utterances coming from apparently responsible sources. I regret to say that persons officially connected in several instances lent their names to this sort of exaggeration. The people were told, and probably many of them believed, that the cost of living would be increased, for the nation as a whole, by as much as ten billion dollars a year.

How far this was from the truth may best be gathered from the undeniable fact that ever since the rate increase was announced, prices have tended to decline the country over and are today, according to all visible indications, headed for generally lower and more nearly normal levels. Events which are actually occuring in the industrial and commodity markets are the strongest possible answer to the unsettling predictions made regarding the effect of the rate increase on the cost of living.

It is easy to show the fallacy of the arguments used. Suppose it is true that on the average transportation charges enter, let us say, four times into the cost of articles and commodities. This might be illustrated by a case in which three tons of raw materials are needed to turn out one ton of finished product. Freight would first be paid on the three tons of materials. Then it would be paid again to get the one ton of finished product into the consumer's hands. Thus, before the single ton of product could be delivered to the user, it would have had to bear the charges for the transportation of four tons. These accumulated charges would of necessity be incorporated into the price which the consumer would have to pay.

Whether that really represents an average state of affairs or not, I am sure I do not know, but if it does, the total freight charges which entered into the cost of the finished product, under the old rates, were a definitely ascertainable sum, consisting of the freight on the raw materials, plus the freight on the finished product. If, now, we increase all these rates by, say, 40 per cent, we only increase by 40 per cent the total freight charges that were paid before. We do not increase them by four times 40 per cent, or 160 per cent; and yet figures were so loosely handled by more than one so-called statistician as to create that impression.

To view it in another way, if all freight charges are raised enough to add a billion and a half dollars to the annual revenue of the railroads, there is no way by which the railroads can make the people pay each charge several times over and so turn the billion and a half dollars increase into one of six or eight or ten billions.

If there is profiteering by dealers on the rate increases, jumping up prices more than the advances in the rates warrant, that is a different matter. The proper course then would be to get after the profiteers, not to starve the railroads. As a matter of fact, I think the public were too generally put on their guard to permit profiteering on any considerable scale. Further, as I have already said, facts are the best answer, and prices and the cost of living are going down instead of up with the higher freight rates in effect.

Julius H. Parmelee, chief statistician of the Bureau of Railway Economics, has approached the subject from an interesting viewpoint, and his general conclusions are very instructive. He says:

"The percentage of all transportation costs to the general national income has been from 4 to 8 per cent. A 35 per cent increase in freight rates, which can be accepted as the general average of this increase, means an increase of 25 per cent on the 4 or 8 cents paid for transportation out of each $1 of retail value, or about 2½ cents on the whole.

"In other words, an article now retailing for $1 should not be increased more than 2½ cents in the future. I have talked, it must be understood, in terms of average, but I have tried to give as nearly as possible just what the freight rate increase should mean to the man who pays the bills, the ultimate consumer."

Two and one-half cents on the dollar is not much of an increase, even if prices on the average had risen as much, and it would be a small sacrifice to make for solvent railroads and the means of restoring good transportation. But anyway, as I pointed out, prices are not going up at all. They are going down under the influence of economic forces, compared with which the entire rate advance is a trifle.

Here is a fundamental and most important truth which should be clearly grasped. The people of the country as a whole must inevitably pay all the costs of the transportation service which they receive. It cannot be otherwise as long as the rules of arithmetic hold good and it continues to be impossible to make something out of nothing.

There are three ways in which the people can pay—in rates, in taxes, or in a combination of both. For several years the last named has been the method followed. All that has happened under the rate increases has been that the proportion of our national transportation costs heretofore paid in taxes has now been transferred to rates. Therefore really nothing occurred to increase the cost of living, because we were paying the full cost of living before, including our transportation bill, for a part of which latter we were taxed. Now we are going to pay the transportation bill in a slightly different way; or, if the figures seems more apt, our national bookkeeping has been reformed.

Having said what the new rates will not do —namely, increase living costs—let us consider what may be expected of them in an affirmative way.

A result which may reasonably be expected, and to which probably too little attention has been paid, will be to release the purchasing power of the railroads. Our own company, now that its earning status is fairly well settled and no longer a matter of guesswork, will probably be in a position to enter the equipment market, at least on a moderate scale, as soon as satisfactory prices can be obtained. General materials and supplies will also be bought a little more. Activities here of industry all around ought to be expected to follow such action on the part of our own and other railroad systems.

Second, the country is relieved of the menace of wholesale railroad bankruptcy. Had the rates not been raised, such an event could not have been averted, and the roads would have been thrown back into the hands of the

You will find **MILWAUKEE MILLING MACHINES.**

Positive alignment of the arbor is provided by the Double Overarm, which gives Milwaukee Milling Machines rigidity and accuracy. They efficiently handle all milling—light or heavy.

The automatic flooded lubrication system lubricates all bearings and gears in the column, feed box and pulley bracket. Each machine also possesses an automatic cutter lubricating system, which is furnished without additional expense. All levers and handles are conveniently located.

Cars Sell at New York Show

That's the Important Thing About the 1921 Exhibit; Display Most Attractive; Sober Atmosphere Noted

NEW YORK, January 11.—They are selling cars at the New York Automobile Show.

That is the big news that is being flashed from the metropolitan city to manufacturers, dealers, bankers and the business and industrial interests of the country in general. That is the good news that has been sent to the one city which is most interested—Detroit, the center of the automotive industry of the world.

And it is because cars are being sold—not by any means by the hundreds as yet, this being only the fourth day of the show—that everywhere activities in the automotive industry are resumed. As one of the leading parts makers told the writer today, the eyes of the entire automotive fraternity are turned toward New York. The captains of the industry are keeping in constant touch with what is going on—are eagerly awaiting reports from their representatives here; are beginning to map out their production schedules according to the developments at the Show.

There can be no question that if the news from this city were to the effect that no sales were being recorded, instead of putting on more men at some of the Detroit plants, or resuming activities this week, most of the plants would be closed down tight today. That was the statement made by a man connected with one of Detroit's industrial organizations, who added that probably more than half of the factories in Detroit and some other Michigan cities were depending upon the outcome of the automobile show—that some of them had already been advised to get going, while others are only waiting the word. While much has been said lately just to stimulate optimism, the situation has so changed that what is being said now may be taken in the majority of cases to be based upon facts, this man asserted.

There are two distinct divisions among those who are visiting this annual exposition at the Grand Central Palace. On one side may be placed the usual visitors—those just interested in the show as they are in many other events of the kind, some being prospects while others never will be. In the other division are to be found the manufacturers, the dealers, and in fact all those connected directly with the trade. Compared with former years, there are quite a few less of the plant officials this year. This is due to a great extent to present conditions, to the desire all around to cut down expenses. In Detroit the writer was told that this year many automobile men who never have missed the "big show" would not be present this year unless they paid their own way. They were privileged to go if they wished—at their own expense; but they are not going, at their own expense.

So that it may be said that this year the attendance from an industrial and business side is a more critical one and much less in the nature of a "honeymoon" trip, as some of the old-timers often described their annual sojourn to Madison Square Garden or the Grand Central Palace. This year it's a business proposition with all, and a joy ride with very few. And while there will be banquets and other entertainments, the opinion has been expressed that all will be in keeping with the present conditions—of a "sober" character. Business, and not pleasure, is the slogan in the industry for 1921.

This year's show is the finest in the history of the twenty-one which have been handled practically without exception by S. A. Miles, manager of the National Automobile Chamber of Commerce exhibits. Every well known car made in the country is on hand and the display from Michigan is naturally the largest. As usual there are new things, although not as numerous as some had expected. A more detailed review of the show from a technical point of view will appear in this publication subsequently, but it may be said that those who have taken in the annual events regularly find from their observations that the 1921 cars represent improvement in many ways.

There are now in New York quite a few of the experts in the European automobile industry who came to get first hand information as to the trend of our industry.

RAIL MEN TO HEAR GRAY

The speaker for the noon day luncheon of the Transportation Club of Detroit, at the Fellowcraft Athletic Club, January 22, will be William J. Gray, vice-president of the First & Old Detroit National Bank. Mr. Gray will discuss current business conditions.

Planning the Port of Detroit

Port Development Committee of Board of Commerce And City Plan Commission Meet to Compare Notes

WHILE no definite recommendations relative to future port development at Detroit, which is a serious problem in view of the probability of a St. Lawrence route to the ocean, were made, the conference between the Port Development Committee of the Detroit Board of Commerce, and the Detroit City Plan Commission, January 6, at the Board of Commerce, established a sound basis of co-operation between the two bodies.

William H. Adams, chairman of the development committee, opened the conference with a presentation of the committee's views and what the city's port facilities should be, and its desire from the co-operation of the Commission. Other speakers were Edmund T. Patterson, president of the Commission; W. E. Campbell, chairman of the Commission's sub-committee on port development work; T. Glenn Phillips, consultant and secretary of the Commission; E. M. Walker, member of the Commission, and W. B. Campbell, David Molitor and Charles H. Brodt, members of the port committee.

A study of the port development plan presented by the Commission to the city council revealed that its only definite recommendation was for a charter amendment to provide for a harbor commission and advisory board. A tentative recommendation suggests the establishment of a commercial port at Zug Island, where ocean vessels could unload and load without having to shift, while merchandise would be moved to points in the city and industrial district via river lighters, motor trucks and belt line railroads. It was proposed that the city water front be left to private interests for development as an industrial port, or for any other purpose that might prove desirable. It was felt that the port of Detroit should all be located below the city, in view of the fact that the drift of industry is toward the River Rouge district.

The tentative plan evolved by the Port Development Committee calls for the establishment of an industrial port in the River Rouge district and a commercial port along the city water front; also for a state law creating a Detroit River Harbor Commission, consisting of representatives of Detroit and towns along the river from Lake St. Clair to Lake Erie.

It is the opinion of the Commission that a state constitutional amendment will be necessary before a harbor commission such as advocated by the Port Development Committee can be created. As to the physical features of the harbor improvement plans, it was unanimously agreed that as such considerations are of minor importance so early in the campaign, no final and definite recommendations should be made by the Commission or any other civic body until after investigation and research has been made.

At the conclusion of the session it was the opinion that much light had been shed on the situation and new avenues of investigation opened. Members of both bodies felt that a basis of co-operation had been established and that hereafter the Board of Commerce committee and the commission could work in harmony in making Detroit one of the greatest ports in the world.

DOW ASKS TARIFF PROTECTION

The chlorine products industry must be given adequate protection through customs duties if it is to survive post-war German competition, James T. Pardee, of the Dow Chemical Company, Midland, testified last week before the House Ways and Means Committee. He urged an increase of 28 per cent over the rates provided by the Underwood tariff.

The Dow company, he said, was in the same position as hundreds of others in the chemical industry which expanded their business to take care of war needs and were now faced with European competition, with the added handicap of low labor costs abroad and the adverse money exchange rate.

Mr. Pardee advocated a specific duty of 7 cents a pound on bromines and bromides, plus a 30 per cent ad valorem duty. On chloroform he asked a like specific duty and an ad valorem rate of 33⅓ per cent. Carbon tetrachloride, he said, would be adequately protected by a 2½ cent specific duty and an ad valorem rate of 15 per cent.

JOSEPH H. HUNTER RECOVERING

Joseph H. Hunter, president of the Detroit Insulated Wire Company, has recovered sufficiently from a recent motor accident to be removed to his home, Pasadena apartments, 2170 Jefferson avenue, from Grace hospital.

BENTON HARBOR ACTIVITIES

The annual report of the Benton Harbor Chamber of Commerce reviews an active year and indicates much promise for the future. The Saranac Machine Company is located in its new plant. The Moulds Brass Foundry is building a new works, which will be completed soon. When the company moves from the Werkman factory building, the Baker-Vawter Company will occupy the entire floor space. The new headquarters of the American National Bank in the Hotel Benton Block will be ready for occupancy February 1. Year around transportation will be attempted by the Benton Transit Company, which has purchased the steamer Pilgrim to make weekly trips between Benton Harbor and Chicago all winter as well as in the summer.

PORTLAND CEMENT INTERESTS SOLD

The plants and business of the Burt Portland Cement Company, Bellevue; Ironton Portland Cement Company, Ironton, O., and LaSalle Cement Company, LaSalle, Ill., have been purchased by the Alpha Portland Cement Company, Easton, Pa., and C. A. Irvin has been elected vice-president of the Alpha company and given charge of the territory formerly covered by the other three companies. His office will be at 140 South Dearborn street, Chicago. Sales offices will be maintained at Bellevue, in charge of P. L. McClintic, and at Ironton, O., in charge of J. R. Paul.

ENGINEERS INSTALL OFFICERS

The Detroit chapter of the American Association of Engineers installed officers Monday evening in B. E. Taylor's auditorium, Wayne street and Congress street west. Clarence W. Hubbell, city engineer, became president of the chapter, other officials being L. N. Hayden, D. U. R. engineer, vice-president; H. Hudson, city engineer's office, vice-president; Eugene I. Van Antwerp, Grand Trunk Railroad, treasurer, and Wilbur M. Hankinson, Grand Trunk Railroad, secretary.

ROSS ENGINEERING EXPANDS

The J. J. Ross Engineering Company, 1066 Larned street east, Detroit, has enlarged its quarters to accommodate additional business. The company manufactures battery charging

Small Speed Truck Leads All Types in 1920 Output

Despite the depressed business conditions the latter part of 1920, the motor truck industry during the year exceeded its 1919 production by 43,000 vehicles, the total output being 148,000 vehicles. Small speed trucks of three-quarter to one-ton capacity represented 75 per cent of the production volume, an increase of 15 per cent over the ratio of small truck production in any past year. In reality it was small truck demand which held the production level and produced the excess.

According to an analysis made by the Commercial Vehicle, the average prices of all different sizes of trucks had increased only 8½ per cent up to January 1, 1921, as compared with January 1, 1920. Taking the different sizes of trucks separately, those of less than one-half ton capacity increased most in price. Trucks of less than one-half ton capacity jumped 25 per cent in price. Three-quarter tonners increased 19 per cent; one-tonners, 10½ per cent, and one and one-half tonners, 12.3 per cent. Trucks of from two tons capacity up increased individually anywhere from one-tenth of one per cent to 7.3—these low individual price increases helping to bring down the total average price to the figure of 8½ per cent, as given above.

According to the same authority, trucks of one and one-half ton capacity form the most popular model—no less than 100 models, or 20 per cent of the total number of 527 trucks listed on the 1921 market, being of one and one-half ton capacity. The next most popular model is the two and one-half tonner, with 90 models, followed by the three and one-half tonner with 84 models.

An analysis of the final drive situation as made by the Commercial Vehicle shows the predominance of the worm-driven rear axle when considered from both the viewpoints of trucks actually produced and the number of models offered for 1921. The 1921 production of trucks were fitted with the types of drive shown in the table below:

Type	Percentage
Worm	67
Bevel	15¾
Internal-gear	16
Double-reduction	4½
Chain	1¾

When the final drive situation is considered from the viewpoint of the number of different models offered for 1921 with each type of drive, the analysis gives the following percentages:

Type	Percentage
Worm	68¾
Internal-gear	21¾
Chain	4½
Bevel	3½
Double-reduction	2¾

Further analysis of the new trucks for 1921 indicates that pneumatic tires have now become standard equipment on trucks of one-ton capacity. Last year, trucks of this capacity were fitted with solids as standard equipment. The use of four-speed gearsets to produce trucks with greater speed ranges and a greater pulling power at low speeds has increased considerably; and four-speed gear boxes are now average standard equipment on all trucks of two-ton capacity and over.

The trend of design on other truck units shows an increased use of cast case radiators and tubular cores, as against sheet case radiators with cellular cores; dry disk clutches at the expense of other forms—amidships location of the gearset for easy repairs—vacuum fuel feed systems; and the use of metal instead of wood wheels, especially on the heavier models.

U. S. C. OF C. MEETS APRIL 27-9

Joseph H. Defrees, president of the Chamber of Commerce of the United States, announced this week that the ninth annual meeting of the National Chamber would be held at Atlantic City, April 27, 28 and 29.

Production :: Sales :: Service :: Financing :: Personnel

GOODRICH 50 YEARS OLD

The B. F. Goodrich Rubber Company, Akron, O., celebrated the fiftieth anniversary of its foundation, December 31. It was on that date in 1870 that the Goodrich corporation was organized by the late Dr. Benjamin Franklin Goodrich and 15 others, all Akron men. The latter put up $1,000 each and the company started with a capital of $15,000. When the little plant began operations there were not much more than a score of people employed. Today it is one of the largest rubber goods manufacturing concerns in the world, with business totaling more than $100,000,000 annually. Akron today produces close to 50 per cent of the world's total of rubber goods and two-thirds of all pneumatic automobile tires.

DUPLEX TRUCK RE-ELECTS LEE

Harry M. Lee again heads the Duplex Truck Company as president and general manager. All other directors were re-elected by the stockholders at the meeting last week. Reports showed the company sound as to surpins and assets.

NASH DEFENDS THE BANKS

Speaking before automobile dealers and bankers at a dinner at the Detroit Athletic Club, Detroit, last week, C. W. Nash, president of the Nash Motors Company, Kenosha, Wis., declared that the banks of the country had saved the motor car industry from serious financial troubles and were aiding it effectively during the period of readjustment. Mr. Nash predicted a steady volume of business in 1921.

MOTOR EXPORTS IN 1920

During the first 10 months of 1920 American manufacturers exported 112,376 passenger cars, compared with 67,145 in 1919 and 28,306 in 1914.

NATIONAL AUTO DEALERS' MEETING

The fourth annual convention of the National Automobile Dealers' Association will be held January 31 in Chicago. H. G. Moock is in charge of arrangements.

NEW APEX PLANT BEING HURRIED

Work is being rushed on the new plant of the Apex Motor Corporation, Ypsilanti. Rearrangement of the original factory building for quantity production has been completed. The Apex company was organized a year and a half ago for the purpose of manufacturing 300 Ace cars for one distributor, after the latter had tried out one of the machines. All of the cars since made by the company thus have gone to the Pacific Coast. Plans are now being perfected whereby the car will be marketed generally.

MASON TIRE'S 1920 SHOWING

Net profits of the Mason Tire & Rubber Company, Akron, for the 1920 fiscal year which ended October 31, totaled $527,669. Gross sales were $7,150,798 and gross profits $1,583,839. Total assets are placed at $5,224,060, while current assets show $3,460,548 and current liabilities $834,586. The company has an inventory of $2,625,213; cash of $114,149, and accounts receivable, $721,186. Dividends for the year amounted to $414,834.

NEW $50-POUND CAR PROMISED

A new automobile is to be manufactured by the Gray Light Car Corporation, a Colorado company with capital of $1,000,000, the plant being located at Longmont, near Denver. According to the announcement made by H. A. Gray, president and general manager, this new two-passenger vehicle will be the lightest automobile on the market, weighing 540 pounds without body and 850 with the body. The selling price is to be $450. The car will have a two-cylinder engine of 13 horsepower and which will run 50 miles on a gallon of gasoline, it is claimed. The gear mechanism and transmission are so designed, said Mr. Gray, that gear-stripping is impossible. On the strength of the showing made by the demonstrator, it is said that the company has booked orders for 2,500 cars. Production will begin as soon as the price of steel becomes stabilized. Besides Mr. Gray the other officers of the company are: H. M. Koutz, vice-president; E. J. Kiel, second vice-president; J. H. Vickery, secretary-treasurer; O. E. Cumston, manager. All of the officers are residents of Longmont.

BUICK'S ST. LOUIS OUTPUT

The Buick Motor Company's assembling plant in St. Louis, Mo., is reported to be assembling an average of 50 cars a day. This is one-fourth to one-fifth of the plant's capacity. As conditions warrant, there will be increases in output.

CHANDLER'S 1920 BUSINESS

It is expected that the final figures on the 1920 business of the Chandler Motor Car Company, Cleveland, will show that the year was the best in the company's history, say Cleveland daily papers. The total production probably will be between 24,000 and 26,000 cars, as compared with less than 20,000 in 1919. According to the Plain Dealer, the net profits will be better than $5,000,000, which would be equivalent to about $18 a share on the 280,000 shares of capital stock. The company has no bank loans and it is believed that the present $10 dividend rate can be maintained upon a turnover of only 40 per cent of this year's business.

ROLLS-ROYCE RESUMES

The American works of Rolls-Royce, Springfield, Mass., have been reopened, after a shutdown for inventory, with 600 men regularly employed, and additional workers. The first chassis is now being tested out.

NEW LANSING TRACTOR AGENCY

The Republic Motor Sales Company, Lansing, has taken the agency for the Cletrac tractor, made by the Cleveland Tractor Company, Cleveland, O., for the counties of Clinton, Ionia, Shiawassee, Eaton and Ingham.

N. S. BEEBE JOINS KELSEY

The Kelsey Motor Company, Newark, N. J., which will make the Kelsey friction-drive car, announces that N. S. Beebe has become associated with the company as a financial executive. Mr. Beebe is well known in banking quarters. He handled the financing of the Templar Motors Company, Cleveland, and more recently that of the Northway Motor Company, Boston.

AUTO BODY MEETING JANUARY 17

The annual meeting of the stockholders of the Auto Body Company will be held January 18, at the Lansing Chamber of Commerce. Following the election of directors and transaction of any other business, the meeting will be adjourned to January 27 to permit the completion of the inventories and the statement.

MILBURN PUTS 200 MEN TO WORK

About 200 men resumed work in the body epartment of the Milburn Wagon Company, oledo, January 3, when this part of the Mil- urn plant re-opened after having been closed everal weeks. It is said that the force will e gradually increased and that officials be- lieve the crisis in the automotive industry s about over.

FEDERAL TRUCK ANNUAL MEETING

The annual meeting of the Federal Motor ruck Company, Detroit, will be held February , 1921, at 2 p. m., at the offices of the company. tock transfer books will be closed from nuary 29 to February 9, as provided by the y-laws of the company.

DODGE WORKERS GET BONUSES

Bonuses representing from 10 to 15 per cent f wages earned in 1919 have been paid to mployes of Dodge Brothers who have been ith the company five years. The amount paid ut approximates $2,000,000. The force now at ork in the plant numbers about 2,000 men.

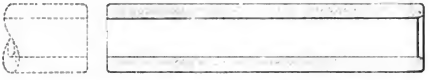
FRANKLIN CHANGES HOOD DESIGN

Among the automobile manufacturers show- ng models with distinct changes at the New ork show is the H. H. Franklin Manufacturing ompany, Syracuse, N. Y., maker of the Frank- in air-cooled car, the latest models of which ave a new design of hood of a distinctively oreign character, suggesting slightly the talian Fiat. The former Franklin hood resem- led the early Renault type, although broader nd more graceful. This has been eliminated.

LANSING MAN INVENTS SNUBBER

The Korff snubber has been invented, pat- nted, and will be made and marketed by rancis J. Korff, Lansing. It is a simple netal drum with spring attachments and astens to the frame of the automobile to pre- ent the body from bounding. The snubber vill add less than 10 pounds weight, it is aid. Mr. Korff proposes to retail it for about 7, although devices for the same purpose sell or more. Mr. Korff helped to organize the Korff Manufacturing Company, Lansing, and is ow with the Reo Motor Car Company engineer- ng division. He has perfected a number of echanical work savers which have had a ational sale. The snubber has been given a wo years' test.

GOODYEAR CHANGES FISCAL YEAR



Stockholders of the Goodyear Tire & Rub- ber Company, Akron, O., have decided to change the date of the termination of the fis- cal year from October 31 to December 31, to increase the number of directors from 7 to 11, and to create an executive and finance com- mittee.

WOOLWORTH'S 1920 SALES

Sales of the F. W. Woolworth Company dur- ing 1920 totaled $140,910,267, or $21,409,258 more than in 1919, which is equivalent to an increase of 19.92 per cent. It is of interest to note that this increase of business over the previous year is practically the amount of the sales during the last month of 1920, or in other words, the sales of December which totaled $21,521,793 practically represent the gain for the year. The last month of last year was the biggest in the history of the company. The Woolworth company now has 1,100 stores throughout the country, or 30 more than at the beginning of 1920. Several of these are in Michigan cities and the sales in Michigan are said to have been a sizeable contribution to the total.

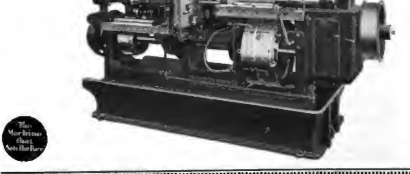
EVERYBODY HOPES TO OWN A MARMON
For Sale—The prettiest Marmon Coupe in Michigan; driven less than 12,000 miles; has a most excellent power plant and is fully equipped; everything in fine condition. Box W, Michigan Manufacturer and Financial Record, 611 Free Press Bldg., Detroit.

PISTON PINS
from TUBING

Six-at-a-Time—1000 Per Hour

1000 per hour! Six pieces every twenty-one seconds!! Less than four seconds apiece!!!

That's the story of Piston Pin production in the world's largest automobile plant. It's a simple operation—just chamfer and cut off—but what an output! Parts are made from a special grade of steel and subsequently hardened and ground.



In plants where solid stock is used the Sextuple Automatic is employed with equal advantage. Pins are first cut to length and carbonized. The hole is afterward drilled and the pieces then hardened and ground. By this method the inside of the pin is left soft.

Are you not blanking studs, nuts, sleeves, pipe couplings, rolls, pins, or other simple parts in single-spindle automaties which might be handled with *six-fold production* in the "New Britain" Sextuple Automatic—the machine that feeds, drills, faces, chamfers and cuts off *six* spindle positions *simultaneously*?

Write for Bulletin No. 955 and send samples or blue prints for production estimates.

PLUMB RETURNS TO GRAND RAPIDS

Walter K. Plumb, who has been general manager of the Clark-Cornelius Corporation, Syracuse, New York, will return to Grand Rapids, where he formerly was secretary of the Association of Commerce. He will be secretary-treasurer and general manager of the National Co-operative Oil Company.

TRANSPORTATION NEWS

Rail :: Commercial Hauling :: Water

Detroit—The Detroit Jitney Service, Inc., has been formed with a capital stock of $2,000 to carry passengers in Detroit. The incorporators are A. E. Putnam, K. L. McCunig, Charles J. Morton and Glenn M. Coulter.

Lansing—As a result of several conferences between sand and gravel shippers and railroad officials with the Michigan Public Utilities Commission, it is believed there will be a readjustment of rates to make shipping costs on these materials smaller. County road commissioners declared before the Commission that if present rates continued, road building would be curtailed.

Cleveland—Something new in the way of facilitating the movement of railroad traffic has been started in Cleveland by the railway companies with offices in the city. They have opened what is called an "Over and Short" bureau, says the Plain Dealer, the purpose of which is to match overshipments of less-than-carload freight, which one road may have received, with bills of lading for this freight which the Cleveland station of another road may have received. The bills and freight occasionally get separated, the bills falling into the hands of one road and the freight into the hands of another. To facilitate the rapid matching of such disparities, the new bureau has been established.

New York—A contract for rails involving more than $8,000,000 was placed a few days ago by the New York Central Railroad. It is said that the order calls for 175,000 tons of steel rails to be delivered during the present year and that the contract price was $47 per ton. The Carnegie, Illinois and Lackawanna steel companies are said to have each received a percentage of the business.

Lansing—Charles F. Warden, manager of the Michigan Northern Railroad Company, who is in the South, will go to Washington, D. C., before returning to Lansing to attempt to reopen the case of the company before the Interstate Commerce Commission, which denied its petition, holding that a sufficient showing had not been made to warrant a road from Lansing to Midland, Bay City and Mt. Pleasant.

Detroit—Part of the equipment contracted for by the Michigan Central Railroad has been received. The railroad has ordered rolling stock and other supplies to the amount of $5,050,000, for which bonds and notes payable to the New York Central, of which the Michigan Central is a subsidiary, have been issued. This equipment comprises 26 locomotives, 35 cabooses, 38 passenger, baggage, dining and postal cars and 1,950 freight, refrigerator and stock cars. During the last year the railroads of the country spent $349,500,000 for new equipment, of which $135,000,000 was for 45,000 freight cars. Financial arrangements are being made for the purchase of 40,000 more freight cars; 15,000 refrigerator cars, to cost $67,500,000; 1,500 locomotives, to cost $105,000,000, and 1,200 passenger cars, to cost $42,000,000. The Pullman Company has ordered 500 new cars.

Lansing—Negotiations which will affect the transportation facilities of a dozen east side factories are pending between the Grand Trunk Railroad Company and the officials of the Lansing Connecting Railroad. It is understood the Grand Trunk has offered to purchase the connecting line, and if this plan is carried out it will assure connection with the trunk line, giving the plants two outlets, one over the Pere Marquette and other over the Grand Trunk. The Lansing Connecting Railroad was organized by the late J. H. Moores to care for the future business of factories which might locate in the southeastern part of the city. It recently has been re-organized with the following officers: President, H. M. Weed, Lansing; vice-president, H. O. Moores, Rutherford, N. J.; secretary, S. V. Weed, Lansing; counsel, Joseph H. Dunnebacke; general manager, R. R. Darwin.

No Further Price Cut, Ford Assures Dealers

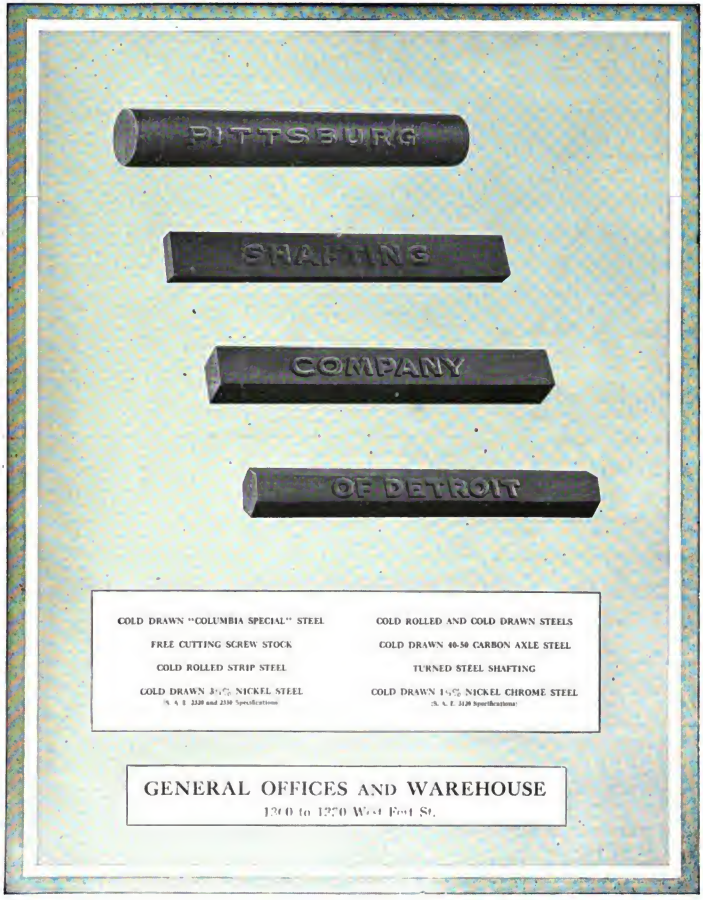
The Ford Motor Company has sent the following letter to its dealers:

"Several inquiries have recently come to us concerning the likelihood of another reduction in the price of our cars, and as these inquiries no doubt emanate from prospective purchasers, we want to state again with greater emphasis that Ford cars are already being sold at a figure actually below cost and for an indefinite period another reduction or change in design is entirely out of the question and not at all contemplated.

"We believe the public will be fair enough to fully appreciate the frankness of the above when they consider the extent of our recent price cut, which was in fact the equivalent of several reductions in one, in our desire to contribute toward satisfying their demands for lower living costs, notwithstanding our sacrifice in making these figures a loss until we are able to materially reduce present costs through lower material prices and greater manufacturing efficiency. While we have of course made some progress in bringing down operating costs, we still have a long way to go before any thought can be given further reductions in present car prices, so we have no hesitancy in making these open statements to acquaint you with the true situation.

"You can therefore give assurance to prospective purchasers of Ford cars that now is their real opportunity to buy below cost and obtain delivery. Everyone is familiar with the heavy demand for Ford cars in the spring, and this year will be no exception, as in spite of conditions, business is already rapidly accumulating so that many who desire Ford cars will be obliged to wait perhaps until midsummer for delivery, causing considerable inconvenience and possibly financial loss, particularly to commercial customers.

"We expect you to protect the interests of prospective buyers in your community by placing these facts before them."



TO WRITE AUTOMOBILE INSURANCE

The Kennedy-Morris-Ames Company has been organized in Grand Rapids to act as representative for the Michigan Automobile Insurance Company in the Furniture city and western Michigan. The members of the firm are William M. Ames, Henry J. Kennedy and William T. Morris. Headquarters are in the Houseman building. The Michigan Automobile Insurance Company was recently incorporated with capital stock of $250,000.

CITY MANAGER HALL RESIGNS

A. W. D. Hall, city manager of Jackson since the removal of former City Manager Cummins to Grand Rapids, has notified the city that he will become city manager of Tampa, Fla. Mr. Hall is president of the National Association of City Managers.

INDUSTRIAL BUILDING

Progress, Projects and Contracts of the Week

Lansing—M. H. Hunt & Son, one of the oldest dealers in hee keepers' supplies in the country and the first in Michigan, plan to increase the storage capacity of the local plant, this spring.

Grand Rapids—The Consumers Ice Company has decided to increase its capitalization to care for expansion, which will include an artificial ice plant. A. B. Knowlton has been elected president of the company; Arthur S. Ainsworth, vice-president; C. Carroll Follmer, secretary, and N. Fred Avery, treasurar.

Lansing—Jesse R. McCarthy, secretary and sales manager of the Longstreet Lumber Company, Lansing, declares that lumber prices have reached the bottom and any unusual demand will create competition with a firmer market.

Detroit—Albert Kahn, architect, has been engaged to prepare plans for and supervise the construction of a new police headquarters building, six stories high, of stone, and to cost $1,500,000.

Grand Rapids—Public Service Director Wagner announces that his department will spend approximately $1,096,505 in street improvements and sewers this year, giving employment to 300 men.

Detroit—During the week ended January 5 nothing out of the ordinary transpired in the local building industry, due principally to the holiday period, but it is expected that from now on there will be increased activities. Architects reporting to the Detroit Builders & Traders' Exchange announced that general contracts had been let for the construction of a two-story school and basement building; a one-story and a two-story branch library; also for finishing work on several buildings, such as a factory, a garage and storage structure, an office building and some stores and flats. Most of the reports from architects as to work contemplated involved minor jobs.

Lansing—Gross Brothers, contractors, have begun their work on the spring building campaign because of the favorable weather. Contracts for material have been awarded to the Rikerd Lumber Company and work on two houses has been started by Sherman McDonald. They will be the first of 20 or more which Gross Brothers will build on vacant property during 1921.

Grand Rapids—During the first week of January building permits taken out in Grand Rapids totaled double the amount expended for such work for the corresponding week in 1920.

Lansing—Tentative plans for the new detention hospital to be erected by the city have been approved by the board of health, and if the final plans are satisfactory, work will start early in the spring. The building will be equipped to care for 44 cases, 30 in emergencies, and the cost will be approximately $85,000.

Reforestation Measures Proposed for Legislature

Legislative proposals for the conservation of Michigan's diminishing forests; progressive reforestation and more adequate fire protection, were drawn up to be submitted to the state legislature at a meeting of the state forestry committee of the state, last week. The session was called by the Michigan State Farm Bureau.

A farm bureau questionnaire circulated in every county in the state indicated almost solid public sentiment in favor of careful conservation of Michigan's forest resources, together with sane methods of taxation that will not virtually prohibit reforestation efforts by individuals. Taxation of forested and reforested lands on a basis of their bare land value, with the timber and products taxed only at the time they may be marketed, is a part of the Bureau's legislative program. Present tax methods permit taxes to pyramid over a series of years, thereby encouraging early cutting of timber and discouraging replanting.

According to the Bureau, there is much dissatisfaction throughout the state with present administrative methods in forestry control and conservation, and in fire prevention.

TO BUILD FACTORY TRUCKS

The Lansing Company, Lansing, is pushing its lumbering operations in the central part of the state. It has four camps and mills organized, with a fifth mill planned. This company is also negotiating for a large additional timber acreage. Manager Harry E. Moore estimates that the four mills will manufacture more than 2,000,000 feet for the company's use. About 75 men are employed in the timber operations to date. Tracts owned by the company and which were left standing a year ago because of labor scarcity, probably will be cut this year. Both the plants in Lansing and Poughkeepsie, N. Y., are being operated at capacity. The latter, recently acquired, is one of the oldest manufacturers of wheelbarrows in the world. It is proposed, however, to equip this factory during the year for the manufacture of Reyn-Olds factory trucks and trailers, which will require new machinery and a larger force of men.

FARGO COMPANY INCORPORATED

The Fargo Engineering Company, consulting engineers, Jackson, has been organized with a capital stock of $50,000, all paid in, and articles of incorporation filed. The officers are William G. Fargo, president; Horace S. Hunt, vice-president, and Rolla G. England, secretary-treasurer. The new company is a development of the engineering office opened 30 years ago by William G. Fargo, who has been identified with industrial power development and investigation in the Middle West for the last 20 years.

MAKE LICENSE TAGS IN PRISON

Manufacturing automobils license plates for the state is the latest industry added by the Michigan State Prison at Jackson. The new plant will be in operation by the latter part of February. Warden Harry L. Halburt will go to Boston this month to order the necessary machinery. Warden Hulburt decided to add the auto license plate plant on the suggestion of Secretary of State Charles J. Deland, and it is expected the state will save $24,900 a year by its operation.

NEW ERA PAYS BONUSES

The New Era Spring & Specialty Company, Grand Rapids, has paid its employes the customary annual bonuses, consisting of $100 to those having served one year and more and $50 to those with the company from six months to one year. In addition, notwithstanding the slackening of industry, the company has also made up a list of employes to be entitled to an unestimated amount, which is to be decided upon later and which will be given them when general conditions have improved.

Commerce Chamber Policy Brings Adrian Industries

Adrian entered the year 1921 a much better advertised and a much more active community than when it greeted the New Year of 1920, thanks to its Chamber of Commerce. Its bids for industry have given other communities throughout the state something to think about. The Chamber of Commerce rented four buildings formerly used as car shops by the New York Central and converted them into factory units.

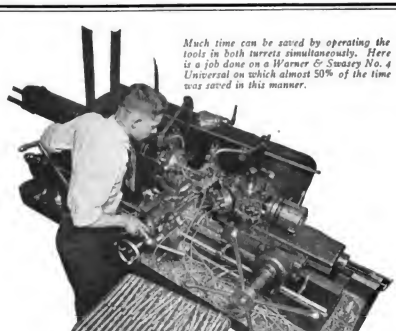
Two of these buildings were occupied by the Erwin Foundry & Manufacturing Company, which has outgrown its quarters and would like to have help in financing a factory building. The Mott Manufacturing Company occupied another one of the buildings and has been building its business up rapidly. The fourth building, however, remains unoccupied. Its dimensions are 40 by 120 feet.

When the Atlas Tractor Company, Detroit, signified a desire to locate in Adrian, the Chamber offered to provide a plant with 20,000 square feet of floor space, which the company accepted. The Nelson-Knechtel Tractor Company also desired to locate in Adrian, but has not yet accepted the offer of factory space made by the Chamber of Commerce.

A 10-acre site and financial assistance in erecting a plant was offered the Utility Compressor Company, Detroit, and it is believed the company will locate its iceless refrigerator plant in the city. The inability of the Van Camp Packing Company to obtain milk supply for its condensery plant caused the Chamber to appeal to the farmers to furnish milk so that the plant would not be closed.

The Chamber has approved the request of the Lenawee County Telephone Company for increased rates, but the Chamber believes the rate increase should be allowed only on the promise of the company to effect betterments in service.

DEEDS DETAIL FORD PURCHASES



Some idea of the extent of the land purchases made by Henry Ford in the Upper Peninsula of Michigan last year may be had from the publication of the first deeds showing the transfer of some of the properties. The total shown on the deeds was of 65,274 acres in Iron county and 38,762 in Baraga, or, all told, 104,036 acres.

The records in Baraga county refer to the property as coming from the Chase S. Osborn interests, and mention 13,175 acres of mineral lands and 25,587 acres of real estate, or a total of 38,762 for the county. In the case of Iron county the records show one transfer of 51,348 acres and another deed for 13,926 acres, or, all told, 65,274 acres.

In the case of the Iron county transfers, there is attached to the document concerning the 51,348 acres revenue stamps to the extent of $300, thus indicating a price of $300,000, while the $80.50 in stamps on the second deed indicates a transfer value of $80,500, making the total $380,500. This does, however, in no way represent the actual value of the properties bought. They are estimated to be worth many millions.

MACHINE SHOPS IN LARGER QUARTERS

Two of the young machine shops of Battle Creek have just moved into larger quarters. Growth during the last year has forced both concerns to seek more adequate room for the manufacture of their products and general jobbing work. The U. S. Burton Welding Company has moved into a one-story structure recently completed at 10 Short street. The Adolph Johnson Structural Iron Works is expanding, taking over the quarters left vacant by the Burton works.

Much time can be saved by operating the tools in both turrets simultaneously. Here is a job done on a Warner & Swasey No. 4 Universal on which almost 50% of the time was saved in this manner.

A Production Engine Lathe

This is the right term for the Warner & Swasey No. 4 Universal Turret Lathe, as it does all that an Engine Lathe can do, and a great deal more. The carriage with feeds in both directions and equipped with the standard taper turning and chasing attachments, makes it capable of doing all kinds of work accurately and quickly.

Two No. 4 Universal Turret Lathes at the Kelsey Wheel Company, Detroit, have just replaced six Engine Lathes in their tool room. Other tool rooms in great number use these machines for blanking out taps, reamers and other tools that take so much time on Engine Lathes.

Are you doing work on an Engine Lathe that should go on a Warner & Swasey No. 4 Universal Turret Lathe?

MICHIGAN MANUFACTURER AND FINANCIAL RECORD

EDITORIAL

DETROIT, SATURDAY, JANUARY 15, 1921.

The Tax Exemption of Municipal Bonds

SOMEBODY, wittingly or unwittingly, opened up quite an extensive field for tax discussion in the Detroit Free Press the other day when a suggestion was made regarding the repeal of the exemption of taxes on municipal bonds in this state. The field so opened is especially wide nowadays in view of the tax conditions in Michigan.

We have been spending so much money in this state that the old time figures of state appropriations have become obsolete, so far as expressing the demands of the various agencies of the state for money with which to carry on their activities.

As a consequence, not this year nor last year, but for some time back there has been demand for new sources of state revenue. It was to meet this demand in its incipiency that ex-Gov. Osborn, during his term of office, suggested what was then known as the "corporate excess" tax, and is now quite familiar to federal taxpayers as the excess profits tax.

There have been other suggestions. When we had timber enough standing in this state to make the proposition plausible there was a demand for a timber tax. The proposal for a tonnage tax upon iron and copper ores is neither a new nor an entirely dead one. The Grange has this year declared for a state income tax, although the Lord knows that a people who have had to do with a federal income tax should have no ambitions to impose a state income tax as well. All the time there has been an insistent demand on the part of the people of the various counties for higher and more favorably allocated assessments of the real and personal property in the various subdivisions of the state which are by law made units of assessment.

It will be surprising if, in the general hunt to find new sources of public revenue and new subjects of assessment, there is not considerable attention paid to the exemptions which have been set up for various reasons. So long as any property outside that devoted to religious and educational uses is exempted from taxation there is bound to be complaint about discrimination.

The exemption of municipal bond issues from taxation was the result of a long propaganda which had as its basis the theory that such exemption would bring into investments of this kind large sums of money, already held in the state, at a lower rate of interest than the commercial rate usually ruling. As a matter of practice, under the operation of the law the interest rate for municipal securities has generally followed the commercial rate, being one per cent below it. When the exemption was first made the average rate of taxation on the general property of the state was about one and a quarter per cent. So that the practical effect of the exemption was to give up a cent and a quarter of taxes for a cent of the interest rate, which was not wholly a bad bargain when everything was taken into consideration.

Among the other things considered was that, under conditions of taxation the money which was intended to be attracted to municipal securities would normally remain hidden, and that the interest reduction was nearly a clear gain in the long run.

Conditions have materially changed since the law was passed in 1909 for the exemption of municipal securities from taxation in Michigan. To begin with, the average rate of taxation has gone as high as 2 1 per cent, or twice as much as the rate prevalent when the exemption was authorized. So that, to get 1 per cent advantage on the interest rate, the people of the state are paying considerably better than 2 per cent.

Next, the aggregate amounts of the bond issues affected by the exemption are vastly greater than they were ever expected to be in 1909, when the law was passed. As a matter of fact, the best statisticians estimate the total amount of the bonds now outstanding which were issued by Michigan municipalities, school and road districts, counties and other governmental units at a sum in excess of $205,000,000, besides which $76,000,000 of bonds of other states held in Michigan are similarly free from taxation.

These are commanding figures in themselves but they are liable to even greater enlargement in the near future. For instance, the state has authority to issue $40,000,000 in good roads bonds within the next eight years, and so far no sinking fund for their liquidation has been provided by law. An official of the city of Detroit was recently quoted as saying that the authorized bond issues of the city now total $137,000,000. Of these about $100,000,000 have not been issued. The other cities of the state have proportionately large projects for the expenditure of money to be secured from the issue of bonds.

With the high money markets which now prevail for many years to come, reduction in interest on municipal securities from the commercial rate of interest is no more marked than it was when low rates prevailed. That is to say, when the money market rate on mortgage money, railroad securities, and the like was 5 per cent, municipals sold at a 4 per cent rate, showing a differential in their favor of one-fifth of the right rate, or a 20 per cent reduction in the interest rate. Today with a 7 per cent market for standard railroad securities, the municipal rate is 6 per cent, showing a differential of but one-seventh of the high rate, or a 14 per cent reduction in the interest rate. Meantime this one per cent of reduced interest rate is being paid for by an exemption from a tax rate of approximately two and one-half per cent.

The result of this condition has been further complicated, to the detriment of the general taxpayer, by the operation of the federal income and excess profits tax. Congressman McFadden, chairman of the committee on banking and currency of the National House of Representatives, has been considering the subject from a federal taxation view-point. The federal government can't tax the income from these bonds, either, any more than the state,—and there are many other states than Michigan which exempt this class of securities—and Mr. McFadden has been looking at this income with an eye to taxing it.

The federal government does tax the income on several classes of Liberty bonds. The money for these securities was obtained from the people at a low rate of interest to help nay the bill for making the world safe for democracy and backing up our good boys who went abroad to the war with the material things with which to make war. The market value of these bonds has shrunk as much as 15 per cent in the cases of some of the issues. Yet the income on even these discouraging holdings is subject to taxation by the federal government, after the amounts of the holdings have passed certain limits of exemption. In other words, it is a fact that the income on millions of federal government bonds paying low rates of interest, and issued to get money with which to support the national arms, is taxable, while a sewer bond issued by a Michigan village is taxable neither as to its principal nor its interest.

It is this condition which has very naturally brought about the attractiveness of these investments in preference to investments in real estate or industry which would have to bear the burden of supporting the federal, state and municipal governments. Chairman McFadden has given out information showing the desirability of these securities for investment, in preference to real estate and industrial investments, from which the following statements are taken, with him as their authority:

Digitized by Google

"To a man with $100,000 a year income, a 5 per cent tax exempt bond is the equivalent of a 7 3-10 per cent taxable bond.

"To a man with $1,000,000 a year income a 5 per cent tax exempt bond is the equivalent of a 14 9-10 per cent taxable bonds.

"In other words, so far as a man with a $1,000,000 a year income is concerned, he is justified in demanding that the taxable commercial bonds he buys yield the equivalent of nearly 15 per cent interest if they are to be as valuable to him as the 5 per cent tax exempt bonds that he may buy in any market of the nation."

When these figures are adjusted to the interest rates now prevailing for tax exempt municipal securities, which are 5½ and 6 per cent, they show a desirability of 5½ per cent tax exempt bonds in the two cases quoted above which shows them to be equal to 7.665 and 15.69 per cent returns as compared with industrial and real estate investments, while 6 per cent bonds are proportionately more attractive.

The results of these conditions so far as they affect Michigan industrial and real estate investments are very striking. Nearly a decade of years ago, when tax free bonds were a rarity, a Michigan millionaire told the writer that he was then the holder of $5,000,000 of such securities. The settlement of his estate recently disclosed the ownership of as many more, subsequently acquired. The testimony in the Ford-Dodge suit of some years ago disclosed the distribution of earnings of the Ford Motor Company to others than Mr. Ford to be so much, taken into account with the sums paid these associates of the great motor manufacturer for their respective holdings of stock when he bought them out, that the total is in the neighborhood of $150,000,000. So far as any public knowledge exists not 10 per cent of this huge sum has reappeared in real estate or industry, the ordinary subjects of taxation. Mr. Ford's share has so reappeared and is the subject of taxation. As to the rest, the information which comes to us from bond salesmen and others of authority is that practically 90 per cent of these gains has been invested in the class of securities which we are discussing.

Michigan has become notoriously a sinkhole in the Middle West for tax-free bonds. The great aggregations of personal and family capital which resulted from the gigantic fortunes so rapidly made in the automobile and collateral trades within a few years made such investments attractive, partly from the generosity of return which they showed, partly from the ease which they furnished investors to lay away their money in places where neither risk nor trouble were involved, and partly, in the later days, because of the absolution from federal income taxes which these securities carry with them.

It may be questioned whether any repeal of the exemption now existing will apply to bonds already issued. There are three sides to this. First of all, the law only applies to bonds issued since the act of May 13, 1909, granting such exemptions, was passed; yet easy-going assessors throughout the state are exempting municipal bonds issued before the law did apply. Next, there is a question whether bonds which were issued without an express contract of such exemption can continue to carry the benefit. Third, it is a well settled principle of taxation that the same sovereignty which grants exemption from public burden may withdraw the exemption when the public good or the public needs call for different treatment.

But regardless of these reasons, the municipalities of Michigan will probably issue as much in the next five years in the way of interest-bearing evidences of debt as the aggregate now existing, and if we can avoid, even only as to them, the continuance of the process of exchanging a two and one-half per cent exemption for a one per cent saving in the interest rate we will be doing some good bookkeeping and some accurate cost accounting, and quit fooling ourselves that we are working out an economy when we are only transferring the burdens of government from one kind of property owned in the state to all the other kinds of property.

The people who are looking for new sources of public revenue may very well take a squint at the possibilities that lie behind the repeal of the law exempting municipal bonds from taxation in Michigan. True, some of the capital involved will be re-invested in similar securities originating in other governmental jurisdictions; but not all, nor nearly all of it will go into such investments. As a matter of fact most of the people who invest in such securities would be most likely to turn to real estate and industry as sources of profit, and become at once normal contributors to the carrying of the state's burden. There would be more money for factories, more money for farms, more money for housing projects, all of which are safe and attractive.

There need be no fear that our markets for our public securities would fade away, either. There will for a long time be a sufficient demand from insurance companies, trusteeships and estates outside Michigan and within it to supply the funds on fair terms. There is always a market for long time securities, backed by the taxing power, at fairly low rates of interest. But, whatever the interest rates paid under such a condition they would be open ones, and not composed of two elements, one the rate paid, the other the amount of the exemption.

If the farmers and the representatives of the city homeowners, who are mostly working people, and who are all complaining of the unequal distribution of taxation, were really smart they would find new reliefs from increased taxation in the quarters to which they themselves have been granting exemption in the past.

Short Measure Stuff

THE TIME CLOCK

Ho, for the days when we once more
Might punch the clock by the factory door;
Ho, for the jingle of a bell,
Which says we may work if we do it well!

Days of fortune, days of trial
Stand recorded from that dial;
The winners and failures of industry,
Here find the same opportunity.

When the boys rang in with smiles and cheer,
The clock was a joyous thing to hear;
It greeted Bill and Ed and Jim
In a way that filled them with pep and vim.

When the demagogue sang his hymn of hate,
The clock rang fear out of the men in late;
It seemed to tick with a saddened noise,
As if it missed something in its boys.

And when the factory had to close,
Something within that clock just froze;
It ticked off the minutes in listless style,
As if it missed every worker's smile.

Then ho, for the days when we once more
May punch the clock by the factory door;
Then ho, for the days when we might get to,
The jobs that the Lord wants his boys to do!

THE FLINT JOURNAL HAS THEIR NUMBER—IF THEY HAVE ONE

THE BAFFLING RACE

Have you observed how, when you've watched the race
(The human one, I mean), and reached a base
To form a working prejudice, you mate
Then knock your fond conclusions through the fence?

I love all automobiles like the pest;
They've spoiled my walks; they mar my Sunday rest.
The folks who drive them often seem to vie
In manners with the inmates of a sty.
Then, when I've cursed them to my utmost gift,
Some cheery party offers me a lift.
If politics I damn with sweeping fling,
Some politician does the upright thing.
And so it goes. With many a hearty jibe
I used to roast the car conductor tribe,
Till, when I boarded car the other day,
A member of it wouldn't let me pay.
Alleging that—It's gospel truth I swear—
The week before I'd dropped a double fare

The more I live, the less my feeble mind
Gets, as it were, the number of mankind.
—Wamba in the Flint Daily Journal.

FINANCIAL

THE BUSINESS OUTLOOK

By PHIL S. HANNA

JUST WHAT has caused it is not clear, but the change in sentiment during the past week is remarkable. Outspoken optimists abound, whereas two weeks ago the average man put forth optimism for publication only, and in his private conversation gave way to expressions of fear and doubt. Statistics follow along about in the same order as the undertaker, and while they help to explain why things have happened and also help to point the way to the future, the actual changes that are taking place now which are resulting in the spurring-up of business will only be known a week or a month hence. But the fact remains, do we care what the reasons are, so long as there is improvement?

In Detroit the store windows from the price standpoint begin to look like 1914. A suit with extra trousers for $30, and a good overcoat for $25. There is more tangible proof of revival in the reopening of several automobile plants on a part-time basis. From the East there is word of much resumption of work in the textile and shoe lines and from the West there are more reports that the farmers are beginning to let go of part of their crops.

Foreign exchange rates continued their rise up to Wednesday. The falling off of exports with a continued steady flow of imports would make a rise in rates the logical conclusion. The market for foreign exchange has withstood the offering of large batches of bills several times during the week without weakening, and funds heretofore tied up in speculation of this sort should begin to make themselves manifest in other directions. The bank report of December 31 by the Federal Reserve Banks, which exhibits the changes in condition of the member banks, lends further encouragement. Deposits increased some $315,000,000 the last week of December, and the borrowed money obligations of the member banks were reduced about $72,000,000.

A significant event locally was the rapidity with which the new Detroit Edison bonds were subscribed. It is stated that the issue was something over a million oversubscribed, running that total up to something like $6,500,000, and within a few minutes after the books were opened it was difficult to obtain definite promises of delivery from dealers.

Detroit stocks as well as others the country over have been gaining in market value steadily since the first of the year, which, while not a conclusive barometer of the future, has much weight; and particularly when viewed in connection with the rise in the bond market, there is much evidence that money is going into industry again with confidence.

The big Ford plant at Highland Park has been closed two weeks without antoward effect locally, and this in itself is evidence that reserves of the people are strong. The bank statements show that savings deposits in Detroit have suffered but little since September 8, two banks showing increases in savings deposits and the others showing small decreases of varying amounts.

The pendulum appears to have started back with a good deal more of speed than was thought possible a week before Christmas.

Detroit Bank Changes

American State—Richard M. Heames, treasurer of the Victor Screw Mfg. Co., Detroit, and a member of W. E. Heames & Company, has been elected to the board.

Dime Savings—T. W. Palmer Livingstone becomes vice-president as well as cashier, and Edwin Herzog is also given vice-presidency as well as management of branches.

Peninsular State—H. H. Elferton becomes vice-president; Harry Moxon is promoted from assistant cashier to cashier; E. J. Obendorfer, formerly deputy bank commissioner of Ohio, becomes assistant cashier. H. L. Chittenden, vice-president and credit manager, is added to the board of directors.

Bank of Detroit—George B. Judson, vice-president, is added to the board.

Peoples State—Leo D. Heaphy becomes assistant cashier and manager of branches. He was for three years manager of the Woodward avenue branch.

First State—Herman Darmstaetter has been elected a director, filling the vacancy caused by death of Gustav Darmstaetter.

National Bank of Commerce—Dwight B. Lee, president of the Motor Products Company, becomes a member of the board of directors.

Merchants National Bank—Frank A. Duws and Richard M. Schweitzer becomes assistant cashiers, both having been with the bank since organization.

Highland Park State—Clarence H. Booth, Edsel B. Ford and George L. Bahl have been added to the board and Henry Ford has retired. The board has been increased from nine to fifteen.

United States Mortgage Bond Company, Ltd.—Wm. H. Gregory, of Gregory, Mayer & Thom; N. P. Hull, Lansing, and J. B. Sperry, Port Huron, are now members of the board. Frank McMillan, who moved to California, has retired.

Current Investment Offerings

Contributions to this list are accepted from investment banking firms of recognized standing. The purpose is to present in consolidated form to our readers a review of investment offerings of interest. Where more than one price for same security is received from two or more dealers, the lowest price will be used. Lists should be in not later than Wednesday noon.

Watling, Lerchen & Company—Detroit City Gas Company General Mortgage 5's, due July 1, 1932, at price yielding 7.50 per cent; Detroit Edison Company 8 per cent Convertible Debentures, due January 10, 1933, at price yielding 8 per cent; Detroit, Monroe & Toledo Short Line Railway First 5's, due January 1, 1933, price 86, yielding 7.50 per cent; Detroit & Port Huron Shore Line First Mortgage 5's, due January 1, 1950, price 70, yielding 7.50 per cent; Steel & Tube Company of America General Mortgage 7's, due January 1, 1935, price 93.25, yielding 8.40 per cent; Sinclair Consolidated Oil Corporation 7¼ per cent Convertible Notes, due May 15, 1926, price the week 98.75 per cent; Cooper Underwear Company First Mortgage 7½ per cent bonds, due serially, price yielding 7.75 per cent.

Michigan Bank Elections

BAY CITY

First National—President, Wm. L. Clements; vice-presidents, A. E. Bousfield and Frederick T. Norris; vice-president and manager, Irving H. Baker; cashier, H. J. Martin; assistant cashiers, Ira Bricker and A. C. Harrison; trust officer, J. C. Shaw. The directors are: Wm. L. Clements, A. E. Bousfield, Gustaves Iline, C. R. Wells, G. A. Prescott, E. S. Clark, W. E. Carter, H. F. Smith, C. F. Hutchins, I. H. Baker, F. T. Norris, S. P. Cranage, D. L. Galbraith, F. W. Bradley, L. E. Oppenheim, O. E. Sovereign, R. B. Eddy and G. D. Jackson. The only change from the officers last year was the election of F. T. Norris as vice-president to succeed the late H. B. Smith.

Bay County Savings—President, Wm. L. Clements; vice-presidents, A. E. Bousfield, F. T. Norris and I. H. Baker; treasurer, W. E. Carter; assistant treasurer, G. A. Heimreich and W. S. Dicken. The directors for this bank are the same as for the First National Bank.

Farmers State Savings—President, Frederick Mohr; vice-presidents, Samuel Meister and C. G. Olmstead; cashier, W. R. Fotheringham; assistant cashiers, D. J. Cody and R. S. Bamford. The directors are Fred Mohr, Samuel Meister, C. G. Olmstead, B. J. Henderson, J. P. Ittner, M. L. Jacobson, J. E. Kinnane, W. P. Kavanaugh, John McLaurg, John Meyer, P. C. Pardee, J. R. Petty, August Quinnell, C. A. Traphagen, W. S. Fotheringham.

People's Commercial and Savings—President, James E. Davidson; vice-president and cashier, James R. Watrous; vice-presidents, Guy H. Moulthrop and J. R. Tanner; assistant cashiers, C. H. Cook, G. H. Watrous and Randall E. Graves. Directors, W. H. Boutell, E. B. Chatfield, C. H. Cook, J. E. Davison, James Davidson, F. C. Finkenstadt, George H. Jennings, C. G. Kilgore, Guy H. Moulthrop, C. E. Pierce, W. H. Sharp, J. R. Tanner, G. A. Tompkinson, J. R. Watrous, J. C. Wsadock, L. J. Wsadock and C. C. Whitney. Guy H. Moulthrop succeeds the late C. R. Hawley as vice-president.

Bay City—President, Geo. H. Young; vice-presidents, James Duffy and John Ross; cashier, David Miller; assistant cashiers, J. L. P. Sherrer, J. C. Kinney and J. F. Asman. Directors, F. E. Tyler, John C. Ross, Carroll Windiate, David Miller, J. K. Duffy, T. L. Handy, G. H. Young, H. A. Valiez, N. R. Wentworth and E. Wilson Cressey.

CHARLOTTE

Eaton County Savings—Directors, George H. Spencer, Albert Murray, E. D. Barber, M. Vomberg, W. B. Fulton, H. T. McGrath, C. E. Fisher, Ned B. Alsover. Officers: Geo. H. Spencer, president; Albert Murray, vice-president; Ned B. Alsover, cashier; C. E. Fisher, assistant cashier; E. Shotwell, auditor; C. O. Romney, teller.

First National—Directors, J. M. C. Smith, R. S. Preston, George L. Bennett, F. H. Pollard, Winson Geddes, C. S. Brown, D. F. Munger, C. A. Fulton. Officers: J. M. C. Smith, president; F. H. Pollard, vice-president; C. S. Brown, vice-president; R. S. Preston, cashier; W. J. Hauenstein, assistant cashier.

U. S. MORTGAGE BOND ELECTION

The United States Mortgage Bond Company, Detroit, has elected John S. Haggerty vice-president and George H. Kirschner treasurer. Howard C. Wade continues as president and James H. Means as vice-chairman. This company lends money on first mortgages in Detroit and sells bonds issued against the mortgages. Starting with a capital of $50,000 in 1915, the company has increased it to $500,000 paid in and has resources now of $3,600,000. During the life of the company it has lent about $4,000,000, of which $2,300,000 is now outstanding. Dividends of 16 per cent were paid during 1920 and the outlook for 1921 is considered very promising by the officers. A complete list of directors is given elsewhere in this issue.

SECURITY TRUST PROMOTIONS

Acknowledgment of faithful service is reflected in several official advancements announced by the Security Trust Company, Detroit.

Walter B. Hayes, formerly office counsel, is now trust officer; Robert L. Nixon has been advanced from assistant secretary to treasurer, while C. Thomas Darnton, Harry R. Gleason and Fred L. Adams have been appointed assistant secretaries.

H. B. Grimm has been appointed manager of the business extension and publicity departments.

Frank P. Book, of the Book Estate, has been elected a member of the board of directors.

New Export Problems

Mere order-taking in foreign trade has had its day. Though American shipments of foods, merchandise and materials over-seas continue large, exporters in every line recognize that the turn in the tide has come.

In future, goods that go abroad must first be sold. Customers must be sought, studied, served. Markets must be developed and connections formed on a basis of information and analysis even more exact than those required in securing business in the past.

In making contacts with unfamiliar markets—in keeping touch with changing conditions—in carrying out the financial or shipping operations required in over-seas transactions—the Irving's Foreign Service and Foreign Trade Divisions may be able to supply you with just the information, counsel or banking and commercial aid you need. For exporters—as well as importers—Irving spans all seas.

While the Iron is Hot--

While a man is still strong and able to direct; that is the time to make Wills. Delayed action so often has the value of no action at all.
There is no reason for delay in making a will. Old age is not necessary. Every family needs that protection. Take the TIME for it! Call our Trust Department on the matter. We have administered thousands of Trusts under Wills. We will be glad to make suggestions.

Ask for our new book, "WHAT YOU SHOULD KNOW" about Wills and the Conservation of Estates.

Weekly Federal Reserve Statement

[The Federal Reserve Board at Washington receives weekly reports of principal changes in assets and liabilities of the member banks in leading cities. These, in connection with the Federal Reserve bank reports, can be taken as an index to the general banking situation.]

OF 820 MEMBER BANKS reporting December 31, an increase of $284,000,000 in demand deposits, $53,000,000 in time deposits and a decrease of $32,000,000 in United States deposits is shown, together with an increase of reserve balances at the Federal Reserve Banks of $23,000,000, compared with the reports for December 24. Since December 3 there has been an increase in holdings of United States bonds and notes of more than $40,000,000, while holdings of U. S. Certificates of Indebtedness dropped off $39,000,000.

The loan burden which the Federal Reserve Banks have been carrying for the member banks appears to be easing somewhat. Accommodations of the reporting banks show a reduction for the week from $2,176,000,000 to $2,103,000,000 and represent a falling-off in the percentage of such accommodations to the total loans of the reporting banks from 13 per cent to 12.6 per cent. This tendency is further evidenced by a total reduction in member banks' bills carried by the Federal Reserve banks of $111,785,000 compared with a week ago. In fact the changes as shown by the reports of the member banks and the combined reports of the Federal Reserve Banks are in the direction indicative of larger reserves and a more liquid condition.

Total reserve notes in circulation have also started down again, the decrease for the week being $78,071,000, while the total reserves of all member banks, including deferred and uncollected items, increased $83,166,000. The reserve ratio is increased from 45.4 per cent to 46.4 per cent. After paying the accrued 6 per cent dividend, the banks paid the Government $60,725,000 of their surplus earnings, as provided by the Federal Reserve Act, as a franchise tax, and $37,291,000 was carried to surplus account, leaving those items at $202,036,000, or a fraction more than 100 per cent of the total subscribed capital of the banks.

Resources and Liabilities of the Twelve Federal Reserve Banks Combined

RESOURCES	January 7, 1921	Dec. 30, 1920	January 9, 1921
Total gold reserves	$2,080,932,000	$2,059,823,000	$2,041,371,000

All other liabilities	141,013,000	121,939,000	18,087,000
Total liabilities	6,135,719,000	6,269,517,000	6,134,127,000
Ratio of total reserves to net deposits and F. R. note liabilities combined	46.4%	45.4%	45.4%
Ratio of gold reserves to F. R. notes in circulation after setting aside 35% against net deposit liabilities	52.1%	50.5%	51.5%

BANK DEBITS

Aggregate debits to individual account, as reported for banks in 154 of the country's leading clearing house centers for the week ended January 5, were 10,535 millions, compared with 5,507 millions for the previous week, both weeks having five business days. Larger totals are reported for all the leading centers, for the increase for New York city alone being 171 millions, more than 1,000 millions, die chiefly to the large volume of end-of-year payments of dividends, interest and bonuses.

As compared with the corresponding week a year earlier, debits for the week under review were 180 millions larger, the increase for New York city banks alone being about

General Financial News

MEXICAN CRUDE RUBBER

The Mexican Crude Rubber Company has notified all stockholders to deliver all of their stock certificates to the Detroit Trust Company on January 15 or as soon as possible thereafter, indorsed to the Mexican Crude Rubber Company. In exchange the stockholders will receive the new certificates of stock and the British bonds which were authorized distributed by stockholders December 21, 1920.

The action December 21 provided for a reduction of capital stock from $1,500,000 to $750,000 and for distribution of £375,000 par value of British government 4 per cent funding loan bonds of July 1919. Mention was made in our issue of December 11.

NEW PONTIAC BROKERAGE HOUSE

Hughes-Burke & Company have opened offices in the Boston Store building, Pontiac, and are prepared, according to the firm, to give Pontiac stock investors as complete a service as can be obtained in any city of the country.

UNITED LIGHT AND RAILWAYS

The United Light & Railways Company, Grand Rapids, has announced that its gross earnings for the twelve months ended November 30 showed an increase of $1,732,378 over the preceding year. The operating expenses increased $1,306,524; the net earnings, $425,853, and the balance $362,783. The net surplus earnings increased $264,843 and were equivalent to 12.9 per cent on the common stock.

DOWD MANAGES EHRMAN BRANCH

Martin Dowd, well known as a public accountant in Grand Rapids, is manager of the offices just opened in that city in the Fourth National Bank building by A. W. Ehrman & Company, Detroit, advisory accountants.

INVESTMENT CONCERN ELECTS

Directors of the Michigan Mortgage Investment Company, Lansing, were re-elected at a meeting last week, as follows: Glen R. Munshaw, William R. Town and Bert J. Baker, Lansing; William R. Burns, F. F. Tillotson and E. H. Bingham, Detroit; Frank B. Coleman, Grand Rapids, and H. J. Smith, Jackson. The company is engaged in a general financing business. The volume during December was greater than the preceding two months. President Munshaw said there had been a decided improvement in business the last few weeks.

CONTINENTAL MOTORS MEETING

The annual meeting of the Continental Motors Corporation, Detroit and Muskegon, will be held January 10 in Richmond, Va., for the election of directors and authorization to authorize the retirement of 6,289 shares of preferred stock.

JAY JOINS SELIGMAN

John C. Jay, Jr., has been admitted as a partner in the firm of J. & W. Seligman & Company, New York. The new member is regarded as one of the foremost organizers in the country, says the Wall Street Journal. Mr. Jay was for many years connected with the Pennsylvania Steel Company, of which he was vice-president at the time of his retirement from the concern. About seven years ago he came to the Maxwell Motor Company, Detroit, to reorganize it. Later he became associated with George W. Goethals & Company and still is a member of this firm. For some time he was chairman of the board of the Republic Motor Truck Company, Alma, Mich., and in 1919 undertook the reorganization of the Pierce-Arrow Motor Car Company, Buffalo, becoming its president and later the chairman of the board of directors.

At Small Expense You Can Have a Financial Secretary

who will relieve you of the petty worries connected with the handling of funds, securities and property—a reliable, responsible and experienced secretary who is never ill, never on vacation and whose life is permanent. The Security Trust Company will do the many things an ordinary individual secretary would do—and many more. Then during absence on pleasure or business or during sickness, you would have peace of mind regarding your financial matters.

Shall we send an officer to talk this over with you?

The Power to Earn

Earning power eventually determines worth—whether corporate or individual.

During 1921 the earning power of many companies will be problematical.

Re-construction, re-financing, and liquidation of inventories purchased at 1920 peak prices seriously impair prospective earnings of rails, utilities and industrials.

But the earning power of our First Mortgage Bonds secured by Detroit improved incoming producing property will remain constant and unvaried—

AS TO INVESTMENT ADVERTISING

Arrangements to broaden activities to protect the public against investment in promotion schemes which misuse advertising to defraud through the sale of stock, to conserve money in legitimate business and home-building channels and to maintain public confidence in the advertisement of legitimate investment securities were discussed by directors of the Detroit Better Business Bureau at the regular meeting in the Board of Commerce, this week.

The Better Business Bureau is affiliated with the Detroit Adcraft Club and operates in connection with the national vigilance committee of the Associated Advertising Clubs of the World.

At the conference, the first to be held since the election of directors at the annual meeting of members January 3, the following officers were re-elected: President, H. P. Breitenbach, advertising and sales counsel; vice-president, Fred G. Dewey, attorney; treasurer, Jacob Nathan, secretary Detroit Stock Exchange; executive secretary, Alfred J. Pitts.

E. C. HINMAN DIES

E. C. Hinman, one of Battle Creek's best known citizens, died Tuesday after a long illness. He was head of the American Steam Pump Company and the Central National Bank. Mr. Hinman spent most of his life in Battle Creek and was a graduate of the University of Michigan. He was a leader in Republican circles of Michigan, having been a member of the state central committee. He also served on the city council of Battle Creek and was a member of the board of visitors to the Naval Academy, at Annapolis. He was a member of the board of directors of the Commonwealth-Federal Savings Bank, Detroit.

STOCK EXCHANGE ELECTION

The annual meeting of the Detroit Stock Exchange was held Tuesday. William A. Neer, P. K. Pelton and L. G. Gorton were elected for the board of governors for three years; for two years, M. W. Whittlesey, John F. O'Hara and D. A. Povah; for one year, Richard Brand, W. E. Reilly and W. G. Lerchen. William A. Neer was re-elected president; John F. O'Hara, vice-president; L. G. Gorton, treasurer, and Jacob Nathan, secretary. The membership reports a very good year, both in growth of business and in development, which includes adoption of a new constitution, inauguration of a clearing house and a greatly increased membership. Actual sales for the year 1920 were 2,416,885 shares, compared with 1,999,713 for 1919. John P. Glendon is the latest applicant for membership.

NEW BANK AT STRATHMOOR

Application to organize a state bank at Strathmoor has been approved by the commissioner of the banking department. The organizers are Howard C. Wade, James H. Means and their associates who are interested in the Rouge State Bank, Ecorse State Bank and Halfway State Bank.

Purchasing Agent or Assistant

Young executive experienced in buying general office supplies and appliances, also specializing in purchasing iron and steel and mill supplies for high grade manufacturing concern, wishes to connect with a progressive manufacturer or company. Member of N. A. P. A. Services available after Feb. 1st, 1921. Moderate salary to start. Box Y, Michigan Manufacturer & Financial Record, 611 Free Press Bldg., Detroit, Mich.

Banks and Bankers

BANKERS' CLUB ANNUAL DINNER

Dr. Marion Le Roy Burton, president of the University of Michigan, was the principal speaker at the twenty-third annual dinner of the Bankers' Club of Detroit, in Hotel Statler, January 14.

VOLKER ON MARINE CITY BOARD

John Volker, Marine City, has been made a director of the Marine Savings Bank. The bank recently paid out bonus checks to all its employes in accordance with its custom, and the 110 stockholders were given their checks. The year just ended was one of the best in the history of the bank.

PERSONNEL COMPLETED

The new national bank of Iron Mountain completed its organization January 4. The name is Iron Mountain National Bank. The officers are as follows: President, Cleo Mueller; first vice-president, Charles E. Parent; second vice-president, Claude H. Milliman. The directors include these with Z. P. Rousselle, John O. Blixt, Felix Valenti, John J. Flanigan, Olaf Rian and Dr. H. Belheimer. The new bank expects to open for business February 15. The Flanigan property has been bought for $34,500. Next spring a flue banking house and business block will be built.

MASTERS GOES TO MUNISING

Chester D. Masters, who has been cashier of the First State Bank, Petoskey, for some years past, has been elected cashier of the First National Bank of Munising. Masters has had broad experience and will give a good account of himself in the new connection.

SAVINGS DEPOSITS GAIN

Savings deposits in Grand Rapids banks for 1920 showed a gain for the year of $4,836,092. Between the bank calls of September 8 and December 28-29, the gain was $876,071. The aggregate at the end of the year was $30,143,987, a new high mark. Total deposits increased $1,076,716 for the year, and, compared with deposits two years ago are $9,200,000 larger.

NEW BANK IN STANTON

The new Peoples State Bank Stanton opened January 8 reports a satisfactory opening, resources amounting to $103,000 having been accumulated. This bank is an addition to others owned and controlled by Grant Slocum, Ealy and John R. Hudson.

FEDERAL RESERVE APPOINTMENTS

All officers and directors of the Detroit branch of the Federal Reserve Bank have been reappointed to serve for 1921. The board of directors consists of John Ballantyne, C. H. Hodges, Emory W. Clark, Julius H. Haass and Robert B. Locke. Mr. Locke was manager and chairman of the board. George T. Jarvis, who have been in employ of the Detroit branch since it opened, has been made assistant auditor. H. H. Higgins, who has been assisting J. G. Baskin, assistant Federal Reserve agent, for the greater part of last year, has been appointed an acting assistant Federal Reserve agent and will be domiciled with the Detroit branch.

WESTLAKE WITH ELSTON CO.

Frederick E. Westlake, formerly with Lee, Higginson & Company, Chicago, has joined the Elston & Company organization, 403 Real Estate Exchange, Detroit, and will have charge of the Michigan business. The Elston Company has offices in Milwaukee, Chicago and Minneapolis.

American Loan & Trust Co. Has Unique Savings Plan

A unique and one of the most complete plans so far devised by a financial institution to promote thrift among all classes of people is that offered by the American Loan and Trust Company, Detroit. This program, which is termed the Protective Savings Plan, embodies not only the saving of a definite sum, small or large, each month over a period of years, but also gives the saver life insurance for the entire amount he starts out to save in addition to the current rate of interest on his savings. A guarantee of a sound investment, at completion of the saving, in first mortgage real estate bonds, also is given. This plan covers three safe securities—savings account, life insurance and first mortgage bonds on Detroit improved real estate.

A customer may save $10 or any multiple of $10 a month over a period of 60 months. As soon as he has made the first month's deposit, the company takes out insurance for him for the amount he has started to save. Ten dollars a month would mean $600 insurance protection; $20 a month, $1,200 insurance, and so on. These monthly deposits draw interest at the rate of 3 per cent per annum, the same as ordinary savings account deposits, and the customer gets back every dollar paid in. There are no insurance premiums to be paid by the depositor. He simply makes his deposits each month with the company and these deposits are placed to his credit in his savings account.

The unique feature of this plan is that in case the depositor dies at any time before the end of the 60 months—whether it be one month after the plan has started, or several years—his wife, children or other beneficiaries receive as insurance the $600, $1,200 or other amount, and also the actual amount that the depositor has paid in, plus 3 per cent per annum, less certain costs which are very small.

Now, in case the depositor completes all the payments for the 60 months, he receives the full amount—$600 if $10 monthly deposits have been made, $1,200 if $20 monthly deposits, this total sum being paid in the shape of tax free first mortgage real estate bonds on Detroit improved property. Also, he gets accrued interest, amounting to $95.56 in cash. Thus if the Protective Savings Plan is carried out to its conclusion, the customer has a convenient means of saving something regularly, at the same time carrying insurance without extra cost, and finally without any effort or bother in making investigations as to the merits of securities, etc., his funds are invested for him, he saves, insures and invests all by this one plan.

There are many other attractive features connected with this plan, which are explained in detail in the booklet just issued by the company.

The company further points out that the tax free first mortgage real estate bonds, which constitute payment of the total sum at the completion of the contract, bear 5 per cent interest and are salable before maturity for cash at par, less 1 per cent discount.

There is still another valuable feature of the plan, in the opinion of many, and that is that the contract can be operated jointly by two persons. The advantage of this is that one person might be uninsurable, but by taking out a contract jointly with another who can be insured, the full benefits of the plan can be enjoyed. Thus a man and his wife or a man and u child could save and be insured—in fact any two persons could enter into a protective savings plan contract insuring the life of either, provided the age of the insured is over 10 years.

Michigan Bond Items

The Hanchett Bond Company, Chicago, with branch offices in Detroit and St. Louis, is offering four issues of municipal bonds yielding 8 per cent. It is doubiful whether this generation will see a recurrance of such bargains unless tax exemption features of municipal bonds are removed.

The city improvement bond issue recently authorized by the city of Detroit has been reduced from $15,000,000 to $5,000,000 because of the present money market. The sale of $1,000,000 of street railway bonds has been authorized.

By the narrow margin of one vote, Ferndale school electors have indorsed the proposed $50,000 bond issue to complete and equip the new Lincoln high school.

The Corrigan Company, Grand Rapids, recently participated in a syndicate offering $5,000,000 Consolidated Gas, Electric Light & Power Company (Baltimore, Md.) first refunding mortgage sinking fund 7½ per cent gold bonds.

It is expected that the voters of Belding will be asked in the spring to vote a bond issue, the money to be used for paving purposes.

The unsubscribed balance of the Detroit Edison $5,532,600 of 10-year 8 per cent convertible debenture gold bonds offered by a syndicate January 10, was oversubscribed by January 11 and the subscription books closed. They were offered by Spencer, Trask & Company, Coffin & Burr, Inc., New York city; Security Trust Company and the First National Company, Detroit. The bonds are due January 10, 1931, at par and accrued interest to yield 8 per cent.

Public Utilities

Jackson—Buyers of industrial power have been notified by the Consumers Power Company that the Jackson plant is in a position to provide additional power to manufacturing plants when needed. Extensive improvements have been made in facilities.

Lansing—The heat service rates have been reduced by the city electric light and water commissioners. The new rates are $1.25 a thousand cubic feet for the first 200,000 pounds used, and $1.15 per thousand for all in excess, while the former rates, raised last July, were $1.55 and $1.40.

Pellston—The Cheboygan Electric Light & Power Company dam on Maple River, near Pellston, this spring will be entirely rebuilt, according to present plans, which call for a two-foot raise of the dam, the installation of latest style water wheels and electric generating apparatus, and to be automatically and electrically controlled from a sub-station at Pellston. The present plant will be discarded.

Flint—Plans for future operations in Flint by the Michigan State Telephone Company contemplate service in 1935 to a community of 285,000 inhabitants, Supt. E. M. Gladden, Detroit, told members of the Kiwanis Club at their weekly luncheon at the Durant Hotel, last week. The actual population of the city, Mr. Gladden said, would be estimated at 168,000, with 67,000 additional in outlying districts who would expect city telephone service. This, the company estimates, will call for 40,000 telephones, or four times the present number

Who's Who In Michigan Finance

Joseph M. Conway, Deputy Commissioner, State Banking Department

Joseph M. Conway was born in April, 1890, on a farm in Isabella county, near Mount Pleasant, where he spent his boyhood and then attended the public schools. Thereafter he was a student in Ferris Institute, Big Rapids, graduating in 1907. From this date until 1913 Mr. Conway was engaged for a time in the hardware business and also obtained some banking experience, during which latter occupation he made the acquaintance of the then commissioner of banking, E. J. Doyle. Doyle was very much impressed with the thoroughness of Conway's work and when a vacancy occurred in the Lansing office of the state banking department he appointed Conway chief clerk. The duties of this job gave Conway a splendid opportunity to acquaint himself with the banking laws of Michigan and with the rules and examination methods of the department, and it was not long before his efforts in this direction were rewarded with a commission as a bank examiner. During the next few years there was a great deal of painstaking examination work to be done, mergers, consolidations and changes, and the work required the services of a patient, careful bank examiner. It was in this direction that Conway won his spurs and it began to be a custom in Lansing whenever a tough job came along, to send Conway. There have been occasions where information was desired concerning the past condition of different banks which he had examined, and it has been a source of satisfaction to the department to dig up from the old files of examination records, clear, accurate and complete details from his reports.

JOSEPH M. CONWAY

After the Federal Reserve Bank of Chicago began to accumulate a large number of state banks in Michigan as members, Governor McDougal began to look around for an examiner who was possessed of an accurate knowledge of the Michigan state banks, and who by reason of proper experience and bearing would make him a desirable representative as a Federal Reserve examiner. From the long list of high-grade men which the Michigan department has graduated from time to time, Conway was selected, and, beginning December 31, 1918, he covered Michigan and the other states of the Seventh district making examinations and reports for the Federal Reserve Bank of Chicago.

Along about February, 1920, Albert E. Manning, who had been the deputy state commissioner for many years, decided to organize his Michigan Finance Corporation and thus change his occupation from selling the other fellow how to loan the people's money to that of loaning money himself. And at this time Commissioner Merrick requested Conway to return to the seat of his former endeavors as Deputy Commissioner of Banking.

SECOND WOOL POOL PROPOSED

Representatives of 18,000 wool growers in 50 Michigan counties have decided to form a second pool under the supervision of the Michigan State Farm Bureau, and also to hold the 3,500,000 pounds of wool in the first pool for one year for better prices.

RESTRICTING IMMIGRATION

To the Editor:

I cannot agree with your views upon the matter of the restriction of immigration. Whether times be good or bad, it is obvious that the amount of goods which each individual American may have at his disposal depends upon the number of people among whom the total resources of the country must be divided. That we should permit anyone who so desires to come into the United States and share with us the benefits of this country is a short-sighted and foolish policy.

It is true that by means of immigration we shall, perhaps, be able to cut down our forests, mine our ores and in general use up the raw materials of our country much more rapidly than if we attended to this matter with our own force alone, and it is true that in so doing we will enrich a few members of the community. The ensuing generations will have to pay for this, and pay dearly.

Personally, I am a strong advocate of the entire and permanent exclusion of all immigration. I believe that the policy of "America for the Americans" is the best for us. Any immigration is undesirable. The continuation of immigration into this country will simply mean that we will gradually approach the time of over-population which is already present in many of the states of Europe, with the resulting poverty, misery and general weakness of the state. It means the lowering of the standard of living for every American and the lowering of the standard of American manhood. We cannot dilute the blood of our ancestors, who, because of the great difficulty and danger in immigration in the past, were only the most adventurous and strongest of their respective peoples, with the blood of Polish Jews, Sicilians and various kinds of Slavs, who are making up the bulk of our immigration at present, without a resultant decadence in the race which we are now proud to call Americans. We have spent billions of dollars in the importation of pure-bred horses and cattle in order that our horses and cattle might be of the finest strain obtainable, and yet we permit the coming in of the poorest of the scrub stock of Europe's manhood.

Fortunately for America the great minds of this country are wide awake to the serious menace of immigration. Steps are being taken to correct this dangerous evil. We see no reason why you should continue to advocate an out-of-date and erroneous doctrine, especially after the experience which we have had with the half-baked, unassimilated aliens in this country during the war period.

ROBERT L. FERGUSON.
(General Manager, Detroit Refrigerating Company).
Detroit,
January 5, 1921.

THE JAPANESE "MENACE"

To the Editor:

The writer having just returned from California, finds what seems to him a general misunderstanding here in Michigan regarding the so-called Japanese menace on the Pacific coast, and believes that the readers of your publication might be interested in getting the facts from first hand observation.

Before the World War, California papers were full of this Japanese menace. They told us seriously that Japan was shipping troops into Mexico and massing them close to our border line; that Japanese submarines were seen near our coast. The atmosphere became so charged with fear that some of the well-to-do, those who occupy the beauty spots on the ocean front, actually moved into the interior. Many Japanese were arrested as spies, and we were told they had maps, photographs and drawings of our forts and ports. Then Congress declared war on Germany and the Japanese troops along our border line must have faded away; the Japanese submarines disappeared and the Japanese were let out of jail. Then we appealed to these same despised Japanese to help us raise food to win the war and place democracy on the world map. They responded with a will. They thought here was their chance to show us Americans that they too could be Americans to the core.

After we placed democracy in Europe, what happened? In the last election California passed an amendment which not only disfranchises the Japanese but prevents their owning or leasing land or owning stock in any company that owns land. All that is left for them is to be our servants. I sometimes wonder who among us foreign born or of foreign descent are so important that we have the right to say that the Japanese shall not have the same privileges under the Stars and Stripes that we enjoy. Surely if there is such a thing as priority rights, it would belong to the Indian. If Thomas Jefferson could come back to life and get our present idea of Americanism and democracy, would he drop dead again?

What is really troubling California? We could ask the same question of all other states. In California motion picture houses spring up like mushrooms. Movies, movies everywhere, and yet crowds are lined up for blocks waiting to get in. It is the same with football, baseball and prize fights, and then there must be the jazz music while we eat our soup. The lectures where there is food for thought usually go unattended. We point with pride to the numerous million-dollar-a-year movie stars, but the teachers who are supposed to be the foundation of this republic have an awful time making both ends meet. I sometimes wonder if Nero is again playing his old fiddle.

Is it really a Japanese menace that is ailing us or are we who call ourselves Americans becoming a menace to ourselves? Had these Japanese been frugal French peasants instead, California would have hated them just the same. It is not a racial but an economic problem that confronts California and the rest of our country.

Here is the trouble as I see it. California land boosters have boomed a fictitious value on the land. That land which the Japanese use for truck gardening is held at from $1,000 to $3,000 an acre. The Japanese are very frugal. Their whole families will work 16 hours a day, every day in the year. They have to do this to eke out an existence. Americans cannot compete in long hours and low wages with the Japanese in tilling this high priced soil, so they get peeved, and they think it is a racial and do not see it is an economic problem. They do not see the land profiteer. In California there are still millions of acres of idle fertile land in its natural state but held out of use by land profiteers. While Californians were attending the movies, football, baseball and prize fights and while the fat cats headed south were doing the shimmy, sharpers stole their lands. Now these sharpers realize they cannot get Americans to work this high priced land, so there has been a quiet movement on foot to import four or five million coolies. Land profiteers would rather flood our whole country with cheap coolie labor than sell their land at a price that enables Americans to buy and till the soil.

How can we remedy this situation? By using our brain power. Our present system of taxation is all in favor of the slacker and suppressing industry and thrift. We are working hind-end-to. We must face about and take all taxes off things desirable and place them on the undesirable. Idle city lots, idle lands and idle mines are undesirable. Suppose we take all taxes off our stores, stocks, factories, homes and contents and instead tax the vacant lots just the same as the used lots, according to their location value. That would drive vacant lots on the market. Then the young men who are making goo-goo eyes at their best girls could buy lots. That would mean new homes, new furniture and new life. Then take all taxes off the farmers' crops, stocks, buildings and contents and instead tax the idle lands and idle mines the same as the mines or lands that are in use. That would kick the props from under the land profiteer and throw idle

land and mines on the market. It would give man the same privilege as the birds of the air, who build their nests in any place not in use. Then the Japanese will not want to work 16 hours a day and the American can then also afford to till his own soil. As soon as we are ready to attend to the duties of our American citizenship with the same alertness that we attend the movies, football, baseball games and prize fights, just so soon will our troubles disappear. It is not the Japanese who are bothering us; our trouble lies with ourselves.

GERRIT J. JOHNSON.

CONCERNING STATE TAXES

To the Editor:

Your editorials have been a source of considerable enjoyment to me in the past, as I have always discovered a distinct vein of thought which led to the uncovering and exposing of shams of all kinds.

In your issue of November 28, "Look Out for the State Taxes," you have certainly lost your punch.

You are perfectly aware that there have been for many years a band of devoted men and women who have stumped up and down the state decisiming against graft and corruption and all human folly.

They have thousands of times made the distinct promise that if given control and laws passed as they dictated, crime would be decreased, police become practically unnecessary and taxes be greatly reduced.

This element has been in absolute control for the last four years, with the result that crimes of a serious nature have increased, we cannot get enough police judges and courts and taxes have increased right along.

I should like very much to see the day arrive when these reformers are going to be asked the question: When are you going to commence to make good?

A. L. PUTNAM.

Birmingham, Mich., R. F. D. 4.

New Publications

"THRIFT AFTER MOTHER GOOSE"

The Continental & Commercial Banks, Chicago, have published a booklet on savings entitled, "Thrift After Mother Goose." This work is something entirely new in savings psychology. The book is a collection of twelve Mother Goose rhymes and drawings printed in four colors, with the original verses changed only so as to apply to the whole general idea of thrift. Thus, the Old Woman Who Lived in a Shoe says of her children, "But hunger and want are things I don't care, so I'll rear all these children and teach them to save." And Jill says to Jack, "I'll allow, I've money in the savings bank, I'll never fall down now." This freshness both in text and art work is such that the hackneyed subject of thrift is presented in more than readable light.

In three days the Continental & Commercial Banks gave out more than 17,000 copies of this book to some 15,000 people who called in person at the institution. The requests have been so heavy that the supply of copies has been exhausted.

NEW HOIST CATALOGUE

The Wright Manufacturing Company, Lisbon, Ohio, manufacturer of high-speed hoists, screws and differential blocks, and steel trolleys, has just issued an attractive new catalogue descriptive of its line. It contains much data of use to those interested in hoists. A portion of the catalogue is devoted to a discussion of the various types of hoists and the field of usefulness of each. Copies will be furnished on request.

Michigan Sweetens It

(Continued from Page 8)

taining about 30 per cent water.

As the juice became thicker by evaporation, the percentage of alkalinity increased; therefore, it has to be subjected to another settling process before it is ready to boil into sugar. This process reduces the alkalinity to a minimum and precipitates the impurities, which, in the form of lime salts, are now removed in another filtering operation. The thick, clear juice obtained from the filter presses is now sent to the supply tank, from which it is drawn for boiling in the vacuum pans.

Boiling the Syrup

In the early history of the industry, sugar was boiled in open pans over a direct flame or by heating with steam coils. Sugar crystals produced by boiling in such a pan acquire a brown color, owing to the decomposition of the sugar by high temperature. The fuel consumption is also much greater in the open pan process than in the more modern system. For these reasons the open pan was abandoned and a large tank used in which the pressure could be diminished by means of an engine and a condenser. These tanks are about fifteen feet high by twelve feet in diameter and each contains a series of copper steam coils for boiling the syrup. A vacuum is created in the tank which makes it possible to boil the syrup at 150 degrees F.

The first operation in the process of boiling the syrup is to draw juice into the pan, or tank, until it is about one-third full. It is then boiled until fine crystals, or sugar-grains, begin to appear. This has to be watched closely and a test taken every few minutes. When the sugar begins to "grain," an additional amount of juice is added and the boiling proceeds, the new juice adding to the size of the grains. After the grains form from the first lot of juice, additional juice, instead of forming new grains, increases the size of those already formed. The business of sugar boiling, however, is how much juice to draw into the tank and the correct size of the grain on which to "build," can be learned only by actual experience under the direction of an expert sugar man.

Juice is now added in the correct quantities and at the proper intervals so that by the time the tank is full the crystals will be of the correct size. The amount of juice added each time should be small enough so that the excess of water will be evaporated in the least possible time. If too much is added there is danger that the mass will be rendered so thin as to dissolve the crystals already formed. When the mass in the pan becomes so condensed that a proof placed on a glass plate will not flow away, the boiling is completed, the operation taking about four hours. The product is now a heavy, sugary syrup called filmass (German) or massecuite (French), and contains about 93 per cent solids and 7 per cent water. The boiling being completed, the massecuite is dumped into a reservoir called a "mixer," which is a huge trough through which a rotor extends lengthwise. To this shaft are attached a number of paddles which keep the massecuite stirring as the shaft turns, thus preventing the possibility of its hardening before it is needed.

Now for the Sugar

The next operation is the actual production of the sugar. If all the previous operations have been correctly handled and the massecuite has been properly boiled down, the separation of the sugar crystals from the syrup will present no difficulties. This separation takes place in what is known as a "centrifugal" machine. A centrifugal in this case is a thin brass cylinder about 40 inches in diameter and 22 inches high, finely perforated and lined with a very fine brass screen through which the moisture may pass while the sugar crystals are retained in the cylinder. When ready to operate, the massecuite is allowed to pour into the cylinder through an opening above the machine. The cylinder is filled about one-third full, then the supply is shut off and the machine is set in motion.

The cylinder, which stands upright, is driven by a vertical shaft which operates with a water motor and spins at the rate of approximately 1,800 revolutions a minute. The centrifugal force developed by the spinning wall of the cylinder and forces the syrup out through the fine holes in the screen, while the sugar crystals remain packed against the wall. When the centrifugal is stopped, it contains a lot of clean white sugar in place of the dark brown mass which was poured into it about four minutes before.

The syrup which is spun out through the wall of the cylinder is called "green syrup." This is caught by the iron shell which encloses the cylinder, and collects at the bottom, where it flows through a spout into the green syrup tank. A fine spray of water is played over the surface of the sugar before the machine is stopped, to remove the last trace of syrup from the sugar crystals, the syrup spout being shifted to a wash syrup trough before the spraying commences so that the wash syrup may be stored in a separate tank. This wash syrup is afterward used for boiling white sugar mixed with thick juice. The "green syrup" eventually is returned to another vacuum pan, where it is made into brown sugar. Brown sugar is boiled down in a manner similar to the treatment of white sugar syrup, and passes through the same centrifugal process.

The white sugar is discharged through an opening in the bottom of the centrifugal machine, where it falls into a conveyor trough and is carried into the granulator, which is a drum about seven feet in diameter and approximately thirty feet long, slightly inclined so that the sugar will work toward the outlet end, and

A BLISS ADVERTISING INNOVATION

So rapidly have new inventions, discoveries and manufacturing methods crowded upon industry since the intensive industrial demands of war widened men's vision that it has been impossible properly to digest and effectively apply them. The E. W. Bliss Company, Brooklyn, N. Y., and Hastings, Mich., die and machinery manufacturer, has adopted a unique method of bringing to the surface the best thought which is today in the pressed steel industry. The method is simple. The company will place its advertising pages in the trade papers of the country at the disposal of influential manufacturers of pressed steel in order that they may express their views of the past and present and the possibilities of the future in the industry. This offers an excellent opportunity to show how the many discoveries and inventions in the pressed metal industry will benefit manufacturers who as yet have not fully grasped the economical methods and possible production improvements within easy reach.

CHICAGO PNEUMATIC APPOINTMENTS

The Chicago Pneumatic Tool Company, New York, Chicago and Detroit, announces the appointment of R. F. Eissler as assistant to the vice-president, with headquarters in the company's new office building, 6 East 44th street, New York. W. C. Straub, formerly district sales manager of the New Orleans branch, has been appointed district manager of the Pittsburgh branch, succeeding Mr. Eisaler, and Ross Wyeth, formerly attached to the Pittsburgh branch, succeeds Mr. Straub as district manager at New Orleans.

containing a great many little shelves. The granulator is slowly revolved by means of a wheel gear, picking up the sugar on these shelves and carrying it toward the top. As each shelf nears the top in its circular travel, the sugar falls off, with the result that the air is constantly full of falling sugar. A warm air blast is directed through the granulator and before the sugar has completed its journey through the machine it is thoroughly dried and granulated.

From the granulator the sugar pours into a large bin which supplies the packing room. Up to the last year or so, sugar was always packed in barrels, but the streak of economy which hit the rest of the country has also hit the sugar manufacturer, and this year they are packing it in bags. Automatic machinery makes it possible to fill a 100-pound bag, weigh it and sew it across the end in a minute and a half.

The sulphur used in the sulphuring process is burned at the mill, about 400 pounds of sulphur being used daily. Approximately a carload of lime rock is used daily to furnish lime for the carbonation processes and also to make the carbon dioxide gas which is used in the same connection.

After the juice is diffused from the cossettes, they are reduced to a mass of soft pulp which is dried and sold for cattle feed. This dried pulp is worth about $50 a ton.

The Industry in Michigan

The first sugar factory in Michigan was built at Bay City in the fall of 1898. This was erected by a corporation known as the Michigan Sugar Company, but was not the same company as that which is organized under that name at the present time. Later the Bay City Sugar Company was organized and built factories at other points in the state. The original Michigan Sugar Company later moved its factory and equipment West and a new company was formed which included the Bay City Sugar Company, incorporating under the name of the Michigan Sugar Company. This company is now the largest in the state, with factories at Alma, Bay City, Caro, Crosswell, Saginaw and Sebewaing. The Caro factory is the largest in the state, producing 325,000 pounds of sugar every twenty-four hours. Eight other companies have also been formed, with factories located at Bay City, Mount Pleasant, Owosso, Holland, St. Louis, West Bay City, Mount Clemens, Marine City, Menominee and Hilisfield, making a total of seventeen factories in the state.

The industry has grown to such proportions that the sugar companies pay to the farmers an average of more than $10,000,000 annually for their crop of beets. They also pay to the railroads of the state more than $2,000,000 in freight charges. For the operation of these plants, about 250,000 tons of coal is required yearly, most of which is mined in the state. One hundred thousand tons of limestone is also used, all of which is quarried in Michigan.

The seventeen factories turn out 300,000,000 pounds of sugar annually, requiring 480,000 barrels made in Michigan from Michigan material. Fully 50,000 farmers are engaged in raising the beets which these factories consume. The "season" for the sugar factories is only as long as is required to consume the year's crop of beets, which is about 100 days on the average, or three and a half months. During this time the factories run twenty-four hours a day, employing altogether more than 8,000 men.

Most of the output of the Michigan factories is marketed in Michigan, Ohio, Indiana and part of Illinois, although last year some of it went to France as part of the supplies sent by the American Food Administration.

Rail Freight Increases And the Cost of Living

(Continued from Page 10)

Government, to be supported by taxation on even a heavier scale than heretofore.

Third, new spirit has been given to the railroad managers and working forces. The managers feel the ground firmer under their feet. They no longer regard as hopeless a return to the old time operating efficiency. The employes, seeing a real earning basis for their generous wages, are less restive and more inclined to heed the pleas of the officers for co-operation in the restoration of efficiency.

These factors, together with the increased facilities which revived purchasing power and credit will enable us to procure, will—not at once, but in time—permit a resumption of the free and unrestricted movement of traffic the country over, and ultimately, I hope, a complete revival of the old high standards of American railroad service.

Continued help and co-operation on the part of shippers and receivers of freight is just as important as efforts by the railroad working forces themselves.

The United States Chamber of Commerce recently summarized in striking figures what the patrons of the railroads could accomplish in the way of further increasing the transportation capacity of the country. Without going into details, I will merely say that this summary showed that heavier loads per car, together with prompter loading and unloading of cars—all within the limits of reasonable practicability—would add the equivalent of 535,000 freight cars to the nation's available supply.

That number of cars, bought by the railroads at the prevailing prices, would cost more than $1,600,000,000. We would certainly have to pay at least 6 per cent for the money, and the high interest charge would have to be borne by the public in the form of increased rates.

In asking for additional efforts on the part of our patrons, I hope I will not be accused of having forgotten so soon what shippers and consignees did so willingly and effectively during the war, and continued to do after the war traffic had entirely ceased. I merely wish to emphasize the fact that these are the days in which co-operation all around is not merely one of the things that make life pleasant—it is the sternest kind of an economic necessity to the well being and safety of this country of ours.

The kind of co-operation I mean, so far as the railroads are concerned, embraces their managers, their working forces and their patrons. If we all pull together and make the best of what we have, I am sure we shall be able to utilize the present railroad facilities as to meet successfully the country's needs until those facilities can be enlarged and improved. For myself, I have every hope and confidence that these results will be achieved.

WATER-SEWER SURVEY DEMANDED

State Sanitary Engineer W. D. Rich has notified the municipal authorities of Traverse City that unless a complete survey, with plans and specifications, of the city water distribution and sewer system is filed with the state board of health by January 21, the state will begin proceedings against the city officials.

FOOTE & JENKS REPORT GOOD YEAR

Salesmen of the Foote & Jenks organization, perfume and extract manufacturer, gathered in Jackson recently for a conference in connection with the close of the year's business. The reports show the concern to have made its best record for business in 1920, and the concensus of opinion among the salesmen was that the year 1921 would show even larger results.

ALMA FIRE LOSSES NEGLIGIBLE

Joseph F. Sattor, chief of the Alma fire department, claims the smallest loss for his department of any department in the country in a city as large as Alma for the first six months of the fiscal year. The department was called to 19 fires, the loss being $160. The asserted valuation of the property was $150,000, making a fire loss of about one-tenth of 1 per cent.

Without Consulting the Prospective Corpse

(Continued from Page 6)

the shows, the motor car business will open with a crack. No question about it."

"I do not believe that the Detroit territory has ever been adequately supplied with motor cars, and until the point of saturation has been reached, there will be no reason for pessimism. In times like these, good management and a revision of sales methods are called for. After being in a buyers' market so long, it is only natural that a reaction should throw the business off balance temporarily. But the situation has improved within the last week or so and will continue to improve. Real salesmanship is called for and the order takers of the past either must learn how to sell or get out of the business."

The above view of the situation was offered by C. H. Potts, of the Potts Motor Sales Company, Haynes dealer. It is the view shared by the automotive retail trade as a whole. From now on the motor car selling business will experience competition never known before. The best men, the best organizations and the best cars will survive.

There is no use trying to emphasize the hole in the doughnut when men talk as they do along automobile row. H. H. Stuart, manager of the Detroit Auto Dealers' Association, treats the rumors with the contempt deserved when he says:

"There have been a lot of stories floating about. There always are in times like these, but most of them have lived their short lives and passed out. A few weak sisters got panicky and they somehow enjoy the misery they get from hearing and repeating wild rumors. Times have not been as rosy as we would like to have them, but 1920 was expected, but it came quicker than expected. Some were prepared, others were not.

"We can say for the automobile business in Detroit that it is too well established and there is too much money in and around Detroit to cause well-schooled business men to get scared over a temporary depression. I don't suppose the retail business could go on forever with the situation as it has been, but the men who built right in the first place, and thoroughly understand the motor car business, are not losing sleep worrying about the future.

"With a renewal of industrial and business activity in other parts of the country, evidence of which is developing daily, watch Detroit come back to its new normal. Those who haven't yet abandoned the idea that a pre-war normal is coming, are only delaying business. We must adjust our mental vision to a new range and our expectations to new levels to which past criterions will bear only the relationship of contrast."

As a sort of antidote for the poison of melancholy, these figures from the Motor World should be effective. Twenty years ago there had been manufactured in this country the enormous quantity of 3,700 motor cars. In 1920 the production of American cars and trucks was 2,230,000, although the industry had set a mark of 2,500,000. Out of the vast number of cars built, those unsold represent just one month's production. This being true, then there are available for the market only a month's supply of cars, and most of the motor plants are closed or working on short schedule.

The current unsupplied demand is estimated at 2,500,000 cars. It has been said that when there are 12,000,000 motor cars in use (approximately one car to every nine persons) in this country, then it will be time enough to consider curtailment. The average life of a car is placed at 50,000 miles, or five years' service. We might be surprised if we knew how few cars are allowed to live that long.

What the next five years probably will see will be the elimination of some cars from the field and consolidation of other companies, with an attendant concentration in production, a higher grade of salesmanship and a more general use of the greatest vehicle the world ever has known.

New Publications

C-H SPACE HEATERS

Among the new publications on space heaters, being distributed by the Cutler-Hammer Manufacturing Company, Milwaukee and New York, are a 4-page, 8½x11 leaflet and an 8-page envelope-size folder. Both of these publications are illustrated with views of C-H Space Heaters installed in airplane hangars, crane cabs, valve houses, etc., and give lists of uses to which these heaters have been put. The heaters are described, and tables aid the customer in choosing the approximate number required for any particular installation. C-H Space Heaters are standardized flat heaters of 500-watt ratings and may be connected to direct or alternating current light or power circuits in the same manner as adding electric lamps. The 8½x11 leaflet is known as Publication 880 and the envelope folder as Publication 874.

"YOUR INCOME TAX"

James Barr & Company, certified public accountants, Detroit, New York and Syracuse, have issued a booklet entitled: "Your Income Tax," in which this rather complicated subject is analyzed and explained in the plainest possible language, devoid of technicalities and with the hope that it will be of use to the "perplexed business man." Examples of computing the income tax; error in method of computing depreciation; how partnerships are taxed; corporations; computation under sections 301 and 302, and a number of charts or tables are some of the enlightening features taken up in the booklet, which may be obtained by writing to the company's offices in the Penobscot building, Detroit.

AGRICULTURAL STAPLES AND THE TARIFF

The United States Tariff Commission has just issued a report entitled "Agricultural Staples and the Tariff," which treats in detail of production, channels of trade, character of foreign competition, [illegible] of customs tariffs in six of the [illegible] an staples—wheat, oats, flax[illegible] and potatoes.

The r[illegible]ch in the receipts of foreign foodstuffs has attracted widespread comment and has been the cause of tariff agitation by farmers and allied interests. The subject has been injected into the current political situation, and this report is therefore particularly timely.

Especial attention is given to a study of conditions in Canada. In the introductory chapter the Tariff Commission's report compares agricultural conditions and development in the two countries and discusses briefly the general character of their agricultural trade. The body of the report consists of a series of studies dealing with the several products in question. Each of these studies is prefaced by a summary and a statement of conclusions.

Copies of this report may be obtained from the Superintendent of Documents, Government Printing Office, Washington, at 35 cents each.

TITLE COMPANY TAKEN OVER

The Taylor Title Company, the oldest and for some time past, the only abstract office in Kalamazoo, went out of existence on New Year's day, and has been succeeded by the Title Bond & Mortgage Company, an organization made up mainly of Kalamazoo men. The change was occasioned by the election of John L. Hollander, president of the company, to the probate judgeship. Albert Todd is president of the Title Bond & Mortgage Company.

FURNITURE MAKERS TO ADVERTISE

At the semi-annual meeting of the Retail Furniture Association of the United States, in Chicago, this week, a plan for a national advertising campaign to promote the sale of furniture was presented.

It is proposed to create a fund of $250,000, half of which would be subscribed by manufacturers and half by retailers, by placing a tax on one-tenth of 1 per cent on total sales.

The plan was worked out by the joint committee of the National Council of Furniture Associations and of the retailers' Association, and follows meetings held in Grand Rapids last year.

LANSING C. OF C. MEETING

The annual meeting of the Lansing Chamber of Commerce will be held January 18. A program is being arranged.

Trailer Interchangeability Feature of the New Trucks

New truck models for 1921 to be put out by a number of manufacturers embody changes which will adapt the trucks for drawing trailers, says an announcement from the Trailer Manufacturers' Association of America. These changes include additional speed changes—four, five, or six—heavier rear axle construction, coupling devices for trailers and increased braking surfaces.

"This is a recognition by the manufacturers of the growing public demand for trucks that can pull trailers satisfactorily and give the maximum service," says the statement. "It is highly desirable, while making these changes, that the truck manufacturers adopt standardized trailer hitches as regular equipment, so that any make of trailer can be used with any make of truck. The Society of Automotive Engineers last year approved the recommendations of a joint committee of its truck standards division and the Trailer Manufacturers' Association for standardized trailer hitches. Large corporations operating fleets of more than one make or truck often find, after buying a number of trailers, that the trailers cannot be used with all of the trucks without making expensive changes in some of the couplings.

"Interchangeability of trucks and trailers is of growing importance to motor express operators, as indicated by the following case: An operator over a route of more than 100 miles has been figuring on buying trailers to be used like box cars behind his trucks. In case the goods in the trailer were consigned to points 75 to 125 miles beyond the end of his own route, he planned to turn such trailers over to operators of connecting or adjoining routes to be hauled by their trucks the remaining distance. It was found, however, that the coupler bars on the trailers would hitch on to only about one-third of the pintle hooks on the trucks operated by any of the companies. There is no doubt that if the situation is remedied there will be a considerable development along the foregoing lines, trailers being transferred from one motor express line to another, just as freight cars are switched from one railroad to another for long hauls."

RED CROWN Gasoline is made especially for automobiles. It will deliver all the power your engine is capable of developing. It starts quickly, it accelerates smoothly, it will run your car at the least cost per mile, and it is easily procurable everywhere you go.

Standard Oil Company (Indiana) Chicago, Ill.

Foreign Traders Meet in May

Samuel Mather, Honorary Chairman of Committee, Making Arrangements for Cleveland Convention

REALIZING probably more keenly than ever before the imperative necessity of permanent foreign trade as a stabilizer of American production, the country's exporters doubtless will attend in exceptional numbers the eighth annual convention of the National Foreign Trade Council, scheduled for Cleveland, next May.

The National Foreign Trade Council is the country's foremost and most influential factor in furthering and fostering foreign trade extension. Primarily its efforts are directed toward obtaining more definite and aggressive co-ordination of the varied overseas commercial activities and to re-enforce them with the decisive co-operation of the various governmental agencies. Incidentally, it is non-partisan and non-political.

The annual conventions are much in the nature of an annual review of the Council's activities in investigating and advising on all phases and movements of national importance that make for an increased volume in the nation's export business. They are really concentrated training schools in foreign trade relations and conditions, wherein the attendance is treated to the experiences and best advice of the men who stand highest in the export field.

Under the stimulus of a war-made foreign demand, American exports increased from less than two and one-half billions in 1913, to more than eight billions in 1920. The remarkable period of activity which attended this condition fully awoke the American manufacturer to the tremendous possibilities of a well developed and permanent foreign trade. But out of it all grew no really definite and lasting foreign connections for the great majority of those who profited chiefly from munition making. It is this class of manufacturer who should be most keenly interested in the problems that will come up for discussion before the next National Foreign Trade Council convention.

The Cleveland convention committee of 50 is officered as follows: Samuel Mather, Pickands, Mather & Company, honorary chairman; E. R. Fancher, governor of the Federal Reserve Bank, Myron T. Herrick, president the Society for Savings, Henry Howard, the Grasselli Chemical Company, William P. Palmer, president the American Steel & Wire Company, and Ambrose Swasey, president of the Warner & Swasey Company, honorary vice-chairmen, and H. P. Seymour, Columbian Hardware Company, Executive Chairman.

Members of the National Foreign Trade Council in the Middle West are: R. M. Calkins, vice-president, Chicago, Milwaukee & St. Paul Railway; Cyrus H. McCormick, International Harvester Company; Frank O. Wetmore, president, First National Bank, and Thomas E. Wilson, president, Wilson & Company, Chicago; Samuel Mather, Pickands, Mather & Company, and Henry Howard, Grasselli Chemical Company, Cleveland; Charles A. Hinsch, president, Fifth-Third National Bank, and William Cooper Procter, the Procter & Gamble Company, Cincinnati; John Crosby, Washburn-Crosby Company, Minneapolis; F. G. Crowell, Hall-Baker Grain Company, Kansas City; J. Walter Drake, chairman of the Board, Hupp Motor Car Corporation, Detroit; J. Rogers Flannery, president, Vanadium Steel Company, Pittsburgh; H. G. Herget, president, Pekin Cooperage Company, Pekin, Ill.; Louis W. Hill, chairman of the board, Great Northern Railway; St. Paul; Edward N. Hurley, Wheaton, Ill., and John N. Willys, president, Willys-Overland Company, Toledo.

CRUCIBLE STEEL BRANCH MOVES

The purchase of the property of Young Brothers, 1437-1459 Franklin street, Detroit, will enable the local branch of the Crucible Steel Crucible, 1326 Woodbridge street east, to have twice its present warehouse space necessary in the proper handling of a greatly increased business. The removal from the old to new quarters will be accomplished by February 1, after which all business will be conducted from the new address. **The company,** located at Dunkirk, N. Y., manufactures high speed tool steel.

FLINT JUNIORS HELP THE NEEDY

Members of the Junior Chamber of Commerce, Flint, provided Christmas dinners for more than 100 deserving families in Flint, Christmas day. The campaign brought together 90 boys who provided baskets containing the following: Roast, potatoes, beans, butter, sugar, coffee, fruit, milk, bread, vegetables, desert, nuts, candy, also the following articles: Two pair of boy's trousers, five dresses, three pairs of rubbers, 11 pairs of shoes, 13 pairs of stockings, nine pairs of gloves, two sleds, 12 dolls, 32 books and 78 other kinds of toys. The boys delivered the baskets.

FURNITURE SHOW ATTENDANCE

According to the records of the Grand Rapids January Furniture Show committee, there were 605 buyers at the show during the first week, a normal attendance.

AND
FINANCIAL RECORD

An Inventory Program for Business

How is Accumulation of Goods to Be Remedied? What Price Policy is to Govern the Valuation?

TWO of the difficulties, if I may single them out, which are now confronting business men are: First, inventories in excess of present requirements; second, difficulty of determining the market value of those inventories for the purpose of closing the books and ascertaining taxable income.

As to the first circumstance, namely, the accumulation of inventories in excess of present requirements, it hardly seems necessary or, indeed, fitting for me as a layman to comment to any extent. Cost accountants know much better than I why there are excessive inventories in plants or in stores, if such is the fact. It is due, however, to a variety of circumstances principally arising out of conditions created by the war. In many lines of business an artificial demand was created by the order, purchase and resale of commodities such as sugar, coffee and the like. Then again, the apparently enormous and unlimited demand for commodities and materials of all kinds existing up to a comparatively short time ago probably led prospective purchasers of those commodities to place orders in excess of their reasonable requirements because they expected to be able to secure only a part of what they had ordered. Doubtless the crowded conditions of the factories and the congestion on the railways made it necessary to place orders far in advance and to accept whatever could be delivered, undoubtedly with the effect of ultimately increasing the inventory.

Buyers' Strike the Chief Factor

Most of all, I suppose, the cause of the excessive inventories is the exceedingly sudden and severe reduction in the demand for merchandise on the part of consumers. Manufacturing is a continuous process. Into the mill flows the material which, by the application of labor and expense, is converted into product which goes out of the factory and to the ultimate consumer or user. If you dam any part of this stream, of course it will back up immediately, and that is just what has been done. I know of no remedy except just what you would apply in the case of the stream that has become checked, namely, that you would try to control tributaries entering into that stream above the dam. In this case the tributaries are labor, material and expense. The only way to prevent the volume from becoming larger is to control or reduce these elements. That, as you know, is what is being done. It is a severe remedy, but necessary.

The next problem, and obviously the larger one, is to improve the basic condition of the country so that the purchasing consumption or use of merchandise or products may be increased or brought back to normal. You undoubtedly read the opinion of financiers, business men, exporters, statesmen and others, and you realize that it is not simply a matter which involves this country, but that it is one of world-wide complexity. To a considerable extent it may be a state of mind, and probably is. We know the burden of Mr. Harding's exhortations to get back to normal. We all subscribe to this, no matter what our political faith may be. That is what we shall have to do in order to solve the problem; a normal manner of living, a normal manner of working or, let us say, a better than normal in the way of increased efficiency and attention to work, a normal manner of purchasing, a normal manner of manufacturing, a normal manner of buying; and when all these kinks due to abnormal conditions have been worked out, we shall find business flowing along at an accelerated pace, the problems of excessive inventories remaining only as a bad dream.

Then there is the other exceedingly serious problem of inventory valuations, that is, at what price should the materials and product be valued in order that they may be stated low enough so as to avoid any loss when they are liquidated; and on the other hand, high enough so that the Government may receive its just payment of taxes, if any such taxes are bound to be due.

I like to consider this matter as an accounting problem and not a tax problem. Taxes are supposed to be paid only on income and profits, and in the last analysis you cannot state income and profits correctly unless you apply sound accounting principles and practices.

It is obvious that if a manufacturer sells all that he has made, or, in other words, cleans up entirely, he knows exactly what he has made or lost, assuming that his outstanding accounts are all collectable.

It is equally obvious that such conditions seldom or ever exist. A manufacturer cannot clean up entirely; he is engaged in a continuous process. A dealer cannot sell out entirely; he must constantly replenish his stock. Therefore there is always something left over which has to be valued before he can ascertain what profit or loss has accrued on that part of the product which has been sold.

If there is sufficient volume of sales orders on hand, or if business conditions indicate that such orders are likely to be received, then no difficulty is encountered in pricing the inventory.

If there are any such orders on hand or in sight, and if there is every indication that when they are received they must be taken at a lower figure, and if it is evident that the materials on hand could now be replaced at lower cost, then of course the inventory must not be priced in the same manner as when conditions are normal, otherwise the manufacturer or dealer is simply deluding himself as to the amount of profit he will ultimately realize from his transactions of the year.

What would be done as far as the statement is concerned under such circumstances? Would not the inventory be written down to what it is actually worth? Is there any correct accounting procedure which would permit of anything else being done? Would the accountant be justified in certifying the statement to the management, the stockholders, owners or the bankers if such a procedure had not been followed?

Correct Accounting Necessary

What I have said regarding this method of stating profits is elementary. I state it now only for the purpose of emphasizing the point that the valuation of inventories should be done in accordance with correct accounting procedure.

There have been numerous regulations and explanations, and advice has been given here, there and everywhere as to what may or may not be done, but these tend only to confuse the issue. In the last analysis I do not believe that anything which conflicts with sound accounting practice will stand.

Cost or market, whichever is lower, is a sound accounting practice. I realize that it is easy to make this general statement, but very difficult in many instances to determine what the real market value may be. If it happens that sales have been made in considerable volume and that orders can be placed sufficient to meet the normal requirements, then it would seem that a market value in that particular case has been established. In many lines, however, there has been no real market. There is a nominal bid and offered price, but virtually nobody bids; consequently no one sells. Ordinarily in valuing collaterals in a bank examination we would use the bid price as representing most nearly the real value. Just now, however, bid and offered prices, in many instances, do not indicate a real market,

By WILLIAM M. LYBRAND
President, National Association of Cost Accountants

[Extract from an address delivered Wednesday, January 12, at a meeting of the Detroit Chapter, National Association of Cost Accountants. Mr. Lybrand is a member of the firm of Lybrand, Ross Bros. & Montgomery, New York and Detroit.]

Digitized by Google

although it would seem that they at least represent the extremes.

If the market is so uncertain as that, I do not see what can be done except to get the best and fullest information possible based on bids, offers, pre-war prices, such sales as have been made, probable demand, quantity available and any other factors that enter into the determination of market value. If there is a very wide spread between the bid and offered price, and you feel that one is too low, the other too high to represent a normal figure at which normal quantities could be bought or sold, then you will simply have to use your best judgment as to the price you place on such material, merchandise or parts of that character as you may have.

If a reduction in selling price has been determined upon, then it would seem that the price on finished product would be justified which would at least let the owners of that product out whole—that is, without a loss—and that work in process entering into the product ought to be valued in the same manner. Expedients adopted for the purpose of attempting to establish a market value are to be avoided. A straightforward statement based on the best judgment of the taxpayer and one which he is prepared to stand behind and justify is the kind of a statement to present.

I want to give a memorandum which condenses in simple form some of the rules for valuing inventories.

1. Raw materials are to be valued at cost or market, whichever is lower. This is the general rule accepted for accounting and taxation purposes. The modifying factors are the physical conditions of the materials, their value in use and the present condition of the market for the particular materials.

2. If materials are damaged, but if it is possible to put them in a condition where they could be used, the value is cost or market price of the quantity after it is repaired after putting them in a condition for use, less the cost of restoring them to this condition.

3. Where, through changes in design, manufacturing processes or other reasons, materials may not be used for standard production, a free market does not exist and value is to be determined by a continuous run of selling prices, or the standard practice followed in the particular industry for pricing such items, such as the custom followed in the automobile industry in pricing replacement parts for old models.

4. Where there is not a free market, it would obviously not be possible to establish a market price in the usual way, and in such event an inventory value may be established hy a bona fide continuous course of selling below cost.

5. In cases where there is no market and no continuous course of selling below cost, the best opinion of the market experts in the particular material may be used as a basis to fix values.

6. The cost of materials in process of manufacture is made up of three items: Labor, materials and burden.

7. The labor in work in process should be valued at the market or cost price of labor, whichever is lower. If at the time the work was performed, labor cost more than it does at the time of taking the inventory, the last and lowest cost should be used.

8. Materials included in work in process should be valued in the same way and the same methods as that used for raw materials in stores.

9. Burden includes a variety of items such as indirect labor, lubricating oils, fuel, repairs to machinery, etc.

10. The proportionate quantity of burden items including in work in process at inventory times should be valued at the market price if it is less than cost. As a practical matter it might be difficult to do this, but in many instances it probably would result in considerable reduction in inventory values and consequently in taxable income.

11. Only the normal rate of burden should be used in valuing at reproduction cost. Unabsorbed burden is of course a charge to profit and loss.

12. Materials thrown back on the hands of the manufacturer as a result of cancellation of contracts should receive careful scrutiny. The value of this would depend on the conditions in the particular case. In some instances it might be worth the full reproduction cost when conditions return to normal, while in other cases, due to various causes, it might have only salvage value.

Brakes Go on Truck Over-Sales

Directors of National Cartage Organization Discuss Situation Caused by Over-Enthusiasm in the Business

RIDING to wealth on the seat of a motor truck is one of the numerous "Arabian Nights Entertainments" of modern business enterprise. That is, it was "Ponzi" when the economic boomerang scored a hullseye. Motor trucks were sold by a simple twist of a fountain pen and bought with still shorter abandon. Everybody who ever read or heard of "Ishmael Up From the Depths" and some who had not went after Rockefeller's title with a motor truck, under the seat of which was a large basket to hold the day's winnings.

There were salesmen who gave free with every truck sold a contract for a haulage job, but after the contract had expired the new truck magnate was supposed to hunt his own jobs. Motor trucks were thick as fleas." Even a waitress in a Detroit restaurant invested her tips in a motor truck and hired a friend to operate it on a commission.

It was dangerous to hesitate before a building or excavation job because nine chances out of 10, a dapper gentleman would step up to you, tap you on the shoulder and suggest that you buy a motor truck and get rich. More than one truck was sold in this way, if reports are to be believed. Who can blame the salesman if he was honest in his belief that motor vehicles should be sold like bound volumes of the "Lives of Great Men?" Nor can we blame the men who bought because they succumbed to the lure of the "Mississippi Bubble" in motordom.

Just remember that the motor truck has accomplished great things. It has saved lives, defeated time, helped with a war and saved beleagured cities. The motor truck is greater than the railroad train was half a century ago, but like the railroad was years ago, it has been over-played. Sitting on one side of the game is the truck manufacturer and his adjunct, the selling organization. On the other side is the present and future buyer. The motor truck industry, from plant to salesroom, will solve its own problems, but how about the buyer?

Present conditions of the cartage business indicate he needs a pilot, and the National Team and Motor Truck Owners' Association is organized and duly licensed to do his piloting.

Former presidents and a number of directors of this association met in Detroit for a week for a general conference on the cartage situation and to make plans for the guidance of the business through the approaching era of revivified business and industry. It was the statement made by the conference to the effect that the over-equipping and the overloading of the business with ruinous competition was largely to blame for the present depression and numerous failures in the business, that prompted the opening paragraphs of this review of the deliberations.

The national association is many years older than the truck industry. It flourished when good old Dobbin was the only type of power used in the cartage business and when all truck owners wore leather aprons and carried books. Since the motor truck has entered the business, the Association has been broadened to include motor power as well as horse-power.

It is alive to the new problems in the cartage business, and proposes, through educational programs and co-operation, to endeavor to stabilize this enterprise by casting its influence in every practical way, that of equipment to cost accounting and legislation.

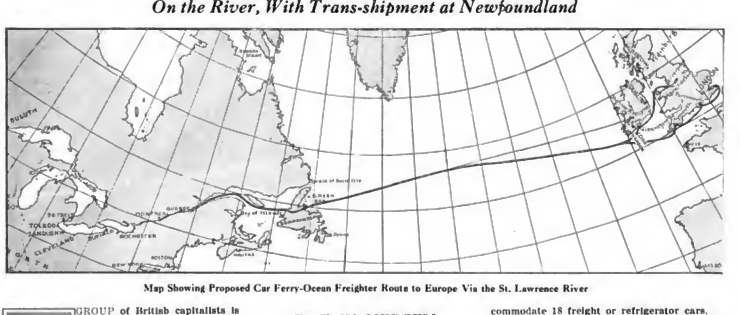
Eighteen Cities Represented

Eighteen of the largest cities in the country are represented in the national association by branch organizations of cartage men, similar in character to the Detroit Transportation Association. Detroit leads all these and every other city in motor equipment, the Association's report shows. Detroit is declared to be 95 per cent motor-equipped, while the nearest competing city is not more than 60 per cent so equipped. After comparing notes, the conference decided that in Detroit and elsewhere both over-equipment and improper equipment had seriously affected the business, and that the present general depression in business merely brought these conditions into prominence.

It was the opinion of the conference members that the Association should immediately advise more careful buying and urge discharge of equipment wherever possible, rather than the purchase of additional trucks, motor or horse-drawn, where temporary business booms tempted cartage men to enlarge their facilities. F. J. Abel, Buffalo, president of the Association, expressed it in this manner:

"There has been over-buying, not only in motor but in horse-drawn equipment. A lot of business failing to one man has moved him to over-buy, while perhaps a fellow cartage man, who did not have an excess of business, could have helped him out. For the time being, the profits for the man with the rush of business would have been reduced, but in the end he would have been better off, for in a time like the present he would have been saved the consequences of an excess of unemployed equipment. It is unwise buying that has thrown trucks back upon the dealers and floored the production departments. That result has been just as disastrous to the manufacturers and dealers as it has been to the cartage men."

W. J. McDevitt, Cincinnati, treasurer of the Association, declared that the popularity of the horse for cartage work was being revived rapidly, and the conference agreed that his statement was true. Unwise buying again.



"The difference between selling a truck and equipping a cartage man's business is success," Mr. McDevitt said. "It is easy to sell a truck to a man who does not know the business he is entering, or who has heretofore used

(*Continued on Page 36*)

Detroit to Europe Via the St. Lawrence by 1923

British Syndicate Proposes Using Freight Ferries On the River, With Trans-shipment at Newfoundland

Map Showing Proposed Car Ferry-Ocean Freighter Route to Europe Via the St. Lawrence River

A GROUP of British capitalists is proposing to provide by May, 1923, facilities whereby the export output of manufacturing plants in the Great Lakes states—as well as those throughout the whole Middle West—may be transported from Detroit to Liverpool in 15 days by way of the St. Lawrence river and Newfoundland, with only one trans-shipment for perishables and two for bulk freight of a more durable character, and to be duty-free in and out of Newfoundland. The proposition is being laid before the manufacturers and exporters of this and surrounding states by the Great Lakes-Newfoundland Trans-Atlantic Route Development Company, 206 Owen building, Detroit, American representative of the Newfoundland Railway & Train Ferry Syndicate, Ltd., of which H. C. Thomson, Salisbury House, London, England, is managing director.

Before going into detail it should be emphasized here that this proposed route is not a substitute for the Great Lakes-St. Lawrence deep waterway to the ocean, nor a proposition intended to detract attention from the project which would enable ocean-going ships to navigate the waters of the St. Lawrence and dock in or near Detroit. There is no substitute for such direct water communication with the markets of the world.

It appears that what the St. Lawrence-Newfoundland route really amounts to is a plan to make Newfoundland a world port and a desirable location for plants of American manufacturers who crave the privilege of manufacturing and exporting products to Europe without paying duties.

If the promoters are successful with their program, the project will be an important economic asset, a potent factor in putting Michigan products into Europe on a fairly equitable basis. The Detroit representatives of the British interests, identity of which is withheld, are C. D. Hoban, M. F. Owens, M. J. Owens and T. D. Nevin, respectively, president, vice-president, treasurer and secretary of the Great Lakes-Newfoundland Trans-Atlantic Route Development Company. The British end of the project is represented by a banking house in New York, the identity of which also is withheld.

By F. W. HERSEY

Naturally, the first inference is that there will be stock to be sold. Mr. Hoban says that his company has been formed and assigned to accomplish but one purpose—the development of freight business for the new route; in other words, it has the characteristics of a freight agency. Mr. Hoban says his company is not selling and will not sell stock, that being a part of the proposition handled in New York and London.

The plan of operation provides for the establishment of a direct route from Detroit to Liverpool and Manchester, England, and Cork, Ireland, the route to follow the St. Lawrence river to Newfoundland, across the island of Newfoundland by rail, with re-shipment to ocean vessels for the ports named. The running time is 15 days, apportioned as follows: Detroit to Newfoundland, 5½ days; time for crossing the island, loading and re-loading, 2½ days; Newfoundland to Liverpool, Manchester or Cork, seven days. The route would be open seven months of the year.

The Boats to Be Provided

The transportation facilities to be provided would consist of six combination bulk freight-car ferries for river travel from Detroit, the western terminal, to Newfoundland, one or two standard gauge railways crossing Newfoundland, and four 8,000-ton ocean ships. The car ferries would be 2,500 tons each, 265 feet long, 45 feet beam and 14 feet draft, small enough by a considerable margin to pass through the St. Lawrence canals. They would be powered with Diesel engines, thus reducing fuel space and making them clean ships for preferred freight. The hold capacity would be 1,800 tons of bulk freight and the deck capacity would accommodate 18 freight or refrigerator cars.

The St. Lawrence empties into the Gulf of St. Lawrence, in which the position of the island of Newfoundland has caused it to be called "The Gate Keeper." The Bay of Islands on the western coast of the island has been selected as the harbor for the car ferries. From this point to Green Bay, on the east side, selected as the port for the ocean ships, the overland distance is 92 miles as surveyed for the railroad, which would cross the neck of the Newfoundland peninsula. There is at present a railroad on the island, a narrow-gauge line following the circuitous route, and of no value whatever to the British project.

Consequently the promoting company would build its own railroad of the standard gauge type from the Bay of Islands to Green Bay, with the necessary freight yards and warehouses at each terminal. At both terminals docks would have to be constructed, with facilities for the transfer of freight and refrigerator cars from the ferries to the railroad. It is estimated that the running time between Bay of Islands and Green Bay would approximate four hours. Now the question naturally arises, why not send the car ferries through the straits of Belle Isle and avoid the land trip as well as the re-loading necessary for bulk freight?

The reason given is the frequency of heavy fogs, which would defeat the main object desired by establishing this route—that of saving time. The problem of fogs in this locality was investigated thoroughly by the company in cooperation with the United States Department of Agriculture, and it was found that an attempt to send the car ferries into Green Bay by way of the straits would occasion frequent delays, which would greatly increase the 15-day schedule believed to be easily adhered to with the rail connection.

The project of making Newfoundland a world port and seeking freight patronage along the St. Lawrence river was conceived, the writer is told, 14 years ago, but it was not until 11 years ago that the British interests began making definite plans for its development. The

Digitized by Google

Newfoundland Railway & Train Ferry Syndicate, Ltd., obtained charters for two railways across Newfoundland. One was to cross the isthmus of Avalon from Rantem, on Trinity Bay, to Little's Southern Harbor, Placentia Bay. The other was to traverse the island from Humbermouth, Bay of Islands, to Southwest Arm, Green Bay, with a branch line to White Bay.

The war put a stop to plans, and it was necessary to obtain a renewal of the charters, with the provision that they should take effect immediately the company began the construction work. Mr. Owens says it was then the purpose of the company to develop the fish business, the belief being that there was a great market for deep sea fish in the States, once direct and rapid transportation could be obtained.

When the larger project took form, the ferry syndicate went to the Newfoundland legislature and obtained authority to proceed with the railway project and also got an exemption for 20 years from all port, pilotage and harbor dues, and from duties on freight, express and baggage forever.

Without these exemptions there would have been a doubt as to the profitableness of the plan. Mr. Owens points out that to be successful the transportation company must be in a position to compete with railroads at present and the ocean shipping of the future when the Great Lakes-St. Lawrence route is opened. Competition necessarily involves rates as low or lower than can be offered by present rail and ship combinations, and service quicker and less expensive than possible under present conditions. Exemption of dues and tariffs removes an obstacle to advantageous rate making.

Another advantage mentioned is the elimination of interlocking interests operating independently so far as service is concerned. The British group, or Anglo-American group, which-ever it may be, that would operate this boat line would own all the equipment and be wholly responsible for the character of its service. Where you have a railroad company on one hand and a shipping company on the other, with brokers in between, the frequent lack of service co-operation between the trimsverate does not operate to the welfare of the shipper.

In the case of this company, should it become all that is promised, the failure of the railway to perform well would make the ship lines useless; the failure of the ships would make the railway a costly experiment. Whether or not the English promoters have other interests to be developed, of which the ship and rail lines are but incidental, the fact remains that freight patronage from Michigan will be forthcoming only when the rates and the service are sup. rior in advantage to those offered by existing facilities.

Mr. Holman told the writer that he first became interested in the project while in Europe drumming up business for butter, cheese and eggs, particularly eggs. As a shipper of shell eggs he believed England offered a prime market, especially as Danish and Irish eggs were

Doing Away With the "Doodads"

Two Speakers Before Society of Automotive Engineers Bespeak Conservatism in the Design of Motor Cars

WE HAVE HAD experimentation, ostentation and exploitation in the motor car industry. After he has whipped his motor into shape, worked out the chassis design and built up the body structure, the designing engineer in his various capacities has gone almost "the limit" in fastidiousness and comfort by adding to a standard car every known "doodad," device and luxury discovered by the inventive mind.

Now comes the reaction to conservatism. There is to be frugality in body models and comparative parsimony in equipment—that is, a forecast of such a policy comes to us from the deliberations of the Society of Automotive Engineers during the week of the National Automobile Show in New York.

Two authorities, one representing the automotive industry, and the other falling from the ranks of select buyers, expressed views on body design and simplicity in construction.

George J. Mercer, consulting body engineer of the Saxon Motor Car Corporation, Detroit, discussed body design before the body engineering session of the Society, while R. E. M. Cowie, vice-president of the American Railway Express Company, speaking at the society's annual dinner, departed from his general subject of aeronautics long enough to express a few ideas about simplicity in motor car construction and equipment in its relation to economical production.

"The number of different models that will prevail during the coming season is less than in past years," said Mr. Mercer. "For example, a few seasons ago one manufacturer listed 14 body styles that were in regular production. The greatest number of models listed by one manufacturer during the last year was eight; the majority listed four, and this latter number probably will be the number of different models made by most manufacturers in the coming period.

"The body types which will prevail during the coming year will be confined to the five-passenger touring car, two-passenger runabout, five-passenger sedan and four-passenger coupe, with seven-passenger touring cars and seven-passenger sedans in limited numbers.

"The sporting type touring body usually is of four-passenger design. It is intended to appeal to the younger element, who want low, racy lines that indicate speed. This sporting model is an offshoot from the standard touring car design, but manufacturers usually both give them distinctive names and list them as individual models. However, the greater olume of business is still with the larger or five-passenger body.

"There have always been runabout users who wanted a small body with seat room for more than normal passenger capacity. The runabout logically has a two-passenger body, and when so made there is a certain definiteness in its design. The desire for more seat room brought out combination models in the past that have been short-lived, but those who require seat room for three or four passengers are best served by a close-coupled miniature type four-door touring body. The runabout will hold its place as a necessary model, but it has been decreasing in numbers during the last two years. The five-passenger body seems to have been a necessary addition for both the larger and smaller body types. The runabout as made by the different manufacturers today is more uniform than formerly and has fewer freakish characteristics. When equipped with the all-season top, it is a sensible car for doctors and professional men.

"The five-passenger sedan with four doors has undergone many changes within the year. This has been the substitution of the straight for the slanting front, which simplifies manufacture and is more practical for small cars. The four-door sedan as we have it today comes nearer to meeting with general approval than any body design ever introduced. It has superseded all other forms of closed bodies for general use, except the coupe, which finds favor because it is a miniature of the four-door sedan.

"In body construction the soft roof is used extensively. This roof is formed of water proof material drawn over padded wooden strips, and has been one means of keeping costs down during a period of high prices.

"The favored coupe has a four-passenger body. It has a compactness that makes it suitable for both shopping and business, and as the fourth seat is of the disappearing type, a comfortable entrance is provided to any seat. In addition, accessible carrying space both inside and at the rear of the body is provided.

"The straight line with angular corners is giving way to moderately rounded surfaces, but the straight effect is stimulated.

"Other features that increase the common sense usefulness of the open body are inside and outside door handles; the use of rear top rest irons that are taken off when not required; a superior quality of springs in the seat cushions; lighter hoods and radiators that give the appearance of vigorous motive power, and by their comparison in height with the body side, help to make it look lower. There seems to be a general tendency to use cowl lamps, although the use of the sun visor has not been as general as it promised to be.

"The quarter window on closed models has been made of less conventional size and irregular in shape. We can expect those builders who have experienced success with it to continue to use it. All enclosed cars are made with a large rear window for observation, and in connection with it the mirror for the driver has real value.

"There is a need for a better method of signaling than the wave of the hand at the side. Touring cars are sometimes provided for this latter purpose with a slit in the curtain when the top is up. Sometimes it is necessary to leave one curtain off. The signals should be automatic, operated by the clutch or brake, and should show a light also.

"The variety in design of mudguards, radiator, hood, lamps, painting and trimming in harmony with the body design is fairly well understood. The mudguards on most cars today are suited for their purpose, and sensible. The front guard looks best when made longer. The rear guard is at its best when it follows the contour of the wheel well down and is just below the wheel center. Radiators should be high to permit a high hood and shrond. They look better when narrower at the top than at the bottom, and there is a growing tendency to have them nickel-plated.

"The hoods will continue for some time to have long, narrow louvres. The demand for as much visibility as possible, which includes at least the enameling of the hoods, mudguards and splashers, controls the painting combinations. The use of dark colors, without striping, prevails. The lamps also are enameled, being relieved with either a nickel rim or band. The greater durability of enamel as compared with painted surfaces is one of the urges toward all-metal bodies, but changes in design and initial high cost will

Michigan Develops a Chinese Art

Modern Methods Applied to an Ancient Business Give State Fourth Rank in Paper Manufacture

IN THE PLANT OF THE KALAMAZOO VEGETABLE PARCHMENT COMPANY, KALAMAZOO

The photograph at the left shows the big "cooker" in which 14,000 pounds of old papers at one time are cooked with live steam for eight to ten hours, as part of the process of manufacturing paper. At the right are shown 14 beaters, which reduce the raw materials to a fine pulp. Each machine holds 1,000 pounds of pulp.

By HOWARD CAMPBELL

THROUGH a hundred years of storm and sunshine a tree has been developing from a seed to a sapling, then to a monarch of the forest, towering among its fellows. Generations of mankind come and go while the tree gathers strength and majesty. Then the lumberman seeks it out and within a few short days it has has become a thousand sheets of thin paper on which are recorded the events of the world—events which had their beginning, perhaps, while the lumberman's axe was yet busily severing the tree from its root.

A magic is this by which a great tree is transformed into a black and white sheet carrying to the public the news of the day, and a strange ending for a hundred years of quiet forest growth.

Paper making is one of the oldest of the industrial arts. Documents made of papyrus some 2000 years B. C. are still in existence. The earliest record in which papyrus can at present be found is said to be a document containing accounts from the reign of Assa, an Egyptian monarch who lived 3580-3536 B. C. The art of making paper from vegetable substance reduced to fiber is ascribed to the Chinese, who are said to have used cotton in the manufacture of paper in the second century B. C. The art of paper making was kept secret by the Chinese for several centuries, but some Chinese prisoners taken by the Moors and Arabs imparted sufficient information to their captors to enable the latter to introduce the art into Samarkand about the year 704. Paper mills were established in Bagdad in the year 795, and in the eleventh century the Moors introduced the manufacture of paper into Europe. In 1336 the first paper mill was erected in Germany, the art becoming established as an industry which soon spread over the world.

In America the first paper mill was established in 1690 at Germantown, near Philadelphia. Since that time the industry has grown rapidly and at present there are more than 1,400 paper mills in the United States and Canada.

The first paper mill in Michigan was a small shack containing a crude machine approximately 30 feet long and 38 inches wide, on which the paper was dried by passing it around a drum, ten feet in diameter and containing a wood fire. The mill was located near the Raisin river, about six miles above the present city of Monroe, and was operated by the River Raisin Paper Company—not, however, the company which now bears that name.

Paper making as an industry started in Michigan when a small mill was built near Ypsilanti in 1855, and has developed until today Michigan has 50 paper mills producing 6,152,000 pounds of paper every 24 hours, or approximately 922,000 tons a year. The state ranks fourth in the Union in paper output, New York being first, Massachusetts second and Pennsylvania third. Wisconsin is fifth and Ohio sixth. More than $150,000,000 is invested in the industry in the Wolverine state and the mills employ more than 11,000 men and women, whose annual salaries or wages total in excess of $18,000,000.

Michigan's paper ontput includes news print and book, writing, envelope, ledger, wrapping and tissue paper, parchment and the paper from which paper boxes and containers are made. The Bryant Paper Company, Kalamazoo, is said to have the largest book paper mill in the world. It produces 400,000 pounds of book paper daily. 100,000 pounds of which is coated. At Monroe is the River Raisin Paper Company, rated as the largest producer of box-board in America,

INTERIOR VIEWS OF THE KALAMAZOO PAPER COMPANY'S MILL, KALAMAZOO

At the left is shown a paper machine, to drive which 450 horsepower is required. At the left side of the right hand picture are cutting machines, which cut from 500 to 1,000 sheets at a time, and at the right are calenderin g machines, which iron the paper, giving it a smooth finish.

Digitized by Google

IN THE RIVER RAISIN PAPER COMPANY'S PLANT AT MONROE

The pasting machine at the left pastes four sheets together, producing 280,000 pounds of board in ten hours. At the right is shown the machine which slots and creases the box-board. Production, 6,000 boxes a day.

with an average of 600,000 pounds of box or fiber board a day.

News print is made very largely of spruce wood, although some balsam and hemlock are used. The first stage in the process of wood pulp production consists in felling the trees and removing the branches. The logs are then conveyed to the pulp mill, where they are sawed into two-foot lengths. They are then put into a machine called a "barker," which, by means of a revolving disc with a set of knives projecting from it, removes the bark. This wood is then put into the grinder, where the pieces are held by hydraulic pressure against the face of a grindstone. The stone usually is about 54 inches in diameter and 27 inches wide. The stone strikes the fibers of the wood at right angles, tearing the wood off in shreds. Water is kept running on the stone, serving to wash the fibers away as they are ground off, as well as to carry off the heat generated by the friction of the stone against the wood.

The ground wood comes from the grinder in the form of a mush and is thinned with water so that it will flow freely. It is now passed through coarse gratings to remove pieces of unground wood, after which it passes through screens, which remove the coarser grains. It then passes through a final screen containing slots approximately 1/100 of an inch wide, and then to the "stock chest," which is a huge tank containing a shafted-paddle arrangement. Here a certain amount (usually about 20 per cent) of sulphite stock is added and the whole thoroughly mixed. It is now pumped from the stock chests to the refining engines, where the fibers are separated. The body of this type of engine is cone shaped, having a small opening at one end and a large one at the other. A cast iron plug, or cone, fits into the shell of the machine, having a shaft through the center which fits into a bearing at each end. Both cones are fitted with steel knives set in on an angle and held in place by hardwood wedges. The cone is inserted in the shell and a plate is bolted on the large end. This plate has a bearing in the center for one end of the shaft. The pulp, or "stock," is pumped from the chests into the small end of the machines and as it passes the knives it is cut into small but quite even lengths, eventually collecting at the bottom of the large end of the machine and passing out through a pipe to another reserve tank, to be drawn as needed for the paper machine.

The pulp and water solution is now very thin, resembling a mixture of milk and water. From the reserve tank, or chest, it is pumped to the paper machine, where it is screened once more to be sure that no lumps or foreign matter get into the machine. It now passes into a box extending across the machine and having an opening at the bottom through which the pulp passes out on to the "screen" of the paper machine. This screen is similar to an endless belt, extending the full width of the machine and being from 30 to 50 feet long. As it travels around the two rolls which act as pulleys, it presents a flat surface from 15 to 20 feet long, the pulp covering this surface. The screen has a mesh of about 70 to the inch, which is fine enough to allow the water to run through while retaining the pulp, and as the pulp travels toward the machine, suction boxes under the screen draw out all of the remaining water which has not been absorbed by the fibers, leaving a layer of soft, moist pulp.

Making the Paper

The screen now carries it between two rolls which squeeze most of the water out, compressing it into a thin layer. The screen passes around the bottom roll and back in the opposite direction, while the paper leaves it and sticks to the bottom side of a felt belt called a "felt," which carries it along between several more sets of rolls, each of which presses more water out and rolls it thinner than the previous set. As it leaves the last set of rolls the belt leaves it to travel alone, the pulp having been compressed sufficiently to carry its own weight. It now passes over a series of large metal steam-heated rolls called "dryers," which dry the paper thoroughly, after which it runs through one or more "stacks of calendars." These are machines having a series of smooth rolls which "iron" the paper dry and smooth.

Wrapping paper, tissue paper, cardboard, tags, wall-board and paper boxes are also made from wood pulp, although the process is somewhat different. Paper for these purposes must have considerable strength; therefore it must be made from pulp having a long fiber, made by what is known as the "sulphite" process.

The Detroit Sulphite Pulp & Paper Company makes paper by this process, using spruce wood for the purpose, which it brings in its own boats from the northern part of Michigan and from Wisconsin and Canada. The logs arrive in eight-foot lengths and are cut into 24-inch pieces at the paper mill. After the bark is removed, instead of being ground, the chunks pass through a "chipper," which chips them into pieces about an inch and a quarter long. These chips now go to the "digester," which is a huge steel cylindrical tank. The digesters, of which there are seven in the Detroit mill, each hold about nine tons of chips. After the digester has been loaded with the required quantity of chips, it is filled with steam and sulphurous acid and allowed to cook approximately 24 hours. It is then dumped into a reserve tank. This cooking process reduces the chips to a soft white mass of pulp. From these tanks the pulp flows through a trough, or water conveyor, through a screen which catches the refuse and such pieces as have not been completely disintegrated. It now goes to the "beaters," where the fibers are separated and drawn out.

The beating process is one of the most important steps in the operation of paper making. A beater is a large vat containing a cylinder on a shaft which extends from the center to one side. This cylinder carries a great number of projecting blades and is suspended over a bed-plate provided with knives tapered in the opposite direction, so that as the cylinder revolves, the two sets of blades produce a cutting motion similar to that of a pair of scissors. By the beating and cutting action of the cylinder and the bed-plate, the fibers are separated and reduced in length, the fineness being regulated by varying the distance between the cylinder and the bed-plate. If the pulp is to be made into tissue paper, it is now sent to the bleaching tanks, where chlorine is added to bleach it. If it does not have to be bleached, it is pumped into the stuff-boxes, where water is added until the mixture is quite thin; passes from the stuff-boxes to the paper machine, where the process is similar to that already described. If tag paper is being made, it passes over a series of 29 steam rolls for drying, but if the pulp is being made into tissue, it is made in a machine where it is dried on one large roll. Wrapping paper is made on a machine which is described later.

The Detroit Sulphite Pulp & Paper Company uses eight tons of sulphur and the same amount of limestone a day for making acid.

The paper from which books are made, is made of about 50 per cent old papers and 50 per cent wood pulp and "filler" varying more or less according to the grade of paper desired. As the bales of old paper come into the mill, the paper is sorted and graded; after which it passes through a "duster," which is a machine containing a fan arrangement which cleans all

Boost Your Lathe Production With

Barker Wrenchless Chucks

You don't have to waste time hunting around for wrenches—adjusting and readjusting chucks—THE BARKER WRENCHLESS CHUCK cuts out all that. It gives you instantly the utmost chuck efficiency service, saving you time and money and increasing output 30 to 180 per cent.

Eliminates the necessity of the installation of an expensive air chuck system.

One pull on the lever and the BARKER WRENCHLESS CHUCK holds the piece with a firm and safe grip, releasing instantly.

Adapted equally for Engine, Turret, or Semi-Automatic Lathes.

Made in sizes 6" to 16", two and three jaws.

We have them in stock.

Some Signs of the Motor Up-Trend

Detroit Manufacturers, Returning From the East, Declare "Tangible Results" Already Have Been Felt

THE consensus of opinion among a great many officials of the automotive manufacturing concerns of Detroit who visited the New York automobile show which ended last Saturday, is that an early revival of the business is to be expected.

Revival is the word used by most of them. "There has been a slump," said one manufacturer. "Now, through the medium of the Show, the machinery which had come to a stop has been started again. It is by no means going fast yet, but it is picking up momentum steadily, and while it will not get its normal speed for many weeks yet, it is just as in the case of the fast ocean steamers, which start slowly, increase their speed gradually and really get going only after they are about three days out of port.

"Within another year we shall have new historical days in the industry—bigger days and better ones. Nothing is so absurd as to imagine that we have reached the zenith in the demand for automobiles. We haven't come to the middle point yet. Great as the number of both passenger cars and trucks is in some cities, the proportion to the population is still in most all states small. When the better conditions in the country again prevail—and that will be before another New Year's day—the demand for motor cars will be much greater than most manufacturers are figuring on."

By MARC BRAUN

Returned Packard Motor Car Company officials say more prospects were listed at the Packard exhibit this year than at most any previous Show. A real revival of inquiries from all over the country is reported at the plant in Detroit, and indicates that while the automobile show has been a factor, the revival is being noted in sections having no relation with the New York event. A good many inquiries have been received for trucks from big firms which are in the market now for large numbers of such vehicles. The Chicago show at the end of this month and early in February is likely to have a further decisive effect upon the picking-up of business.

From the Paige-Detroit Motor Car Company comes just as encouraging news. Orders were booked at the Show and a good list of live prospects lined up. The company is said to have placed a new order recently for engines with the Continental Motors Corporation, which seems a further indication that officials believe that conditions are soon to change—or, better said, are already changing for the better.

A decided improvement in general conditions is looked for by Maxwell-Chalmers executives. Just to show that this confidence is not mere hope, but that a betterment has already taken place, production of both Chalmers and Maxwell cars has been increased and from 300 to 400 men added to the working force.

The Continental Motors Corporation, which supplies engines to a large number of the automobile manufacturers, feels much better today than it did ten days ago, or before the New York show. Its officials, upon their return from the east, say that the best evidence as to how they feel may be had in their statements that quite a number of their customers have either increased their orders or placed new ones. That is the reason why both Detroit and Muskegon plants have been reopened.

"We are satisfied with the beginning in the revival in the business," said one of the officers of Continental. "We are getting back somewhat slowly, but we are getting back surely, and we shall be increasing production and increasing our force gradually. Just when that will be no one can tell now, for it may be months. But it is certain that a general betterment is on the way. It has started and I believe that the coming Chicago show, where so many dealers generally come and which is more generally a business show, will bring matters to a head."

From Toledo comes the news that the Willys-Overland Company has increased its force, and while the number is not very large, it is nevertheless encouraging. Some of the officials at the New York show said that plenty of business had been booked and that the outlook was good. As a further indication of improved Overland business, the word has been

Will Resume Parts Production

Detroit Machine Tool Co., in New Factory, Takes Up Work Given Up in 1918; Continues Its Regular Line

DETROIT MACHINE TOOL COMPANY'S NEW PLANT
The building is two stories high, concrete and steel construction throughout, and contains 37,200 square feet of floor space.

DIRECTORS of the Detroit Machine Tool Company, 6545 St. Antoine street, have increased the capitalization of the company from $150,000 to $300,000. The concern has just completed the erection of a larger factory, where it will specialize in the manufacture of ten automotive parts, for production of which it is especially well equipped, in addition to its regular line of machinery. This company manufactures the Detroit Semi-Automatic Drilling Machine and the Detroit Centerless Cylindrical Grinder, both of which are single purpose, high production machine tools.

The company was engaged in the manufacture of parts up until 1918, when the demand for Detroit Drillers and Grinders became so heavy that it was decided to give up the manufacture of parts temporarily and supply the demand for machinery. Exhaustive research and experimental work during the last year has resulted in the production of an improved centerless grinder, and the results achieved by this new machine have resulted in some very gratifying opinions being passed on the machine by machine engineers. The added floor space which will become available with occupation of the new building will facilitate production of these machines, as well as provide ample space for parts manufacture. Only ten parts will be manufactured, all of which call for centerless grinding operations, as well as occasional drilling operations. These are piston pins, valve roller pins, roller clutch pins, straight push rods, oil pump plungers, roller bearing rolls, differential gear pins, short gear shafts, headless king bolts and straight dowel pins.

Incidentally, the grinding department will be the means of training expert operators on this type of machine, and special attention will be given to the teaching of visiting foremen in the rudimentary principles of centerless grinding. The department will be run somewhat on the plan of the well-known Gisholt shop course for foremen and operators.

The parts manufacturing department will be in charge of H. J. Swanson, who also occupies the position of sales manager. Mr. Swanson has spent twelve years in the automotive and machinery industries, as toolmaker, designer and sales manager, and the new centerless grinder is the product of the ability of Mr. Swanson and E. Soholewski, chief engineer.

MACHINE COMPANY CHANGES HANDS

The Ann Arbor Machine Company, Ann Arbor, which in September passed into the hands of a receiver, and which during the latter part of November became the property of a number of Detroiters headed by A. Shipman, passed into control of H. M. Tallman & Sons, Shelbyville, Ill., January 3. S. C. Case, who has been with the concern as manager for the last 15 years, will remain. Just when normal operations will be resumed has not been stated by the new owners.

HALL LUMBER OFFICERS

The 54th annual meeting of the Hall Lumber Company, Lansing, was held last week and the following officers elected: President, B. Frank Hall; vice-president, Mrs. H. A. Hall; secretary-mnnager, Clare W. Bliss; treasurer, Donald S. Olds. The officers and Eugene Hammond comprise the board of directors. The regular annual cash dividend of 10 per cent was authorized. Mr. Bliss in a talk to the stockholders said he believed lumber prices had reached bottom and that 1921 would be a busy year.

AKERS JOINS REPUBLIC TRUCK

F. H. Akers, for the last seven years with the Reo Motor Car Company, Lansing, where he rose to the position of general sales manager, has become assistant general sales manager of the Republic Truck Sales Corporation, which takes care of the sales of the Republic Motor Truck Company, Alma. He will be assistant to A. J. Whipple, who recently joined the Republic organization as general sales manager. Ernest E. Seig, who has been assistant general manager for some time, will continue in that capacity.

Kazoo Masons' Union Cuts the Wage Scale

Expecting a reduction in costs of living, the Kalamazoo branch of the International Brick and Stone Mason's Union at a meeting last week unanimously adopted a resolution to cut the wage scale from $1.35 an hour to $1.25. The reduction is to take effect at once.

The action taken by the Kalamazoo masons, it is believed by the Kalamazoo Gazette, will start similar movements in other cities of the state, although no intimation has been received by the Kalamazoo union that wage reductions are about to take place elsewhere. Secretary Edward McKenna, of the union, said: "We understand that contractors who were paying the carpenters 90 cents an hour have dropped back to the scale of 85 cents. Whether there is to be any other reduction in the wage scales of building trades we do not know, but the bricklayers and stone masons unanimously believed that we could return to our former scale, and we did so."

The wage of $1.35 an hour has been in force since April 1, 1920, when the scale advanced from $1.25. The bricklayers and stone masons ratify their scale in January of each year.

NEW TOLEDO-DETROIT ROAD

Contracts shortly will be awarded for the construction of a 14-mile improved road paralleling the Dixie Highway from Monroe, and to cost $500,000. The highway will run from the northern limits of Monroe to Flat Rock at the Wayne county line, then follow an old plank road. It is to be 32 feet wide, 20 feet to be hard surface. State and federal aid will take care of 75 per cent of the cost. The road is needed to relieve the Dixie highway from the heavy traffic between Detroit and Toledo.

FURNITURE PLANTS RESUMING

Furniture plants in Grand Rapids have resumed operations to a limited extent, and expect to be running at normal capacity by March. The Hayes-Ionia Company has called back 500 men and by February 15 expects to have the full force at work. The Macey Company has 300 men at work and the Haskelite Manufacturing Company, which has been working 50 per cent of its employes four days a week, will resume the usual schedule February 1.

TAX AUTO BODY RE-BUILDERS

Firms engaged in the business of rebuilding tops or bodies for old or new chasses are declared to be manufacturers and subject to federal taxation, according to a new ruling of the Internal Revenue Bureau. Concerns which repair bodies and tops are not subject to the taxes.

VETERAN PENNSY OFFICIAL TO QUIT

C. L. Lockwood, division passenger agent for the Michigan division of the Pennsylvania System, with headquarters in Grand Rapids, has reached the retirement age, 70 years, and February 28 will retire on a pension from the system, which cares for veteran employes in this manner. Mr. Lockwood has served 48 consecutive years with the railroad, beginning as a telegraph operator, and has held the position of division passenger agent since January 1, 1884.

His successor will be appointed March 1.

FAY-KULTGEN NAME CHANGED

John D. Kultgen no longer being connected with the Fay-Kultgen Foundry Company, Benton Harbor, the business henceforth will be conducted under the name Fay Foundry Company, as originally organized. The change became effective on January 1, according to announcement just sent out by the company.

INDUSTRIAL BUILDING

Progress, Projects and Contracts of the Week

Lansing—Work has been started on the construction of a $25,000 garage building for the Lansing Yellow Cab Company. The structure is to be completed about April 1. The garage will have its own heating and lighting system. The company at present has 24 cars.

Grand Rapids—During 1920 a total of 2,122 building permits were issued, aggregating in value $4,545,690, as compared with 1,577 permits issued during 1919, involving $3,686,377. Of the money spent, $495,300 was for new manufacturing plants and $231,000 for additions; $801,950 for residences and dwellings; $310,690 for additions; $93,600 for mercantile and business buildings, and $180,530 for additions; $2,177,986 for miscellaneous repairs; $58,264 for furnaces; $22,575 for barns and sheds; $173,895 for garages. There were requests for 20 building permits aggregating in value $69,300 during the first week of January. This compares with $35,000 expended for construction work during the first week in January, 1920.

Lansing—The Board of State Auditors will ask the Legislature for an appropriation of $50,000 to remodel the west wing of the state capital and prepare a suite of offices for the supreme court justices in the place where the state library now is located.

Jackson—During 1920 the total number of building permits issued was 779 as compared with 1,098 in 1919. The expenditure involved was $1,966,201, as compared with $2,163,289 in 1919. Of the money expended last year, $683,155 was for 145 dwellings and $788,320 for additions and repairs to 147 buildings. Eight factories were built at a cost of $51,900, while the estimated cost for repairs and alterations to 12 factories was $89,600.

Lansing—M. H. Cooper and Albert Ehinger have formed a co-partnership to be known as the Cooper-Ehinger Construction Company, with offices over the Longstreet Lumber Company's rooms, and a warehouse, which will be occupied April 1. The Cooper-Ehinger Company was organized to make a specialty of home and apartment house construction. The concern has already contracted for two homes in East Lansing, and is figuring on a 12-family apartment house to be built in Lansing.

Kalamazoo—The city commission has authorized City Manager Harry Freeman to enter into negotiations with the O. F. Miller Construction Company for the erection of a warehouse at the city yards. The cost of the building, excluding plumbing work, will be approximately $17,500.

Detroit—The Board of Education will ask the common council for a 99-year lease of the site of the present public library, on which the board would like to erect a 20-story administration building.

Continental Motors Shows Net Profit of $3,567,504.17

The annual report to stockholders of the Continental Motors Corporation, Detroit and Muskegon, for the fiscal year ended October 31, 1920, was issued this week. We present below a comparison of assets and liabilities for the last three years, together with the changes in surplus accounts for the same period. The excess of cost over market value of materials purchased for forward delivery is estimated at $250,000, but no loss is expected because the purchase contracts are covered by firm sales orders. To increase in fixed assets represents mainly a substantial increase in the Muskegon plant to take care of demand for truck motors.

The number of stockholders increased to 6,109 during the year, notwithstanding reduction of 6,050 shares of preferred by purchase and retirement through the sinking fund.

Total sales were 15½ per cent more than those for the previous fiscal year. Orders on hand October 31, 1920, totaled $53,584,220, or 64 per cent more than at October 31, 1919.

HAYNES HEADS DODGE BROTHERS

Directors of Dodge Brothers, Detroit, Tuesday elected Frederick J. Haynes, vice-president and general manager, to the presidency of the company, and Howard B. Bloomer, personal counsel of John F. and Horace E. Dodge for 20 years, chairman of the board of directors.

Mr. Haynes, the son of a lawyer, was born in Cooperstown, N. Y., and educated in the public schools of Syracuse, N. Y., and at Cornell University. He is a mechanical engineer by profession and has been with Dodge Brothers since 1912, prior to which he was identified with the Syracuse Cycle Company; Hunter Arms Company, Fulton, N. Y.; E. C. Stearns Company, Toronto; National Cycle & Automobile Company, Hamilton, Ont.; Lake Shore Engine Works, Marquette, and the H. H. Franklin Manufacturing Company, Syracuse, N. Y., in capacities from draftsman to general superintendent.

Twenty-two parts stations have been established in principal cities and eight more are in process.

Net profits were $3,567,504.17, or $141.779 more than for the year ended October 31, 1919. Like Packard and Reo, this company is in an enviable position to take care of a large volume of business without further expense for buildings, machinery and equipment.

Michigan Road Building For 1921 Made Public

Besides completing the road and bridge building program dating from August 2, 1917, the State Highway Commission plans to construct between 150 and 200 miles of hard surface road in 1921. Highways contracted for, state trunk lines, federal aid roads and those under the Covert act, total 1,353.6 miles, of which 783 miles have been completed. Bridges of 30 feet span or more contracted for number 251, the number completed being 189. The costs of highways will total $21,647,455, apportioned as follows: Trunk lines, $10,870,019; federal aid, $6,541,999; Covert act, $4,235,435. Cost of bridges, $2,100,000. The Commission hopes to complete all roads and bridges contracted for in 1921. Road contracts by counties follow:

FOUR-DRIVE TRACTORS OFFICERS

Officers elected by the Four-Drive Tractor Company, Greenville, are as follows: President, George Lynch; vice-president, John G. Martz; secretary-treasurer, W. A. Stillwell. C. A. Watson has been retained as manager.

Solving the Price Problem

W. & S. 3¼" Capacity 2-A Finishing a Shaft.

Investigating Warner & Swasey turret lathe methods and tooling may suggest a solution of your price problem. The investigation may disclose to you a way of getting greater production at less cost.

Whether you have few or many turret lathes in your plant, now is the time to investigate whether or not you have been getting the most out of them. It may be a new tool or two will increase your production materially, or perhaps, by rearranging the tools you have.

Write us and we'll have one of our engineers to visit you if you like. No obligations, we just want you to be thoroughly acquainted with our service so you can call on us when you need us. When business picks up you *will* need us.

TRANSPORTATION NEWS

Rail :: Commercial Hauling :: Water

Detroit—The Thumb district is beginning the shipment of its hay crop. This movement and that of potatoes, small grain and flour has started from Pere Marquette Railway points, according to H. O. Halsted, superintendent of car service. There is likewise a greater general activity among the motor car companies and manufacturers of accessories reflected in the orders for cars which have been received by this department. Mr. Halsted, incidentally, points to the return of cars to the home lines which had been away ever since the "scrambling of the railroads" while under federal control. On December 1 there were only 3,500 Pere Marquette cars on the home lines, while on January 1 the number was 8,200. On December 1 there were 12,200 Pere Marquette cars on foreign lines, while on January 1 this number had receded to 9,200.

Grand Rapids—A 10 per cent reduction in freight rates on sand and gravel is the compromise offer of the railroads operating in Michigan, in the controversy over the 40 per cent increase granted by the Interstate Commerce Commission, according to Assistant Prosecuting Attorney Gelb, who represented the Kent county road commission in the matter. The railroad representatives have asked the state highway commission for another conference with the state and county road men. "The railroads are stalling us," said Managing Engineer O. F. Hess, "but we intend to carry our fight to the Michigan Public Utilities Commission, if we can't get what we want by other steps."

Port Huron—Completion of the channel in the St. Clair river, which was started last summer, is promised by May 20, 1921, the work having already been 77.5 per cent finished on January 1, according to a letter from Brigadier General H. Taylor, acting chief of engineers, written to Rep. Louis C. Cramton and forwarded to the Port Huron Chamber of Commerce.

Lansing—To care for the greater volume of freight business here, the four steam lines are preparing to increase their facilities. The Grand Trunk plans to add to its track storage to accommodate 500 cars. The Pere Marquette, New York Central and Michigan Central acquired land for additional trackage some time ago and have new yards south of the city. Further improvements are contemplated. Factory growth and production, and the increasing number of jobbing and wholesale houses will provide added tonnage.

Detroit—The Pere Marquette Railway has accepted delivery of 10 Pacific type passenger locomotives of the 12 which were ordered early last spring. The others will leave the shops of the American Locomotive Works at Dunkirk, N. Y., within a few days. The new locomotives represent a total outlay of $735,000, or approximately $61,250 each. They will be assigned to service on the Chicago, Detroit, Toledo and Saginaw districts.

Lansing—As forecast in these columns last week, Michigan railroad employe interests have introduced a "full crew" bill in the legislature. Senator Byron H. Hicks, Owosso, sponsors the measure, which affects only companies operating more than four trains in each 24 hours. Under the bill, freight trains of 50 or more cars must have crews of six men, which, in effect, adds one flagman to present crews. Where trains consist of less than 50 cars, the crew must be composed of five men. For passenger trains the crew strength is fixed at five men. The bill provides that a flagman shall not perform the duties of baggageman, express messenger or porter.

Minnsapolis—Reduction in the working week in the shops of the Minneapolis, St. Paul & Sault Ste. Marie Railroad is announced by Edmund Pennington, president of the company. Hereafter the shops will operate 5 days a week. The reduction affects 1,400 men.

Detroit—Federal Judges Tuttle, Killits and Denamore have taken under consideration the question of whether the state of Michigan has the right to prevent the railroads from putting into effect a 3.6-cent fare in intra-state traffic authorized by the Interstate Commerce Commission. Seven railroads brought suit to restrain the Michigan Public Utilities Commission from interfering with the federal tariff, and arguments have been completed and briefs filed.

Miss Kellor Bespeaks An Immigration Program

Miss Frances A. Kellor, New York, an international authority on the subjects of Americanization and immigration, was the guest of the Detroit Board of Commerce, Monday evening, at which time she discussed "Immigration and the Future."

Miss Kellor, who recently returned from Europe, stated that a new immigration problem had been raised by the war. Since the armistice had been signed emigration had far exceeded immigration. There had been a great exodus to the central European states, where the returning emigrant's American dollars make him a man of financial power among his stricken countrymen. She predicted that with the full restoration of trans-Atlantic service, thousands of the war sufferers would flock to this country, thereby reviving the great problem which the U. S. has for many years been forced to contend with. Miss Kellor declares that the United States has never gone at this matter in a scientific way and that it is now time to adopt a definite, comprehensive policy along sane lines.

At the close of her talk, it was voted to empower Frank Cody, chairman, to appoint a committee to draw up resolutions commending the United States Senate committee on immigration for its efforts in behalf of a scientific program.

Miss Kellor is the author of several books on Americanization and immigration and recently appeared before the Senate committee to aid in deciding the question now before Congress in regard to excluding the alien from this country for an indefinite period.

CENTRAL RIVER CONTROL DISCUSSED

Centralized control of the Detroit river front is desired in expectation of the development of the city as a world port when the Great Lakes-St. Lawrence route to the ocean is realized, and to that end business men of Ecorse, River Rouge, Wyandotte, Trenton and Detroit are working. A meeting of these representatives was held Friday and the subject discussed.

LANSING CO. BUYS WAREHOUSE

The Lansing Company, Lansing, a large user of lumber, has purchased a four-story warehouse in Chicago valued at $50,000. The company now owns warehouses and offices in Chicago, Kansas City, San Francisco, Minneapolis, New York city, Philadelphia and Poughkeepeie, N. Y.

30% MOTOR TARIFF ASKED

The National Automobile Chamber of Commerce has reached an agreement on the tariff proposition. At a meeting of the organization in New York last week, the directors appointed J. Walter Drake, of the Hupp Motor Car Corporation, chairman of a committee to ask the ways and means committee of the House of Representatives to include in the next tariff bill a clause fixing automobile import duties at a flat 30 per cent. Some members of the Chamber had expressed themselves as being in favor of free trade. Another committee, of which George F. Bower is chairman, will go to Washington to oppose a reduction in the tariff on aluminum, of which the industry uses 130,000 tons annually. Frederick J. Haynes, president of Dodge Brothers, Detroit, was elected a member of the board of directors of the Chamber, taking the place of the late Horace E. Dodge.

SEWELL SALES 61½ LARGER

For the fiscal year ended December 31, 1920, sales of the Sewell Cushion Wheel Company, Detroit, manufacturer of resilient motor truck wheels, showed an increase of 61 per cent over sales of 1919.

STUDEBAKER'S 1920 OUTPUT

A statement just issued by the Studebaker Corporation, Detroit and South Bend, Ind., says that 1920 was the biggest production year the company ever had. The output was 52,000 cars, as against 38,530 in 1919. Also 52,000 to 28,000 were manufactured after July 1. The company's sales during the last quarter totaled 10,000 cars. The number of unsold cars on hand is 1,600—two weeks' supply.

PEEL WINS PROMOTION

Willys-Overland, Inc., Toledo, announces the promotion of Roy Peel, sales manager of the New York branch, to be manager of sales and service of the entire Overland organization. Mr. Peel has taken up his new duties.

FRANKLIN'S RECORD PRODUCTION

In a statement of business for 1920 the H. H. Franklin Manufacturing Company, Syracuse, N. Y., informs this publication that it shipped a total of 10,566 Franklin cars of an aggregate value of $35,000,000. The record shipping day was March 29, when 109 cars left the plant, while the best month was March, the total shipped being 1,542. The last month of the year was the largest December record in the history of the company, 1,041 cars being shipped, while orders received from dealers during the month totaled 1,063. The company considers the outlook satisfactory, and believes the resumption of business depends largely upon the individual efforts of dealers and salesmen.

CHANDLER-CLEVELAND OUTPUT

During 1920 the Chandler Motor Car Company, Cleveland, made 23,323 cars, which total is 5,356 in excess of its 1919 output. The Cleveland Automobile Company, more or less related to the Chandler, but building a lower priced car, completed 15,834 machines.

FORD ADDS TO TIMBER HOLDINGS

A special dispatch from Marinette, Wis., to the Detroit Journal says that Henry Ford has purchased 1,950 acres of timber land near L'Anse, Mich., from C. Kelsey and John E. and Herbert A. Brennan. The consideration is reported to have been in the neighborhood of $50,000. The tract is in Baraga county and comprises six sections adjoining other holdings of Mr. Ford. It will be developed for Mr. Ford by the Michigan Iron, Land & Timber Company, Iron Mountain.

A NEW HEADLIGHT BRIGHTENER

A device for intensifying the headlights on a Ford car, so that by stepping on a button, as brilliant a light may be obtained in high as in low gear, is now being manufactured at the plant of the Kirchen Machine Company, Lansing.

SIMPLEX WHEEL RE-ELECTS OFFICERS

Directors and officers of the Simplex Wire Wheel Company, Cadillac, have been re-elected as follows: President, J. P. Wilcox; vice-president, W. E. Curry; secretary-treasurer, J. C. Ford. The other directors are J. B. Wagner, W. A. Kyser, C. R. Smith, C. A. Saunders, George J. Sandel and C. F. Williams.

AUTO INSURANCE RATES CUT

As a result of Detroit's intensive safety campaign, motor car liability insurance companies have lowered insurance rates on passenger cars and trucks in the city and in some suburban localities. New rates mean a saving of from $8 to $8.50 on passenger cars and more on trucks, in suburban and rural districts a cut of $5 has been made.

PONTIAC PLANTS IN PRODUCTION

The Oakland Motor Car Company, Pontiac, is producing 75 cars a day on the present schedule and the General Motors Truck Company is working on one model, will have another in production in February and by March expects to be producing the five models manufactured by the company. The plant is being operated with 50 per cent of its regular force.

DODGE ORGANIZATION COMPLETED

Arthur T. Waterfall has been elected vice president and assistant general manager of Dodge Brothers; Harry W. Popeney, secretary; R. J. Fry, assistant secretary, and Charles W. Mathison, sales manager. Frederick J. Haynes recently was elected president and general manager. The directors are Mr. Haynes, Mr. Waterfall, Howard B. Bloomer and John Balantyne, president of the Merchants National Bank, Detroit.

CURRAN-DETROIT RADIATOR CHANGES

Dr. Edward T. Curran has relinquished the presidency of the Curran-Detroit Radiator Company and W. J. Murray has been elected in his stead. C. S. Reid has been elected vice president, and H. H. Rowe, treasurer and general manager. H. F. Lacey, former assistant secretary, has been elected secretary. J. A. Kring, sales manager, and H. I. Phillips, factory manager, have been elected to the board of directors. The outlook for business according to Mr. Rowe, is even better now than it was January 1 and the company is going ahead with plans to take care of its increased trade in the special Ford radiators.

FORD PROFITS AND LOSSES

A Ford dealer located outside Michigan has an advertisement quotes part of a letter from the Ford company in which it is stated that the company is losing money on its three most popular models. The following schedule of profits and losses are given: Touring car, loss, $30.52; roadster, loss, $44.36; sedan, loss $31.88; coupe, profit, $30.60; chassis, profit $1.79; truck, profit, $30; tractor, profit, $60.

Main Durant Factory Probably in Flint

Durant Motors, Inc., will locate one of its units probably the main plant, in Flint. W. C. Durant, head of the new concern has wired the Flint Journal as follows:

"You may say to the good people of the best little city in this country that one of the plants of Durant Motors will be located in Flint. Say to those who so thoughtfully remembered me that I am most appreciative of and quite overcome by their kind messages of friendship, confidence and affection."

As far as is known at this time, Durant Motors will have two and possibly three plants, one of which will be the main manufacturing center while the others are likely to be assembling plants. While the information does not come from Mr. Durant, a man close to him stated that the new car is expected to be made on a system similar to the one which has so well succeeded with the Ford Motor Company, namely by having all the parts made at one plant and assembled at branches.

This man, who is connected with the industry, said he had been informed that half a dozen of the best known banks in the country had advised Mr. Durant that he need not worry about being granted credit to the extend of many more millions than the capitalization of his company.

Within the week following the announcement of Durant's new venture more than 150 requests were received by him from business organizations throughout the country and from private persons, asking him to locate in their respective cities.

A. F. Hohensee, who was a director, vice-president and an executive committeeman of the General Motors Corporation, resigned to become associated with the new Durant company.

KELLEY TIRE CHANGES NAME

James Martin, president of the Martin Tire Corporation, New York, has acquired an interest in the Kelley Tire & Rubber Company, New Haven, Conn., and the name of the concern has been changed to the Martin Tire & Rubber Company.

CADILLAC RESUMES JANUARY 24

A return to activities in all its departments, beginning Monday, January 24, is announced by officials of the Cadillac Motor Car Company, of Detroit. Men are being added and will continue to be added in various departments, the increase to be greater in some than in others. For instance in the assembling department the activities will be greater at first than in the finishing department.

Cadillac officials upon their return from the New York show stated that they are pleased with the results and more so with the outlook for the future. They do not hesitate to predict an early revival in buying.

DETROIT LIFE GAINS

The annual report of the Detroit Life Insurance Company, which has just come to hand, exhibits interesting gains for the fiscal year just ended. Insurance in force December 31, 1920, was $22,004,300, an increase of $5,127,229 during the year. New business put on the books totaled $7,581,444, which is said to be the largest amount of new business done in Michigan by any Michigan company. It is an increase of 43 per cent over 1919. Total premium income in 1920 was $769,979, an increase of $204,348.

EVERYBODY HOPES TO OWN A MARMON

For Sale—The prettiest Marmon Coupe in Michigan; driven less than 12,000 miles; has a most excellent power plant and is fully equipped; everything in fine condition. Box W, Michigan Manufacturer and Financial Record, 611 Free Press Bldg., Detroit.

"QUALITY"

Manufacturers of the Six-Spindle Automatic Screw Machine

IN THE purchase of Screw Products QUALITY is the all-important consideration. "Prompt delivery" and "lower price" count for little if QUALITY is uncertain.

"NEW BRITAIN" QUALITY is based upon a careful analysis of every shipment of material received; the employment of stock of correct physical characteristics for the use intended; and the accurate inspection to gauge of the finished work.

If yours are QUALITY requirements, we would be glad of an opportunity to figure on them. Send samples or blue-prints — or write or 'phone our Detroit representative to call.

The New Britain Machine Co., New Britain, Conn., U.S.A.

MICHIGAN MANUFACTURER AND FINANCIAL RECORD

EDITORIAL

DETROIT, SATURDAY, JANUARY 22, 1921

Tax Free Bonds and the Housing Problem

THE STATE OF MICHIGAN, during its period of greatest industrial activity, had many difficulties. Perhaps not the greatest of these—all of which were incidental to rapid industrial growth—but one of the greatest was that concerning the housing of its industrial population. Great numbers of workers had been attracted from outside the state's borders to its industries. In some cases the populations of cities were doubled in a short time. The reactions were (1) increased rentals for the homes already available as the result of a demand far in excess of supply; (2) a demand for additional homes created by the requirements of the added population, and the bidding of the newcomers for the available spaces, and (3) the doubling-up of families in single homes and the conversion of space formerly held necessary for the housing of single families into quarters capable of being rented—we do not say capable of accommodating—many more persons than were theretofore allotted to them. A secondary reaction was an advance in the selling cost of homes, the new rental prices being made the basis of figures of income production from residence property which was held to justify the new capital costs placed upon them. Following this came the increased cost of new homes, growing out of various causes. These included the demand which impinged upon the normal supply of building materials, which became suddenly affected by abnormal requirements of them, the increased cost of labor employed in building growing out of its own increased rental costs and other operating causes which finally had their only logical result, namely the cessation of building. Among these other operating causes was the high price of money available for such investments. Money invested in real estate required a gross return of 12 per cent on an artificially inflated building cost. Any real estate operator in Michigan will bear out the statement that buyers of residence property based their rentals upon one per cent a month of the cost price of the properties. The cost prices, in their turn, were based upon the premiums which had to be paid for the money necessary to build. These premiums were of various kinds. Here were the charges laid by the money-lending banks upon the processes of getting mortgage loans. Sometimes these were bonuses paid to brokers who made the transaction. Sometimes they were fees for bank attorneys who passed on the titles. Again they took the form of insurance commissions upon excessive fire insurance protection, the money-lenders directly or indirectly participating in the commissions upon such insurances. Then there were fees and bonuses for second mortgages or discounts on contracts of sale, all equally charges against the final buyer of the property, and, in the last resolution, advances in the prices which must be paid for the occupancy of homes, whether in the form of rent or periodical payments applicable in one part to the payment of interest and taxes, and in other part to payments upon the principal sum due on the purchase.

As a next step in the process of firmly and permanently fixing these advanced costs upon the users of homes, the tax assessors put the residence properties of the tate upon the tax rolls at the enhanced prices, which included, as we have shown, the increases in building materials, building labor, commissions and bonuses on money negotiated in a close market, and all the other things which entered into the cost of making homes. Valuations once put on tax rolls rarely change, except in the direction of advance.

Now all these conditions were the economic result of a small supply of capital available for home building. That was readily conceded, because it is one economic fact that is as plain as the nose on one's face. Manufacturers all over this state, forced by the necessities of the condition, began to appropriate money—which was originally gathered together to be invested in industry—to house building plans and schemes. To the extent that this was done, industry suffered. Money raised for industrial capital ought to remain in industry. Money for real estate development ordinarily comes from other sources, non-competitive with industrial capital. At any rate, Mr. Durant had to carry out his splendid housing schemes at Pontiac and Flint. The Detroit employers of labor put a couple of millions at the disposal of a housing corporation. In Grand Rapids industrial capital was diverted to residence building. In as small a place as Howell an operation of the same kind was effected. The cities of the state generally had the same necessity set before their industrial leaders of taking capital out of industry and putting it into housing.

All this time the state, through its laws exempting municipal securities from taxation, was competing with the necessities of housing in this state. A body of capital estimated to be as great as $300,000,000 was invested in tax-free municipal bonds. This capital paid no tax. The housing capital was, once fixed, assessed at its full value, or very near it, and a levy of about $24 per $1,000 laid upon it. Moreover, to get this capital into real estate or industry the real estate or industrial investment was forced to offer, according to Chairman McFadden, of the House committee on banking and currency, a price better than 7.3 per cent net of all taxes and charges, if it asked money owned by a citizen with $100,000 annual income, and 14.9 per cent if it asked money from a citizen with a million-dollar income, before it could compete with the advantages offered by tax free bonds, in exemptions from taxes, state and federal.

Moreover, this exemption of capital invested in municipal securities on a tax free basis is reacting still further on the ownership of residence property in Michigan and making the carrying of such property unjustly burdensome. The total equalized value of this state is about $3,500,000,000. If $300,000,000 or more—which is about one-tenth of the taxable capital of the state—is exempt from taxation, that means that nine-tenths of the property of the state is carrying ten-tenths of the burden, or that nine-tenths of it is being mulcted out of about 11 per cent more of the tax burden than it should justly carry.

These are considerations for the people who have been carrying the burdens of housing, who are interested in the purchase, sale and improvement of real estate, and who are good enough bookkeepers to understand that a reduction of one per cent in interest which is paid for by a 2.1 per cent tax exemption is not economical or just. There is a session of the legislature on now at which their protest might be made effective.

Impressions of Dr. Burton

A REAL "HE MAN" is the new president of the University of Michigan. He knows the college professor's usual encyclopedia of big words; he has traveled and he is educated to the nth degree, but withal he is a plain, big-fisted, broad-shouldered, keen-eyed, agreeable individual. He is fully aware of the duty that the state of Michigan owes to its other dependents and institutions, and is decidedly well balanced as to the place that an institution of higher education should occupy in the modern scheme of living; yet his feet are on the ground. The atmosphere that an educator lives in has often been blamed for the warped conception that many professors have

Digitized by Google

of their own importance to society, but this man seems to have accumulated a splendid balance wheel all his own which gives one the impression that he has run on both sides of the road and has decided to steer the middle course. One look at the man breeds confidence and one sentence of his confirms the impression. He is an inspiration complete. His conception of what constitutes a "live man," as given to the Bankers' Club of Detroit, last week at its dinner, is one of the most heartening suggestions offered in these parts in some time. Every strata of society from blue blood to bolshevik may benefit by the preachments of Dr. Burton.

Preserve the Federal Reserve System

REPORTS from a Washington correspondent are that Congress is going to be asked to revamp the Federal Reserve System. A central bank is the new favorite in the eyes of the financial reformers, but what advantages this scheme might offer are not enumerated.

The twelve Federal Reserve Banks as now constituted are still in their infancy; yet they have performed during the last five years unlike babies but more like veterans, and there is nothing in financial history equal to their record of service and achievement. The System is so sound and has worked so well that South Africa and some important South American countries have taken it as a model for rebuilding their governmental financial machinery. On the debit side of the achievement ledger there are also a few entries, but not one defect exists which could not be remedied by Congress without tearing down twelve institutions which have earned their right to exist through service rendered, and without destroying twelve machines which have become accurately attuned to the local requirements, both large and small, of their respective districts. Thirty years were spent in planning and making and about six have been spent in actual performance; and the expense of planning and making is no niggardly item. But now the good and faithful servant is to be revamped and given a new one-piece suit—for what reason no one knows.

As the System is now operating, there is a central control in Washington, and simply that the body which exercises that control is called a "board" should not mislead anyone into thinking that it is any less efficient than it might be if it were designated a "bank." True enough it is that the twelve operating arms of the board are in distant cities and each arm is presided over by a governor and a board of directors, but it must be remembered that in each office there is an agent of the Federal Reserve Board of Washington who has ample authority to see that the orders of the supreme body are properly carried out. Unless the fundamentals of the System are to be changed, and that is unthinkable, the only thing gained by concentrating the headquarters of the whole system in Washington would be merely a physical change of the location of each subsidiary officer's desk. Not long thereafter the close touch that each officer has with his district would be lost and we might hear that the West was being discriminated against in favor of Wall Street.

How many people know that the Boston Federal Reserve Bank lent $97,000,000 to the banks in the South and West on September 3, and that on October 27 the Boston, Cleveland and Philadelphia banks were carrying $247,000,000 of loans (rediscounts) for the Richmond, St. Louis, Minneapolis, Kansas City and Dallas banks? The system of permitting one Federal Reserve Bank which has surplus funds to lend them to other Federal Reserve Banks which are in need of funds accomplishes the very thing which financial men have been working thirty years to obtain. It is one of the chief reasons why panics have been avoided since the System has been in operation; for it permits the flow of credit readily from districts which have a surplus to those which have a shortage. There is no telling what might have happened in November and December had the West been unable to call on the East for funds, and it is only by means of a system of separate units, controlled by a central authority, that this has been accomplished. A small bank in Kansas might have the finest kind of paper in its pouch, but it could not directly convince a bank in Massachusetts that the latter could and should accept the paper as a rediscount to tide over an emergency. Yet with the Kansas City federal bank acting for the small Kansas bank and the Boston federal bank acting for the Massachusetts bank, the operation is simple. A year ago the western federal banks were lending money to the eastern banks.

The inventive genius of the American mind is a wonderful thing, but there is a danger of investing too well unless we try out the new vehicles a long enough time to make sure that further invention is necessary. Every proposal toward making any change in the Federal Reserve System which will destroy the unit scheme and place the entire policies and credit control of the country under one head should be discouraged.

Short Measure Stuff

MR. HARDING TO WASHINGTON

I do not want a lot of jass
When I'm inaugurated;
Please cut out all the fireworks
And fuss that has been dated.

Hang all the flags out on that day
In just the same old manner,
And tell the bandmasters to play
The old Star Spangled Banner.

We haven't such a lot of dough
In the coffers of this nation,
That we can make inaugurals
A time for dissipation.

If on the Fourth of March we let
The bars down for each grafter,
How can we make them understand
What's coming shortly after?

So please don't get too blooming gay,
Don't make your plans too hearty,
It just won't do, and after all,
You know it is my party.

* * *

COAL MEN TO GET EAR OF CONGRESS

—Newspaper Headline.

Make it a boot instead.

* * *

Overseer Volva of Zion City says that there is a vat of whiskey in hell for the punishment of sinners who drank while on earth. That's some consolation at that. It might have been near beer.

* * *

GOO-EY!

A fellow climbed in a canoe
For a ride when he had quite a skoe.
Now the place where he's laid
Has plenty of shade,
And the sky is a beautiful bloe.

—Luke McLuke.

A fellow climbed in a coupe,
With a hurry to be on his we.
He stepped hard on the gas,
But he skidded, alas—
Friends visit his grave every day.

—Canton Daily News.

A fellow whose gas tank was leaking,
Lit a match to assist him in seeking.
He found it, I guess,
By the looks of the mucss,
From his resting place flowers are peaking.

* *

HEIGH, HEIGH

"There will be a dance given at Will Bomsecour's new home in Black River, Wednesday," gonfalons the Cheboygan Daily Tribune. "Good music. Fifty cents per couple. Lots of room for horses." Whereat the Bay City Times Tribune wants to know if the steeds will stage a shimmy.

* * *

We attended a dinner the other day for the benefit of the Hoover Fund where the overseas relief ration was served. We were served rice, dry bread and cocoa. Someone nearby remarked that at the prevailing exchange rates that ought to be equivalent to roast turkey and cranberry sauce in Europe.

* * *

What has become of the old fashioned skirt dance?

—A. F.

$10,000 ADDED TO CAPITAL

The Kent City State Bank, Kent City, has increased its capitalization from $20,000 to $30,000.

CLARK HEADS FIRST NATIONAL CO.

Emory W. Clark, president of the First & Old Detroit National Bank, was elected president of the First National Company, dealer in bonds and investments, at the annual meeting of the company. Mr. Clark succeeds Leo M. Butzel, who resigned to devote all his time to his law practice. D. Dwight Douglas, secretary of the company, was added to the board, other members of which are Henry E. Bodman, Leo M. Butzel, Roy D. Chapin, Emory W. Clark, S. T. Cropo, Samuel T. Douglas, C. G. Edgar, Dexter M. Ferry, Jr., Harry J. Fox, Ben Jamin Gottfriedson, Lewis H. Jones, Gilbert W. Lee, Gordon M. McGregor, W. C. Rands, J. H. Simpson and E. D. Stair. Net earnings before taxes for the year 1920 were more than $175,000. The First National Company, First and Old Detroit National Bank and Central Savings Bank are under one ownership.

PORT HURON PERSONNEL CHANGES

E. J. Ottaway is the new vice-president of the United States Savings Bank of Port Huron, and L. W. Miller, who has been with the bank a long time as assistant cashier, has been elected cashier. The cashiership has heretofore been held by President Cecil Peck. The United States had a healthy growth during 1920.

MUNISING CAPITAL INCREASE

The First National Bank of Alger County at Munising, has voted to increase the capital stock from $60,000 to $100,000, and offered the sale of the increased stock at $150 a share. It was also voted to transfer $20,000 from undivided profits to surplus and thus create a combined capital and surplus of $200,000.

NEW BANK AT JEDDO

Harry Tappan, Port Huron, and William J. Lamb and William C. Ernest, Jeddo, are the principal incorporators of the Jeddo State Bank, Jeddo. The capital is $20,000. The institution will conduct a commercial and savings business.

AMERICAN STATE NAMES BARLUM

John J. Barlum, well-known Detroiter, has been elected a vice-president of the American State Bank of Detroit. He is president of the Postal Steamship Company, president of the Postal Hotel Company, which operates the Hotel Griswold, and is interested in the Barlum Realty Company and Thomas Barlum & Sons, wholesale and retail meat dealers.

A CORRECTION

In our issue of January 1 it was stated erroneously that the quarterly preferred stock dividend declared by the Jewett, Bigelow & Brooks Coal Company was 1¾ per cent. It should have read 2 per cent.

FLOWER VALVE COMING NICELY

At a meeting of creditors of the Flower Valve Manufacturing Company, Detroit, held recently, much confidence was expressed in the outlook for the future of the company. Orders have been coming in in fair volume and prospects of more busines in the near future are good. This concern has been in hands of Union Trust Company, Detroit, as receiver, and is being operated by a creditors' committee.

THEY TAKE AN INTEREST AT ALMA

Stockholders of the First State Bank of Alma surely take an interest in their bank. Eight hundred and nine shares out of 1,000 outstanding were personally represented at the annual meeting, January 11. Reports of the progress of the bank for 1920 showed 884 new depositors. Earnings were more than 8 per cent on stockholders' investments. Capital, surplus and undivided profits were $225,459.01 and total deposits $1,320,335.96. Total assets exceeded $1,500,000. Lester A. Sharp, Francis King, Chas. G. Rhodes, Chas. O. Ward, Carl H. Washburn, J. M. Montigel and E. C. Crandell were elected directors.

TWO LANSING BANKS MERGE

Directors of the Lansing State Savings Bank and the American Savings Bank this week authorized the merger of the two institutions, which will be known as the American State Savings Bank. This is the biggest piece of bank financing in the history of Lansing, and gives the new bank total resources of $7,600,000, deposits of $7,000,000 with 20,000 depositors, and a combined capital of $500,000.

J. Edward Roe, one of the organizers of the Lansing State Savings Bank, and its president, becomes president of the new American State Savings Bank. Charles E. Toms, cashier of the American State Savings Bank, becomes vice-president and cashier. Directors of both banks will be retained, the board to comprise 24 members.

The home of the institution will remain in the Lansing State Savings Bank building, where the American Savings Bank has been housed since the present fire which destroyed the American bank block. While the merger has not been ratified by the stockholders, it is known they are favorable.

The other officers of the new bank are: Vice-presidents, W. K. Prudden, Samuel H. Carpenter, M. R. Carrier, Clarence E. Bement, Donald E. Bates and L. C. Abbott.

FIRST NATIONAL OF GLADSTONE

In sending out its semi-annual dividends for the latter part of 1920, the First National Bank, Gladstone, made it known that the institution had passed the half-million mark and that during the year it increased its totals by more than $125,000 as compared with 1919. The institution will be five years old next August. Plans have been completed for new quarters, which will be erected this year.

Who's Who In Michigan Finance

Frank G. Smith, Vice-President First & Old Detroit National Bank

Frank G. Smith was born in Milwaukee, September 2, 1871, son of Hiram N. and Laura Poole Smith. He came to Detroit with his parents in September, 1875, when his father became associated with Leonard Laurence & Company, manufacturers of picture frames and mouldings. His father died in 1880 when Frank was nine years old.

FRANK G. SMITH

As a boy Mr. Smith attended the public schools but began early to learn something about business by carrying papers after school and by working in a printing office during vacations. On January 8, 1887, at the age of 16, he entered the First National Bank as a messenger and advanced successively through the positions of collector, collection clerk, assistant receiving teller, bookkeeper, receiving teller, corresponding clerk, discount clerk, assistant cashier, cashier and then vice-president.

In looking back over his early business training years Mr. Smith says: "Whatever I have or am I owe to a good mother and to the business training received at the hands of my old friends and associates, John T. Shaw and Emory Wendell, both of whom in their time were presidents of the bank. Michigan never knew any better nor more able bankers than they. In their school I served my apprenticeship and to it I owe whatever success I have attained as a banker more than to any particular talent of my own. Those principles of good business, which I learned as a boy from these two successful bankers, have always stood me in good stead throughout my life, and I hope it will be ever so."

Mr. Smith "hobbies" on his farm on the shore of Lake Huron, which he says is a real producing farm and not a place to "spend money." He belongs to the First Congregational Church of Detroit and the Bankers, Detroit, Detroit Athletic, Boat and Golf clubs.

B. OF C. DIRECTORS NOMINATED

Eight nominees for directors of the Detroit Board of Commerce have been named. Nomination is considered equivalent to election and the new directors will take office April 1. They are: Judson Bradway, Harvey C. Campbell, Harry M. Jewett, Samuel R. Kingston, J. K. Livingston, W. A. C. Miller, John A. Russell and C. B. Van Dusen.

NATIONAL C. OF C. MEETING

Representatives of the Detroit Board of Commerce who will attend the national council of the United States Chamber of Commerce, in Washington, January 27 and 28, are John W. Staley, president of the Peoples State Bank, and W. D. Biggers, general manager of the Continental Company. The housing problem and nominations for officers are among the subjects to be considered. The annual convention will be held April 27, 28 and 29 at Atlantic City.

ST. CHARLES

St. Charles State—Directors: A. T. Sanderson, Dr. W. H. McEwen, Frank Sanderson, Frank A. Bement, Fred M. Dodge (succeeding A. C. Love), John M. Mertz and William C. Mertz of Saginaw. A. T. Sanderson was re-elected president, Dr. McEwen vice-president, and F. D. Vedder, cashier.

FINANCIAL

THE BUSINESS OUTLOOK

By PHIL S. HANNA

FINANCIALLY, matters are gradually and surely righting themselves. After an almost continuous rise since a year ago, the note circulation of the Federal Reserve Banks has begun to decline, the reduction for the second week in January being $110,000,000. Since December 23, 1920, the total reduction has been $220,000,000. Another significant indication of returning normalcy is the further increase in ratio of gold reserves to deposit and note liability, the figure for January 14 being 45.1 per cent for all the Reserve Banks, an increase from 46.4 per cent the week of January 7. Loans by the Federal Reserve Bank to its members, including paper rediscounted for them, went down $150,000,000 during the week under review and purchased acceptances fell off $31,000,000. In the aggregate the Federal Reserve Banks exhibit a falling-off of earning assets of $161,000,000, which is the first time since January 9, 1920, that the total of such investments fell below $3,000,000,000. Since October 15, 1920, this total has declined $453,400,000. Along with these returns there was a reduction of about an even $100,000,000 in the deposits of the member banks (including all deferred and uncollected items).

These figures are most significant at this time and give us concrete evidence of the scaling-down process that business in general is undergoing throughout the country. The loan burden that the Reserve Banks have carried continuously, since the Government first began to lean on them in the financing of its huge borrowings coincident with the war program, is beginning to lighten, as these figures show. Note Circulation is still $265,000,000 more than that of January 16, 1920, but this is not surprising in view of the times, and a continued down-ward trend of note circulation figures should follow the contraction of the loans and deposits of member banks.

The weekly reports of debits of member banks in 153 leading cities of the country reflects not only the contraction of business everywhere evident now but also shows the slowing-down of business following the holiday rush. Average debits per day for the week ended January 12 were $2,439,000, as compared with $2,148,000 per day average for the previous five-day week. A year ago the similar figure was $1,523,000. The complete comparative balance sheets of the combined Federal Reserve Banks and a tabulation of the debits as furnished by the Federal Reserve Board at Washington is given on a following page and we would encourage all students of the business situation who have not already made it a habit to examine these figures weekly, to do so at once.

Liberty bonds at the close Tuesday were still climbing, and all issues except the first 3½s scored gains over a week previous. In fact the gains of the taxable issues again reflect the buying which small investors are supposed to be making of funds heretofore invested in stocks. Foreign exchanges again advanced during the week. Sterling was $3.6275 January 5 and $3.7675 January 18. German marks rose to $1.71 per hundred on Tuesday notwithstanding further increases in currency issue by the Reichsbank and an almost stationery gold reserve.

Those old reliable barometers, bank clearings and commercial failures, are serving us well these days. As regards clearings it must be borne in mind that rising prices during the first half of the year may have given an exhibit of increasing totals while the number of transactions settled thereby was declining. Thus the activity of business, judged by the number of accounts settled, may have begun to decline before the volume of clearings gave evidence of it. The compilation of the Financial Chronicle tells the story adequately and is reprimed here:

CLEARING HOUSE RETURNS

The following table indicates that the total bank clearings of all the clearing houses of the United States for the week ended January 15 have been $7,916,562,332, against $9,467,239,469 the week previous, and $9,838,469,942 the corresponding week last year.

Clearings—Week Ending January 15.	1921	1920	Per Cent
New York	$3,559,386,642	$4,550,546,618	—21.8
Chicago	486,792,385	606,663,182	—19.5
Philadelphia	361,712,801	445,221,617	—18.8
Boston	285,063,247	378,983,021	—22.7
Kansas City	156,606,883	225,229,880	—30.7
St. Louis	128,154,749	167,572,439	—17.6
San Francisco	125,800,000	148,889,161	—15.5
Pittsburgh	121,545,333	133,018,806	—1.4
Detroit	74,491,401	101,759,811	—26.8
Baltimore	72,691,809	81,168,666	—10.4
New Orleans	51,987,860	92,996,090	—44.7
Eleven cities, five days	$5,400,066,111	$6,921,149,316	—21.1
Other cities, five days	1,192,479,928	1,310,371,218	—9.0
Total all cities five days	$6,592,546,039	$8,241,820,564	—20.0
All cities, one day	1,324,016,294	1,596,649,378	—17.1
Total all cities for week	$7,916,562,332	$9,838,469,942	—19.5

There is another factor which we should take into consideration before long. With the country bank loaned up tighter than a drum, how is the farmer going to get funds with which to buy seed, along about March and April? As it appears now, he will have but one alternative, and that will be to sell some of the hoarded grain. Small wonder that the cunning foreign wheat purchasers are unwilling to bid more than about $1.75 for May delivery. Just as likely as not when seeding time comes around one farmer another finds that selling crops is the only way to raise money, there will be a grand rush to beat the neighbors before the avalanche spoils the price. Reports have come in during the last week that here and there a few farmers are selling, and it is to be hoped, not for the city man's benefit, but particularly for the crop hoarder, that a few more sellers will grow steadily the few remaining months of the winter while present prices are offered. For if our farmer friends are holding a savage fist up to the buying world now, what will be their feeling next April, when after waiting all winter, they find prices further diminished?

Money in New York was loaned freely at 6 and 6¼ per cent during the week, with plenty in supply, but this affair is still a long way from affecting Detroit and Michigan. The Chicago Federal Reserve Bank is still quoting 7 per cent on commercial and industrial paper, and mercantile paper running 60 and 90 days still brings around 8 per cent to the discounter. However, there is a sign of weakening at the base of the market. New York, and should the rest of the world by any hook or crook begin to pay up some of the $4,600,000,000 frozen credits tied up in export business, or begin to liquidate either the principal or interest on the $10,000,000,000 war loans, such actions ought to ease the money situation in Michigan and the rest of the interior within a reasonably short time. At any rate, the "hitting-on-eggs" feeling so often noted during November and December has nearly passed.

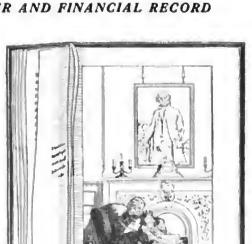
Who's Who In Michigan Finance

William J. Schechter, Cashier, Continental Bank, Detroit

William Joseph Schechter is a Detroit product. He was born February 10, 1876, on Sherman street, son of Karl and Christina Schechter. His father was a brewer and a man highly respected on the East side of Detroit for his staunch character and genial personality. William went to St. Mary's school at the corner of Monroe and St. Antoine streets and then attended the University of Detroit. In 1891 he worked for Richmond & Backus in their shop on Jefferson avenue, repairing typewriters, from which job he went to Port Huron to become shipping clerk for the Michigan Sulphite & Fibre Company. After giving up this work he attended the Detroit Business College.



WILLIAM J. SCHECHTER

While working in Port Huron he became acquainted with the banking firm of Noble & Wagner, and in 1894 he opened the private bank of Noble & Wagner at Port Hope, which he conducted until 1897, when he came back to Detroit and began work in the Peninsular State Bank. He worked his way through various clerical positions up to the position of savings teller, which he gave up in 1911 to become a state bank examiner under former Commissioner E. J. Doyle. On November 1, 1915, he was appointed a national bank examiner and on January 1, 1920, was elevated to the position of chief national bank examiner of the Cleveland Federal Reserve District.

It is a noteworthy achievement of Mr. Schechter's career that during his supervision of the Cleveland district his force examined all the banks twice during 1920, a record that had not theretofore been made by the men in charge of that district. Schechter knows banks from deposits to dividends and he brings to the new Continental Bank 26 years of valuable experience.

Your Children's Future

A Living Trust enables you to provide definitely and adequately for the preparation of your children for their life's work. Your interest in your business—great though it is—does not equal the interest you have in their proper education and training.

Our Book, "Living Trusts", Tells About It

This beautifully illustrated book is interesting reading for anyone—it is doubly so for the man with children. Here is a typical true story from its pages:

"A man died, leaving a widow and several children. The property left was enough to give them every comfort. One of the children, however, was a spendthrift son. He was unmanageable and was constantly getting his mother into trouble. She feared greatly for herself and the children, should anything happen to lessen her strength or ability. She came with her troubles and together we worked out the details of a living trust which provided a good income for the mother and children. It even assured the education and training of the children and the safety of the property in case of her death. Not long after she became entirely incompetent mentally. The trusteeship which she had established now carried forward her plans as she had wished them carried out."

Then, too, Living Trusts solve many other personal and family problems. Let us send you a copy of this book without cost or obligation. Write or phone for it.

Banks and Bankers

FLINT GAINS FINANCIALLY IN 1920

The five banks at Flint showed a gain in clearings for 1920 over 1919 of $15,000,000, despite the falling-off in business since September. Comparative figures follow:

1920.	$130,811,577.
1919.	$116,040,206.
1918.	$ 75,528,093.
1917.	$ 86,256,864.

The Industrial Savings Bank is increasing its capital to $1,000,000, has made extensive changes in its main offices in the Flint P. Smith building and has increased the number of its branches to six by addition of offices in Murray Hill and on Leith street. The Genesee County Savings Bank has completed its new home, which has been in prospect for a long time, the 11-story fireproof office building being one of the finest structures in the city. The First National Bank has taken over the quarters formerly occupied by the Genesee County. The offices will be refinished and rearranged to take care of the growing business of the First National. The Union Trust & Savings Bank has added valuable space to its quarters by moving its abstract department to new, attractive rooms on the second floor of the building, and also has made extensive improvements in its main offices. The Citizens' Commercial & Savings Bank increased its capital during the year from $150,000 to $450,000.

PONTIAC BECOMES A RESERVE CITY

Pontiac banks now have total resources in the neighborhood of $20,000,000 and the importance of the city as a banking center is such that Commissioner Merrick has acquiesced in the request of the Pontiac bankers to designate the banks of their city as "reserve banks." This means that Michigan state banks now members of the Federal Reserve System and who may desire to keep their reserve with the Pontiac banks may now do so. Application for this designation was made about a month ago by Cranor Smith, president of the Pontiac Commercial & Savings Bank, on behalf of all the local institutions.

FIRST NATIONAL OF MARQUETTE

The First National Bank of Marquette makes a statement of condition as of December 29 showing deposits of $3,534,688, and capital, surplus and undivided profits of $349,423.62. This represents a gain of about $100,000 in deposits over a year ago and $41,000 in the capital and profits item.

EMPLOYES BANQUETED

The Wayne County & Home Savings Bank, Detroit, gave a dinner to 24 branch managers and nine officers, January 12, in the bank dining rooms, which had for its object the promotion of the thrift week program. Director Fred Guenther gave the boys an enthusiastic talk on "Courtesy and Good Will."

STATE BANK OF MERRILL

Cashier John Dufty, of the State Bank of Merrill, has favored us with a statement of his institution as of January 8, 1921, showing total assets of $674,790.16. Deposits are $614,163, or more than $50,000 gain over this time a year ago. A praiseworthy feature of his statement is the lack of borrowed money obligations.

FARMERS "STANDING PAT"

D. B. Lyon, cashier of the First State and Savings Bank, Holly, was a Detroit visitor Friday of last week. He reports that there is some disposition on the part of farmers to sell crops but that the great majority are still on strike.

BANKERS' CLUB ELECTION

At the banquet of the Bankers' Club of Detroit, held January 14 at the Hotel Statler, the following were elected to official positions for the ensuing year: President John Ballantyne; vice-president, George H. Kirchner; secretary-treasurer, Charles H. Ayers (re-elected). The meeting was attended by 249 members from Detroit and up-state. Thirty-four new members were admitted. The speaker of the evening was Dr. Marlon L. Burton, president of the University of Michigan, who gave a forceful and absorbing address on the subject of what constitutes a "live man." James T. Keens occupied the toastmaster's chair.

NEW SAFE DEPOSIT VAULT

The Detroit Trust Company is cutting a stairway down from the main office to the basement to provide an entrance to its new safe deposit vault, now under construction. There will be about 1,200 safety deposit boxes, the majority of which will be the larger sizes to care for silverware and other bulky valuables. Plans call for completion about the middle of March or the first of April.

KALAMAZOO BANKS HAVE GOOD YEAR

Figures available from Kalamazoo's four banks as of the close of business December 28 and 29 show that deposits during 1920 gained about $4,500,000. This is believed to be due to the thrift work done by the financial institutions of the city. Bank officials are optimistic regarding the future of Kalamazoo and report that the depression has not as yet been reflected in savings deposits.

TO BUILD IN ROYAL OAK

The property at the southwest corner of Fourth and Main streets, Royal Oak, has been purchased by the Royal Oak Savings Bank from Joseph Braun, of the Braun Lumber Co., Detroit. The lot, which has a frontage of 60 feet on Main street and of 110 feet on Fourth street, was bought so that the bank might have a suitable site for the erection of its own home at a future date. This is the bank that Geo. A. Lehman, formerly of Saline, recently took charge of as vice-president and cashier.

AMERICAN STATE BANK OF DEARBORN

The American State Bank of Dearborn, which started in business about January 1, 1920, has been put on a basis of 6 per cent per year, the first semi-annual dividend of 3 per cent having just been declared. This institution has footings now of more than $500,000. The stockholders and directors feel elated over the success of the institution, which is remarkable considering the fact that it has been in operation only a little more than a year.

READ COMPANY NAME CHANGED

The firm of Wm. A. Read & Company, Detroit, has been changed to Dillon, Read & Company. All of the former partners continue in the new firm, with W. M. L. Fiske, E. J. Bermingham and William A. Read, Jr., added.

NEW IRVING DIRECTOR

At the annual meeting of the stockholders of the Irving National Bank of New York, January 11, James Clarke retired as a director and Hubert T. Parson, president of the F. W. Woolworth Company, was added to the board.

CONTINENTAL BANK BOARD

The following have been elected directors of the new Continental Bank, Detroit, which opens today, Saturday, January 22: John G. Barbas, Charles H. Bryan, Charles A. Burr, Charles W. Burton, William G. Burton, Horace J. Caulkins, Arthur Colton, Louis A. DeHayes, Thomas F. Farrell, Albert Fisher, Alfred T. Gibson, Vincenzo Giuliano, Thomas Glynn, Henry J. Guthand Max Jacob, Henry Komrofsky, Clarence H. Ladd, Anthony Maiullo, James D. May, Otto Misch, Louis A. Peters, Carl Reese, Julius Porath, William J. Schechter, Arthur E. Schreiter, Alvin G. Sheehan, Alexander J. Stuart, Walter G. Toepel, Edward C. Van Leyen.

Michigan Bond Items

Hilliker, Perkins, Everett & Geistert, Grand Rapids, are offering an issue of $250,000 of 8 per cent serial bonds, of the Grand Rapids Brass Company, due serially in installments of $12,500 during the next ten years, beginning July next. The loan is to finance expansions made in the business and for increased working capital.

John C. Thompson, New York bond expert, has placed his approval upon the issue recently voted by Wayne county for the erection of bridges over the River Rouge at West Jefferson avenue and Fort street west.

A New York syndicate consisting of Kuhn, Loeb & Company, Kidder-Peabody Company and the Hilgarten Company has taken up the $10,126,000 public utility bond issue of Detroit at a premium of $153,442.20.

Wayne County's $400,000 bond issue for the insane hospital to be built at Eloise will be taken up by the Detroit Sinking Fund Commission. The hospital will have accommodations for 300 patients and is to be ready August 1.

Mount Clemens has voted to bond for $40,000 to provide for water main extensions and equipment.

Public Utilities

Birmingham—The village commission has decided to begin at once connecting the 12-inch well sunk several weeks ago and to sink another 12-inch well, which will make three wells for the town and add at least 400,000 gallons of water daily to the supply of 275,000 gallons obtained last summer. From the tests made by experts, it is said that Birmingham need not go outside its own territory for all the water needed.

Gaylord—A proposition has been submitted to the municipality by the Cheboygan Electric Light & Power Company, offering $10,000 for the local electric light and power plant and allowing the town to retain title to the land, wells, reservoirs and pipe lines. It is also provided that the town is to contract with the Cheboygan company for not less than 30 street lamps at $110 a lamp a year and for not less than 37 fire hydrants at $20 a year. The company is to have a 30-year franchise. The matter will be submitted to the voters.

Hillsdale—New gas rates for Hillsdale have been fixed by the Michigan Public Utilities Commission. The minimum rate is $1 instead of 75 cents. It the meter is not used at all during the month, the charge will be $1 and for that charge up to 400 feet of gas may be used, as compared to the maximum of 300 feet formerly. For more than 400 feet of gas the consumer will pay 21 cents per 100 feet up to 10,000 feet, less 1 cent per 100 feet if paid before the tenth of the month. For more than 10,000 feet the price will be 18½ cents.

Lansing—Judge Charles B. Collingwood has issued a restraining order in the case of the Michigan Public Utilities Commission and the Valley Home Telephone Company against William J. Moore, owner of the Moore telephone system, which companies operate in the Thumb district. The order restrains the Moore company from further violations of the rate regulations, fixed July 30, 1920, by the Commission and orders the company to send bills to its patrons, whom, it was claimed, were given contracts for future 'phone service at lower rates than set by the Commission. The action was started by the Valley Home Telephone Company.

General Financial News

PANTLIND HAD GOOD YEAR

The Pantlind Company, Grand Rapids, after paying interest on its bonds, will have funds available for its first dividends. The stock is 6 per cent cumulative, $450,000 outstanding, and the dividend will be sufficient to pay the 1920 apportionment. This concern was organized to promote the erection of the hotel. The Pantlind Hotel Company, as the operating company is known, besides paying 6 per cent on preferred stock, disbursed 24 per cent on its common stock last year. The large dividend disbursement has been in part to even up the three lean years when the stockholders received only nominal returns.

REAL ESTATE TAX PROGRAM

The Michigan Real Estate Association, an organization composed of the local real estate men's associations throughout the state, has appointed Lester C. Batdorff, Battle Creek, its executive secretary, with offices in Lansing and Detroit. Mr. Batdorff also will act as field agent for the Detroit Real Estate Board. One of the purposes of his appointment is to organize a campaign to do away with some of the inequalities in the state taxation program, under which, the real estate men allege, real property is compelled to carry 80 per cent of the tax load.

MUNSHAW HEADS INVESTMENT CO.

Officers were elected by the Michigan Investment Mortgage Corporation, Lansing, last week as follows: President, Glen R. Munshaw; first vice-president, Frank S. Coleman, Grand Rapids; second vice-president, Bert J. Baker, Lansing; third vice-president, William R. Burns, Detroit; secretary-treasurer, William R. Town; assistant, V. J. Padgett.

BOND COMPANY ELECTS OFFICERS

The First Bond and Mortgage Company, Lansing, has elected the following officers: President, James I. VanKeuren; chairman of the board, R. E. Olds; first vice-president, Frank A. Stoltz; second vice-president, Smith G. Young; third vice-president, Harry Olstead; treasurer, Carl H. Moelter, and assistant treasurer, William A. Ring. The latter has been cashier.

LIBERTY NATIONAL ELECTION

At a meeting of the directors of the Liberty National Bank, New York, last week, the following officers were elected to serve one year: President, Harvey D. Gibson; vice-presidents, Daniel G. Reid, Alexander V. Ostrom, Charles W. Riecks, Ernest Stauffen, Jr., Joseph A. Bower, James G. Blaine, Jr., Joseph S. Maxwell, George Murnane, Sidney W. Noyes, Maurice F. Bayard.

Frederick W. Walz was appointed cashier; Bert Clark, assistant to the president; Frederick F. McGlynn, Theodore C. Hovey, Louis W. Knowles, Raymond G. Forbes, Danforth Cardozo and Edward J. Whalen, assistant cashiers, and Donald D. Davis, trust officer.

COMMERCIAL FINANCE CORP.

The Commercial Finance Corporation, Grand Rapids, has elected as directors Seymour J. Barkwell, Homer H. Freeland, Anthony J. Pauels, R. H. Schantz, Hugo C. W. Friedrich, George W. Wallace, Martin Charles Huggett, Charles C. Ashton, Bartel A. Beneker, Henry M. H. Friedrich, William E. Slater, John B. Nykerk, James G. Pierce and Oscar W. Braman.

MUSKEGON DEPOSITS GROW

During the last six months of 1920 total deposits of the Muskegon banks increased $10,655.89 in spite of the business depression. Total resources increased $779,037.74. The loan item increased $785,926.77. This is a good showing.

Michigan Bank Elections

ALPENA

Alpena National—Directors: William H. Johnson, William T. Hoey, James H. Kerr, E. C. Spens, John A. McPhee, Nason Johnson, C. H. Osgood and Carl Alfsen.

ANN ARBOR

Ann Arbor Savings—Directors: M. J. Fritz, Carl F. Braun, Emory E. Leeland, William D. Harriman, Walter C. Mack and William L. Walz. Officers: Michael J. Fritz, president; Carl F. Braun, vice-president; W. D. Harriman, vice-president; William L. Walz, cashier; John C. Fritz, assistant cashier. Alfred F. Bush, assistant cashier. Hy. H. Hinsdale, assistant cashier. The vacancy in the chairmanship of the board caused by the death of Chas. E. Hiscock was not filled.

Farmers and Mechanics—Directors: H. J. Abbott, J. E. Beal, G. J. Burke, C. C. Freeman, James Foster, G. M. Martin, G. W. Millen, D. F. Schairer, R. F. Schumacher, S. W. Smith, Charles A. Sink, G. S. Vandawarker, W. W. Wadhams and H. A. Williams. Officers: H. A. Williams, president; J. E. Beal, vice-president; G. W. Millen, vice-president; F. T. Stowe, cashier; E. L. Jenkins, assistant cashier and G. J. Burke, counsel.

First National—Directors: Waldo M. Abbot, S. W. Clarkson, M. J. Fritz, Robert F. Gauss, Harry M. Hawley, E. D. Kinne, Walter C. Mack, George W. Patterson, D. B. Sutton, Erwin E. Schmid, Harrison Soule and Frank A. Stivers. Officers: E. D. Kinne, president; Harrison Soule, vice-president; Robert Gauss, cashier; Charles A. Gruner, assistant cashier; Harry M. Hawley, assistant cashier, and Irwin Stoll, auditor. Harry M. Hawley and Irwin Stoll, assistant cashier and auditor, are new additions to the roster of officers.

BENTON HARBOR

American National—H. S. Gray was re-elected president; W. F. Bowland, cashier, and George R. Bater, W. E. Sheffield, S. E. Doster and A. W. Flintrup, vice-presidents. Directors: Willard J. Banyon, Burr Bertram, J. S. Caldwell, J. N. Kirk, Wm. H. Andrews, J. J. Miller, H. S. Gray, W. F. Bowland, H. U. Rapp, S. E. Doster, A. W. Flintrup, James Jakway, Wm. Chapman, George R. Bater, Michael Daly, Max W. Stock, W. E. Sheffield and Wallace A. Preston.

Benton Harbor State—Officers: H. D. Poole, president; G. M. Valentine, vice-president; M. P. Resch, cashier, and K. E. Sutherland, assistant. Directors: F. G. Bradford, E. C. Bowlby, C. A. Conkey, I. W. Conkey, H. D. Poole, M. P. Resch, D. B. Sutherland, L. F. Sutherland, B. Wm. Wallace, M. B. Wells, G. M. Valentine, B. F. Wells and S. L. Wells.

Berrien County—Officers: John Robinson, chairman of the board; Frank H. Ellsworth, president; Arthur B. Higman and Chas. Young, vice-presidents; James M. Rose, cashier, and Paul Parrish, assistant cashier. Directors: John Robinson, Chas. L. Young, F. H. Ellsworth, Claude P. Sykes, Chas. Handley, W. Irwin Bryan, Jr., Arthur B. Higman, Jas. M. Rose and Albert H. Burger.

Farmers & Merchants National—Officers: O. B. Hipp, president; John R. Price, Milton Hinkley and George B. Thayer, vice-presidents; C. M. Niles, cashier; B. H. Bittner, assistant cashier; Olaf Brevig, second assistant cashier; W. H. Poundstone, trust officer and auditor. All directors re-elected.

BIRCH RUN

Birch Run State—Directors: Charles Wolohan, William B. McGregory, H. J. Frost, Miles L. Hadsell, Frank J. Newman and Ernest R. May. Mr. Wolohan was elected president, Mr. McGregory vice-president, Mr. Frost cashier, and Herbert S. Walter, assistant cashier.

BRIGHTON

Brighton State—Directors: F. T. Hyne, A. L. Smith, G. L. Pitkin, Jr., A. Nelson, F. M. Bergin, W. S. Perry, J. Gallagher. Officers: President, F. T. Hyne; vice-president A. L. Smith; cashier, R. I. Newcomb.

CALEDONIA

State Bank of Caledonia—Directors: Charles Rice, Henry Rice, Fred Ruehs, J. C. Proctor, John Murray and Freia S. Brown.

CALUMET

Calumet State—Directors: Thomas Heatson, Thomas Collins, Joseph Borsch, G. Martini, F. J. Kolhaas, W. J. Uren, O. W. Bruna and Edward Ulseth.

CARSON CITY

State Bank of Carson City—Officers: President, E. C. Cummings; vice-president, E. D. Lyon; cashier, Ira Cummings; assistant cashiers, B. E. Comers and F. C. Burchfield.

Farmers & Merchants State—Officers: President, E. R. Stebbins; vice-presidents, William E. Adams and M. H. Kipp; cashier, Paul V. Bretz.

Additional Bank Elections Will Be Published Next Week

Endorsed By the Home Folks

The CHARACTER as well as the reputation of a Life Insurance Company is a good deal like that of an individual. A reputation may be secured by promises, but CHARACTER is MAINTAINED only by RECORD of SERVICE.

The Detroit Life Insurance Company has endeavored ALWAYS to maintain its standing for SERVICE to the people. That such a standing is secure may be judged from the record of business done in the year just closed. The Detroit Life Insurance Company during 1920 broke all records of Michigan companies in the amount of life insurance sold in Michigan, the total amount being $7,581,442. This certainly is material evidence of the fact that the people of the State of Michigan appreciate SERVICE, and show that appreciation in a most substantial manner.

Another notable evidence of the progress made by the Detroit Life Insurance Company may be seen by an understanding of these two facts:

The average increase in the amount of paid for new insurance in 1920 of all American Companes was 24%.

The increase of the Detroit Life for the same period was 43%.

Pyramids of Progress

INSURANCE IN FORCE

December 31, 1911	$1,729,970.00
December 31, 1913	$4,051,150.00
December 31, 1915	$7,199,500.00
December 31, 1917	$11,750,811.00
December 31, 1920	$22,005,000.00

GROSS ASSETS

December 31, 1911	$234,443.20
December 31, 1913	$314,010.86
December 31, 1915	$484,718.74
December 31, 1917	$902,355.25
December 31, 1920	$1,789,561.39

JUST One Moment, Please!

The DETROIT LIFE is a Company of SERVICE, backed by the PEOPLE, endorsed by the BANKS, approved by the STATE, a HOME institution that offers the MAXIMUM of PROTECTION and SECURITY at the lowest rate consistent with CONSERVATIVE business practice. Maybe you haven't ENOUGH. For details call at the Home Office, Woodward and Forest Avenues, or ask any of our agents throughout the State.

Achievements During 1920

New Insurance Paid for in 1920 *(An increase over that of preceding year of 43%)*	$ 7,581,442
Net Gain Over New Insurance Paid for in 1919	2,276,442
Paid for Insurance in Force December 31, 1920 *(A net increase of 30%)*	22,005,000
New Business Written During the Year	9,439,706
Net Gain Over New Business Written in 1919	2,766,199

INVEST IN 6% DETROIT REAL ESTATE BONDS
and
Help the Housing Situation

These Real Estate Mortgage Bonds are secured by FIRST MORTGAGE on DETROIT HOMES worth more than double the amount of the loan.

The mortgage describes the property and each bond of the series on which the loan is made. *This allows the Investor to select his security, make personal inspection* and *become thoroughly satisfied* before purchasing a bond.

Our Company—which is under the supervision of the State Banking Dept.—guarantees the title and interest coupons, attached to the bonds, and collects the bond, when due, free of charge.

For details call, phone or write.

Detroit to Europe Via the St. Lawrence by 1923

(*Continued from Page 8*)

selling at a dollar a dozen and American eggs at 60 cents. However, the condition in which American egg shipments arrived in England literally turned the British noses upward and stomachs downward. His nicely worked-out plan of exporting shell eggs in quantity deteriorated after he had learned the transportation hazards.

In this condition of mind he met Mr. Thomson, who broached the plan, whereat Mr. Hoban became an ardent proponent, his loyalty being based upon egg welfare lines. Later Mr. Hoban took a broader view of the project and became the American representative of the British interests.

"Whether the present interests do or do not put this project through, it certainly will be taken up by some other financial group, for the possibility of establishing such a route exists, and is important, for the reason that it can be accomplished in two years, whereas the consummation of the Great Lakes-St. Lawrence deep water project cannot be attained in much less than seven years, possibly not for 10 years. In the meantime here is potential business unsought," Mr. Hoban says. "The project we represent involves the expenditure of $21,000,000, which can be underwritten in Europe. I do not say it will be entirely unwritten there, for I assume that business diplomacy will dictate organization of an Anglo-American company, in which case some stock would be sold in this country.

"That such will be the case I cannot say definitely. Even the question of whether the car ferries will fly the British or American flag remains to be answered. That it is not a stock-jobbing venture, I most emphatically state."

The costs of this project are identified with ship building, railway construction, and car building. It is estimated that the trackage on Newfoundland will cost $22,400 a mile, or $3,680,000 for the 92 miles of road with a grade of 1.5 per cent.

Diesel engine-equipped ferries will cost, it is estimated, $350,000 each, or $2,100,000 for the six. Wharves, warehouses, freight and refrigerator cars, loading machinery and other facilities will run into the millions of dollars.

The St. Lawrence is said to parallel the Rhine situation. The Rhine washes German territory and has its mouth at Rotterdam, Holland. It has no canals. Germany has been shipping her products down the Rhine and reshipping for ocean crossing at Rotterdam. Incidentally, Germany, no larger in area than Texas, has undersold the world. The answer is cheap labor, a commercial adaptability that meets the requirements of many different peoples, and cheap transportation.

When a comparison of routes with special reference to distances is made between the proposed St. Lawrence-Newfoundland route and those making New York, Baltimore or Montreal the part of embarkation, the St. Lawrence route has the advantage by more than 400 miles and a great saving in handling charges and hazards.

For instance, the distance from Detroit to Newfoundland is 1,300 miles across Newfoundland, 92 miles, and to England and France, less than 2,000 miles; to Ireland, 1,640 miles; to Norway, 2,164 miles.

From Detroit to New York by rail it is 636 miles; New York to Liverpool, 3,490 miles, a total of 4,126 miles, or an excess of 495 miles over the distance from Detroit to Liverpool by the St. Lawrence route. Incidentally, Newfoundland is 700 miles nearer Rio Janeiro, which interests South American shippers.

The foregoing is the project as laid before Michigan manufacturers and exporters. Mr. Owens informs this paper that he has tentative promises of enough business to keep the proposed line in operation without seeking other patronage. This is not surprising, if one has had the pleasure of listening to the mournful recitals of transportation difficulties suffered by Michigan shippers as they were poured out to the International Joint High Commission at the Great Lakes-St. Lawrence waterway hearing, in Detroit, last fall.

Mr. Hoban expects equal interest on the part of Cleveland, Chicago and other lake city shippers, but says that ferries operating on this route will not pick up business enroute. Rather each lake port of sufficient importance will have its own ferries, thus making an ideal feeder system without the profitless delays incidental to tramp steamer method of operation

WILL BUILD KEROSENE ENGINE

A new type kerosene engine is to be made this year by the Reed Foundry & Machine Company, Kalamazoo. The engine is the invention of E. A. Field, Chicago, and the Kalamazoo company has made a deal whereby it has the sole manufacturing rights. The engine will be used in the Reed tractor, in addition to being marketed as a stationary engine.

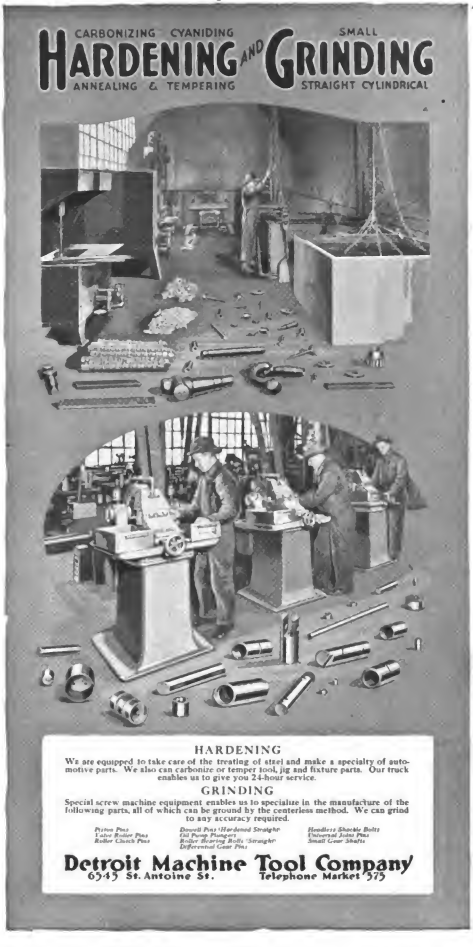
Doing Away With the "Doodads"

(*Continued from Page 8*)

cause the manufacturer of wood frames, aluminum and steel panels, to continue for some time.

"The trimming design of both open and closed cars has remained the same for some time. The straight or French pleat continues to deserve favor. The use of robe-rails is usual, but the foot rest is used intermittently. Even the closed bodies have less ornamentation than formerly, and the omission of toilet and vanity cases and flower holders is common. One dome light and at times corner reading lamps constitute the sole appointments, except that the instrument board may include a clock in addition to the usual necessary equipment. Curtains are used for the rear and side windows only.

"Builders of expensive cars make their product to suit the special-to-order class. Those who produce cars in large numbers for this class of trade usually follow a design that is not extreme, one that relies for its attractiveness on the fine quality of workmanship and the high quality of the material used. The chauffeur-driven car is the rule. The limousine and two-compartment sedan will prevail, with the town limousine, the two brougham and the cabriolet as the types having the lighter bodies."



Mr. Mercer's remarks show the tendency to money-saving conservatism, and Mr. Cowle's opinion will carry weight for the reason that he belongs to a buyer class to which the question of price, where other things are equal, is not so important. Mr. Cowle covered considerable territory in transportation, beginning figuratively in the air and descending gradually to the hard earth.

"The transportation problem is," he said, "the co-ordination of a great number of different types of transportation vehicles, ranging from wheelbarrows to airplanes, such as trucks, single-horse rigs, double-team outfits, automobile trailers, double-end electric platform trucks, automobiles, gasoline motors, gasoline tractors, electric trucks, motor cars and experimental airplanes and dirigibles."

"Cut off all the nicknacks," said Mr. Cowle. "Strip down your chassis until there's nothing left but essentials; take your motor vehicle apart and eliminate every possible non-essential; get down to bedrock, and the put together a vehicle that will be simple and efficient. You will not only cut down your cost of manufacture and your cost of operation, but you will automatically get rid of high cost, accomplish a saving in upkeep and very greatly increase the sale of your product. Automobile design has been too much influenced from the sale standpoint; too much influenced by what your competitor is doing, by what he is using as a talking point, by what he thinks will sell a car to the women. Cut off your freak handles, clean up your dashboard, eliminate all the fancy things—that's what makers of other vehicles do. You must remember that, after all, aside from a special few to whom you sell high-grade fancy jobs, you are selling transportation."

COURT CLOSES CHARLOTTE FACTORY

J. C. Keith is perpetually enjoined from operating his cold air wood register plant in Charlotte by a circuit court decree, it being claimed that the use of the sawmill, planing mill and sander by gasoline engine is a nuisance owing to the noise. B. J. Chibertson was the chief complainant. This action puts out of business one of Charlotte's smaller manufacturing industries, which has been closed several months by temporary injunction. Mr. Keith is offering his home for sale and has been looking for a location for his business in other towns.

Michigan Develops a Chinese Art

(Continued from Page 10)

the dust from the paper, and then to the cookers. These cookers are also cylindrical tanks, but not as large as the tanks in which the wood pulp is cooked. A shaft on each end of the cooker allows it to be revolved, power being supplied by a motor at one end. Soda ash is put into the cooker with the paper and steam is admitted through a journal bearing. The cooking process takes from eight to ten hours, during which time the cooker is slowly but continually revolving, the process thoroughly dissolving the sheets of paper and reducing the contents of the tank to a mass of pulp.

This mass is now dumped into a large vat, where it is stirred until needed for the washers. A washer is similar to a beater, but while the beating is taking place, a stream of clean water is running into the tank and an equal amount of dirty water is passed out. When the pulp has been washed sufficiently, a quantity of bleaching material is added and the stirring proceeds for another half hour. It now proceeds to the beaters, where the required quality of paper is provided for by mixing various kinds of stock together, such as rags with wood, sulphite stock with soda stock, ground wood with various kinds of fibers, etc. Every class of fiber requires its own special treatment, and this has to be varied and modified in each case to suit the qualities of the paper to be made from it; from which it can be seen that the preparation of the pulp is one of the most important and delicate operations in the entire process of paper making, requiring experience, skill and careful manipulation. If the paper is to be colored, the color is also added here.

From the beaters the pulp passes through an agitator, then through a refining engine, and thence to the paper machine, where it goes through the same process as the tag paper. If the paper is to have a smoother finish than that given it by the machine just mentioned, it is run through a super-calendering machine, through a set of rolls which give it smoother ironing, imparting a glossy finish in much the same manner as the laundry irons a starched collar.

Coated and glazed papers are turned out in a coating mill, which is a separate industry. Uncoated papers are colored by mixing the color with the pulp while it is in the beaters, but coated papers are colored by coating the paper with a mixture containing the coloring matter as it is unwound from the roll. As it passes from the first roll to the second, two brushes the width of the paper scrub the color into it so that it will be evenly distributed. As it leaves the second, or receiving roll, it is automatically looped on hangers attached to a chain conveyor which travels slowly over a series of steam pipes, drying the color on. It is now rolled up again and sent to the friction calendering or flint machines, either of which adds the glossy finish. The friction calender irons the paper between two rolls, one of which is steel and the other cotton fiber. This steel roll runs at twice the speed of the cotton one, and the friction which is generated gives the paper a smooth, glossy finish. The "flint machines" are constructed so that an arm holding a smooth flint stone rubs across the paper, thus generating friction which gives the paper the finish desired.

Parchment paper is made from stock containing a large percentage of rags. The rags are sorted as they enter the mill, so that no buttons, rubber or other substances get into the machines. They are then put in the rag cutter, where they are chopped into small pieces. The dust is then fanned out of them in a duster, after which they go to the boilers, where they are boiled and bleached in soda ash for 10 to 12 hours. From here on the process is very much the same as with book paper. The paper, however, is thinner and of finer quality than book paper, and has yet to go through an acid bath, which gives it the qualities necessary in parchment paper.

Heavier Grades

In this operation the paper travels around a roll which carries it through a bath of sulphuric acid, after which it is sprayed and washed through approximately 14 water baths, or just enough to remove all traces of the acid. The acid bath has the effect of making the paper waterproof, however, so that a sack of it will hold water for days without leaking. The Kalamazoo Vegetable Parchment Company is known all over the world for its parchment papers. This company also manufactures waxed paper, which is made by running the paper through a bath of liquid paraffin, through a set of rolls which act as a "wringer" to squeeze out all superfluous wax, and then over a roll which chills the wax; after which it is rolled up again. The "cold" roll is kept cold by a stream of cold water which runs into the roll through one journal, and out through a pipe in the other. This company uses 3,000,000 pounds of India wax a year, in the manufacture of waxed papers.

The paper from which binder board, wallboard and paper boxes and containers is made, is composed of old papers, to which is added a certain amount of kraft, or sulphate pulp. Some of this pulp comes from Maine, some from the South, but most of it from Norway and Sweden. The kraft and old papers are mixed together in the beaters, passing then through the storage tanks and engines and so to the paper machines. The River Raisin Paper Company uses what are known as cylinder machines. In these machines, instead of flowing upon a screen, the pulp flows into a tank under the machine, in which revolves a cylinder of the fine brass screen before described. As this cylinder revolves it picks up a thin layer of pulp above the screen cylinder. Running in contact with it is another cylinder carrying a "felt," which, as it comes in contact with the pulp, picks it off and carries it along. There are several of these cylinders, and as the felt passes along, it adds a layer of pulp from each one, the number of cylinders used depending upon the thickness of paper required. The felt then carries the paper through several sets of squeezer rolls, eventually leaving the felt and proceeding through the paper machine as before described. Binder board or box board is made by pasting several of these sheets of paper together. A pasting machine which pastes these sheets together automatically will turn out 250,000 pounds of board one-tenth of an inch thick in ten hours, and one machine at the River Raisin company's plant has turned out as high as 317,000 pounds, cutting it into three sheets, each 140 inches long, at the same time.

These sheets go through a slotter and creaser, which cuts the necessary slots and makes the necessary creases, so that the board can be folded together in the form of a box. This machine will slot and crease 6,000 of these boxes a day. This company also has its own printing machines, so that such printing as is required can be done on the boxes before shipping to the consumer.

Paper is shipped in various ways; in rolls, in flat bundles, and in cases. If it is to go out on rolls, it leaves the machine ready to be packed. If it is to be shipped in sheets, the rolls are machine-cut to the proper size. In the Kalamazoo Vegetable Parchment Company's plant, a Hamblet cutter stands at the "dry" end of the giant 165-inch Fourdrinier machine. This is a double-acting cutter, cutting two sheets at a time, which are counted as they come out by an automatic counter. Attached to the cutter is a "lay-boy" and, combined these two machines will cut and lay off a minimum carload of paper, 24,000 pounds, in one and one-half hours.

The importance of Michigan as a paper producing state is evidenced by the fact that more than $150,000,000 is invested in the industry. Michigan's mills employ more than 11,000 people, who draw from them nearly $18,000,000 in wages and salaries annually.

Some Signs of the Motor Up-Trend

(Continued from Page 11)

passed on to the Wilson Foundry & Machine Company, Pontiac, to get ready to resume operation February 1. This is a unit of the Willys-Overland and makes many of the Overland parts.

These are other indications of improvement in the automobile situation. The Studebaker Corporation, in announcing 1920 results, says that of the 52,000 motor cars this company built in 1920, 4,000 more cars were made during the second half of the year than during the first, the output being 28,000 and 24,000 respectively. Furthermore, sales during the last three months of the year totaled 10,000 cars, or an average of 3,333 a month, which, considering the conditions then prevailing, is a decidedly good record. All told, officials say, unsold new cars on hand total only 1,600, or about a two weeks' supply. Production both at Detroit and South Bend, Ind., has been resumed on the basis of 800 cars a week at each end, or, all told, 1,600 cars.

In outlining the situation in the Wall Street Journal, B. J. Westcott, president of the Westcott Motor Car Company, says in part:

"Since July 1, 1920, sales have been greatly restricted, being about 20 per cent of the monthly average for the first six months of the year, but compared with corresponding fall and winter periods of previous years prior to 1919, the reduction would not be considerable.

"There is recently noted a marked increase in reported retail sales by agents, although not accompanied by re-orders, which lends encouragement to expect improved factory shipments in the very early future; indeed some slight increase is already noted.

"The splendid spirit of intelligent co-operation upon the part of all branches of the industry and the banks is permitting a situation fraught with grave danger to work itself out in a sane manner. The industry as a whole is basically sound, and the opinion in most conservative quarters is that the end of 1920 marked the culmination of the acute strain, and that beginning the first of the year, conditions improved.

"The automobile trade was among the first to feel the depression and will also be one of the first to recover.

"The automobile industry is third in volume in the nation's business and should be promptly relieved of the burdensome and unfair dis-

Digitized by Google

criminatory production tax, which no longer has the excuse of a war time measure."

The W. A. Paterson Company, Flint, which is one of the smaller yet one of the oldest among the automobile makers, expresses confidence. The demand for its cars has been increasing, and while orders are not coming in by the hundreds, the officials are well pleased with the way business is picking up. The company has arranged to have exhibits of its 1921 models at most of the important automobile shows to be held this and next month in such cities as Philadelphia, Baltimore, Duluth, Minneapolis, Akron, and Chicago.

The H. H. Franklin Manufacturing Company, Syracuse, N. Y., in a recent announcement said:

"The demand, the sales, of Franklin cars has been such that the plant was not closed for inventory purposes between Christmas and New Years, but, instead, departments were kept operating their full time except for actual time required in counting parts. The company put on a 'Big Business-for-December Drive,' engineered by the sales and advertising departments, which resulted in a production of 33 cars a day during the month, as compared with an average of 39 cars a day during the twelve months ended August 31, 1920, and 16 cars a day just prior to our price reduction announcement of last September. The company is carrying on another vigorous sales campaign this month, giving special attention to the southern states, where, generally, business is particularly poor.

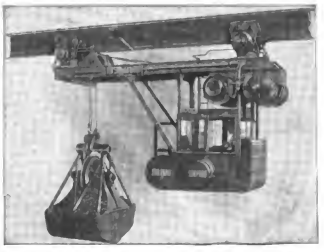
"We are not offering any special inducements to dealers in the matter of credit. Reports show that Franklin dealers are not stocking cars but are selling them as fast as received from the factory.

"Basic conditions are sound, and the great trouble with business today, as a rule, is the policy of watchful waiting."

The Packard Motor Car Company of New York recently made a survey in New York and vicinity of the garages which rent space to more than 1,600 motor vehicles engaged in general commercial hauling, reports the Wall Street Journal, and this investigation, conducted six weeks ago, disclosed that about 50 per cent of all these vehicles were idle.

"By keeping in constant touch with these garages," said president Lee J. Eastman, "we have seen the percentage of idle trucks decrease until today—six weeks after the first survey was made—only about 21 per cent of the vehicles are still inactive.

"In order to check up on the accuracy of the above figures we made another survey of several firms operating fleets of trucks in general trucking, contracting and department store delivery. This was made since the first of this year and showed that only about 14 per cent of the trucks operated by these concerns were idle.



"This constant up-trend in activity in transportation undoubtedly reflects a similar uptrend in business conditions and indicates that in the metropolitan district there has been a decided improvement in the last five weeks."

Surveys of this kind have been made, it is said, by a number of other truck distributors and they have come to the same conclusion.

BELDING FOUNDRY CO. ELECTION

The fourth annual stockholders' meeting of the Belding Foundry Company, Belding, was held in the company's new office building, January 12. Like former years, 1920 proved very successful and the company's finances were gratifying to the stockholders. The same board of directors was re-elected. Henry J. Hartman, of the Hartman Foundry, Grand Rapids; J. C. Jenkins, Big Rapids, and A. B. Johnson, William F. Sandell and Albin Johnson, Belding, constitute the board. J. C. Jenkins, president; William F. Sandell, vice-president; Albin Johnson, treasurer, and A. B. Johnson, secretary and general manager, were again re-elected.

Brakes Go on Truck Over-Sales

(Continued from Page 6)

horses. If the truck he buys fails to bring success to his business, he is sold, but not equipped.

"On the other hand, if the buyer finds he has been equipped up-to-the-minute with profit-showing motor vehicles, and in times of stress is not over-equipped, he has been forever sold on the motor truck as the proper transportation for his business, and the truck industry has made a friend and an unattached salesman."

It was the general opinion of the conference that unwise and unlucky investments in motor equipment had caused a reaction to horse-drawn vehicles, which change of heart can be halted only by a different brand of truck sales-manship in the future and education of the cartage man to the proper utilization of the truck.

The Association seems to be convinced that railroad intercity freight business for distances up to 60 miles will be taken over by the truck. The Association believes the railroads realize this and for that reason are determined that the cartage business shall come under the control of public utility commissions. It is preparing to fight it.

Cost accounting and bookkeeping systems for the cartage business will be developed by the Association with a view to adopting standard systems to be offered the membership. Branch associations are to be organized in Milwaukee, Baltimore, Md., Camden, N. J., Washington, D. C., Boston, Mass., and Quincy, Ill.

Annual Meeting June 20

The annual meeting will be held on or about June 20 in Detroit, or rather Detroit will be the place of assembly, for the delegates are to be taken for a three-day cruise on the Noronic, where all sessions will be held while the ship is cruising about the lakes.

This plan, it is believed, will assure maximum attendance at all sessions. As the delegates will be invited to bring their families along, the convention will become more or less of a vacation trip. The convention committee consists of E. Foster Moreton, Detroit; Thomas O'Brien, Detroit; Joseph X. Gavin, Chicago; H. C. Morr, Philadelphia, and Isaac Goldberg, New York.

Directors elected to fill vacancies are as follows: Thomas O'Brien, Detroit; Hupp Teels, St. Louis; Joseph Cavanaugh, Philadelphia, and P. J. Finnegan, Chicago. The by-laws and constitution are to be revised, the work being left to the former presidents, to report at the annual convention. All the men so far mentioned, with F. L. Henk, secretary of the national association and manager of the Detroit Transportation Association, and J. T. Counsell, Chicago; A. T. Barton, Kansas City; W. T. Grund, St. Louis; W. J. Devine, Philadelphia; George Reichel, Cincinnati, and M. T. Green, Buffalo, attended the conference.

Trailer Makers Indorse An Outdoor Exhibition

Two new officers and members of the executive committee were elected at the annual meeting of the Trailer Manufacturers' Association of America, held at the offices of the Association in Grand Central Palace, New York, a few days ago. J. H. Fertig, Newark, N. J., president, and H. C. Fruehauf, Detroit, first vice-president, were re-elected. Max Herrmann, Beloit, Wis., was named second vice-president to succeed C. H. Martin, Springfield, Mass., and Henry M. Wood, Cincinnati, was elected secretary-treasurer to succeed J. C. Eudebrock, Cincinnati. Mr. Herrmann and Mr. Wood were also elected to serve on the executive committee.

A number of members expressed a desire to participate in a national outdoor exhibition and demonstration of motor trucks, trailers and material-handling machinery in the event that plans for the promotion of such an event begin to take shape in the motor vehicle industry.

Representatives of the following companies attended the meeting: Arcadia Trailer Corporation, Newark, N. J.; Eagle Wagon Works, Auburn, N. Y.; Fruehauf Trailer Company, Detroit; Highway Trailer Co., Edgerton, Wis.; F. P. Lyons, Inc., Manchester, N. H.; Martin Rocking Fifth Wheel Company, Springfield, Mass.; Northway Trailer Company, Rochester, N. Y.; Shadbolt Manufacturing Company, Brooklyn, N. Y.; Trailmobile Company, Cincinnati, O.; Troy Wagon Works Company, Troy, Ohio; Warner Manufacturing Company, Beloit, Wis.

PONTIAC INDUSTRIAL EXHIBIT

The trade and advertising committee of the Pontiac Retail Merchants' Bureau, at its meeting at the Board of Commerce last week indorsed a movement to conduct an industrial exhibit of Pontiac manufactured products which, according to statistics gathered, now number in excess of 20. The exhibit will last a week and all merchants will co-operate, it is said, by devoting window space to the products and to posters of the exhibit. According to present plans, the exhibit will be held during April.

MOTOR FEES SET NEW RECORD

Taxes and fees collected by the Michigan State Department, Lansing, during 1920 for registration of motor vehicles, chauffeurs, operators, transfers, etc., reached the record sum of $5,644,583.02. In 1919 the aggregate was $3,719,423.29. Half of the amount is apportioned to the counties on the basis of the quota paid in by each county. The other half goes to the state highway department, to maintain state highways and pay state rewards, while the county funds are to be used by local officials on roads. About $1,000,000 had been received by the state through the motor vehicle tax up to the first of the year, and it probably has doubled since then. The total number of motor vehicles taxed up to January 1 was 53,549, and trucks, 9,626. Six hundred and nine trailers were licensed.

Federal Incorporation of U. S. Firms in China Urged

The foreign trade committee of the Detroit Board of Commerce has drafted a resolution urging Congress to enact into law the Dwyer bill providing for the federal incorporation of firms doing business in China and the exemption of such firms from income and excess profits taxes so that they may conduct their business upon competitive basis with British and other foreign concerns engaged in business in China.

Federal incorporation is desirable for the reason that the Chinese are not familiar with the incorporation laws of the various states in the United States, and are therefore loath either to invest money in these concerns or do extensive business with them. They do know and are appreciative of the United States, and federal incorporation of American business interests in China would insure their confidence, it is believed.

It is argued that unless federal incorporation is accomplished and exemption from taxation granted, three out of five American corporations in China will have to go out of business. Other foreign firms in China are tax-free and therefore have the advantage over Americans.

WOLVERINE INCREASES CAPITAL

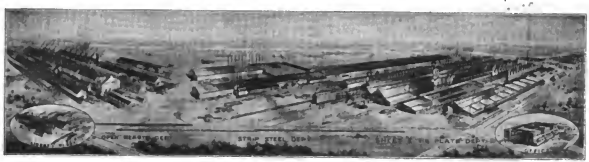
Directors of the Wolverine Insurance Company, Lansing, have authorized an increase in capitalization from $100,000 to $200,000, the is sue to go before the Michigan Securities Commission at once. The company started last June with a capital of $100,000, which is all subscribed. The company proposes to enter eastern territory.

ADRIAN PLANT WORKS NIGHTS

Besides a full day force at the plant of the Peerless Wire Fence Company, Adrian, one department of the plant is being operated with a night force. The working schedule of the factory is four days a week on a 10-hour basis and two days on a 12-hour basis.

Revised Forest Taxation Urged by Commission

The Michigan state tax commissioners have recommended to the 1921 Legislature changes in forest taxation whereby the present system of taxing growing timber would be abolished. The new plan provides an annual tax at a fixed rate upon land value and upon mature timber value, and a percentage tax upon yield, payable whenever any portion of the timber crop is harvested.



The report says that the land value would be the same as the assessed value of wild, unimproved bare land of similar quality in the same locality, while the mature timber value would be the stumpage value of merchantable forest products upon the land, immature forest growth not to be considered in determining either land value or mature timber value. Land value is not to be changed except after regular intervals, while timber value is not to be increased, but to be decreased whenever any yield tax is paid, each decrease to be the same as the stumpage valuation at the time of the harvesting.

The report points out that this plan of taxation would prevent over-taxation by not allowing at any time annual taxation of the growing forest; meets the requirements that the investor shall be in a situation to calculate with a reasonable certainty the future cost of carrying his investment; very considerably reduces the annual tax burden of the owner and provides whereby annual taxation can be reduced to a minimum; protects the interests of the owners of other classes of property and the interest of the local community, and encourages the owner to let his forest stand as long as possible instead of harvesting it quickly.

The report further declares that this preservation and establishment of forests would give industry a new source of raw materials, consumers would be benefited by reduced and stable prices; and farmers would be aided by removal of competition of lands devoted to forestry with lands devoted to general farming. The total amount of taxes forest property would pay annually would be greatly reduced.

The Commission recommends that all of the annual land and timber tax and a substantial portion of the yield tax be allotted to the township and school districts in the township, that the county should receive the balance general yield tax, and the state nothing or only a small portion. The determination of the values would not be left to local assessors, but to the state tax commission.

Increased Production and Higher Earnings for Operatives on "BLISS" Presses

In the plant of the Chain Belt Company, Milwaukee, "BLISS Presses form the backbone of their extensive mechanical equipment. In view of the possible output of these "BLISS" Presses, limited, apparently, only by the degree of dexterity of the operative, the workmen, themselves, asked to be put on a piece work basis in order that they might have an opportunity to increase their earnings.

This was done, with the result that the average daily output was raised to 8,000-10,000 pieces which enabled the company to set a much higher production schedule.

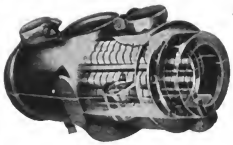
LEADERS

Each and Everyone in Their Respective Fields

American Steel Split Pulleys.

The "original" steel split pulley, correctly designed—well made—true diameters—balanced—light weight combined with strength. Transmits maximum power with minimum belt slip.



U. G. Cast Iron Hanger Frames.

Well designed — strong — simple in construction. Large diameter plungers with lathe cut threads support bearings. Set screws for side adjustment.

Pioneer Steel Hanger Frames.

Made of "Open Hearth Steel"—unbreakable under all conditions — light weight—less expensive to handle, haul and erect.

Hyatt Roller Bearings.

The line shaft bearing of the "Highest Practical Efficiency." Anti-friction of course. Pay for themselves in from 12 to 15 months. Durable—Practical —Efficient.

Limestone Wood Split Pulleys.

Made of selected wood. Rims built in sections, nailed and glued. Arms built integral with rims—cannot work loose. Standard bushings.

Palmer-Bee Transmission provides an equally complete, well known and rated line of clutches —collars—couplings—shafting—and—Charlotte Leather Belting.

Making Steel in Four Hours

Rothert Process, Product of Which Was Tried Out In Detroit, Also Slashes Costs, Proponents Assert

By HOWARD CAMPBELL

SINCE the beginning of time the various stages in the development of civilization have been gauged and marked according to the uses made of the materials with which Nature has provided us. Anthropologists have apportioned the long centuries of man's progress from the pre-historic dawn down to modern times into three areas: the stone age, the bronze age and the iron age, and we are now living in the fourth—the age of steel.

Our modern civilization is practically built on a framework of steel—steel that is handled through the several stages of its production by men who work half naked in terrific heat. But so necessary has steel become to industry that the production and price of it has come to be regarded as a barometer of the world's activities.

For more than half a century the methods of making steel have been the same; in fifty-six years few if any improvements have been made in either processes or equipment, but now out of the West comes the news that a process of smelting has been developed by which the highest grade of steel can be produced from low grade ores in approximately four hours. This discovery was made by Dr. E. H. Rothert, of Seattle, Wash., and is the result of twenty years of experimental and research work. Dr. Rothert is well known throughout the country as one of the foremost metallurgists. What his process will mean to the industrial world can readily be seen when it is known that the total annual consumption of iron is more than 100,000,000 tons, of which more than 60,000,000 tons is produced in the United States alone.

Deals With Titaniferous Ore

The Iron Masters of the world have long known that the present processes of steel making are crude—at best unscientific and burdened with much duplication, waste and excessive cost. And besides this, no process has hitherto been discovered which would deal with the richest but most refractory of all ores, that known as the Titaniferous ore. By the use of Dr. Rothert's furnace and process, however, the highest grade of tool steel, it is said, can be produced from titaniferous or magnetite ore in from four to six hours.

The use of iron probably began in Egypt some three or four thousand years before the Christian era, an iron tool having been found in excavations made while exploring the Great Pyramid, known to have been built at least 4,000 years B. C. Just how the Egyptians made iron is, of course, unknown, but the primitive Iron Master of the first century made iron out of the ore just as he found it, by the use of charcoal. In the fourth century some pioneer scientist invented the bellows, but no further improvements were made until 1735, when an Englishman built the first coke furnace, the forerunner of the modern blast furnace. In 1740 the crucible process of making tool steel was invented and in 1784 the puddling furnace was devised, both of which processes are generally used in steel making at the present time. In 1856 Sir Henry Bessemer, of England, and another genius, although an unhonored one, William Kelly, of Cincinnati, simultaneously invented what has come to be known as the Bessemer process of producing carbon steel.

The present process of steel making begins with the blast furnace, which reduces ordinary hematite ore to pig iron. The furnace as now used is practically the same the world over and is the result of decades of experimentation. The successful operation of a blast furnace depends very largely on the available supply of ore, coke and limestone. The second operation in the production of steel is the open hearth, in which the excess carbon is taken out of the metal and the iron converted into steel ingots. From the open hearth the ingots go to the puddling furnace, where the metal is further decarbonized and impurities removed. Puddlers are among the highest paid laborers in the steel industry, and quite properly so, because they not only work in intense heat, but at labor which shortens their lives.

The next step is the crucible furnace, in which the steel is again melted, the desired percentage of carbon added according to the grade of steel required, after which the product is again poured into ingots. The final process in the manufacture of tool steel is the reheating of the ingots in the alloying furnace, where such additional chemicals as chromium, nickel, etc., are added; then the rolling, hammering and tempering.

In 1864 the last great step forward in steel making methods was brought about by Martin Pierres, a Frenchman, who developed the open hearth process, which has since practically displaced the Bessemer process. Since that time no appreciable progress had been made until recently, when Dr. Rothert completed his experiments with the development of an electric furnace by which it is said he produces crucible steel from crude ore in from four to six hours. In other words, if the claims made for it are correct, in a single process and at a total cost of less than ten cents a pound the Rothert Furnace covers the whole ground of the blast furnace, open hearth, puddling furnace and crucible furnace.

Iron ore and fluxing material placed in the Rothert Furnace is at the end of four hours poured as steel ingots of the greatest tensile, tension and compression strength, it is asserted, eliminating the pig-iron stage of production. And so perfectly has Dr. Rothert said to have advanced his process that the heated crucible steel can be conveyed direct from the electric furnace to the alloying furnace, from which he can produce any known grade of alloyed steel. This includes the finest grade of tool steel, from which razors, knives, etc., are made. This steel has a tensile strength of 24,800 pounds per square inch.

By this process, also, the element of Titanium which has hitherto been considered an insuperable barrier to the smelting of magnetite ore not only is utilized but becomes the most important element in the steel. The importance of this fact will be patent to metallurgists and steel workers.

The Saving Claimed

A study of recent market prices shows that carbon steel sells at approximately 35 cents a pound, with high speed or alloyed steel selling at around $1.40. By the Rothert process, it is declared, carbon steel can be produced at a cost of 10 cents a pound, and the finest tool steel at a total cost, including reheating, alloying and rolling, of approximately 70 cents.

Since completing his furnace and processes Dr. Rothert has been visited by a number of scientists and metallurgists, some of whom hold chairs of metallurgy and chemistry in various schools, and who wished to see the operation of the furnace for themselves. Some of these men personally assisted in the work, and all of them are agreed, so it is said, that Dr. Rothert's discoveries will revolutionize the steel industry. The Continental Motors Corporation, Detroit, has tested the steel, and R. W. Carney, superintendent, is quoted as saying that "the carbon steel furnished for test takes a nice temper and shows a beautiful grain after hardening, which makes it highly efficient for drill stock and chisel work."

The principle on which the furnace is built, and the exact stages at which the various alloys are added in the Rothert process are, of course, jealously guarded by the inventor, who is said to have obtained patents covering every phase of the proposition, but who is withholding the information to protect his own interests.

The plant of the Rothert Process Steel Company is located in Seattle, which city was selected because of the presence in that locality of very large quantities of all the materials entering into the process of manufacture, in-

Digitized by Google

POURING THE METAL INTO THE INGOT MOULDS IN THE PLANT OF THE ROTHERT PROCESS STEEL COMPANY, SEATTLE

cluding electric power. Huge deposits of magnetite iron ore are said to be owned by the company in the vicinity of Seattle and on Vancouver Island, and negotiations are reported to be under way for the purchase of other deposits within 60 miles of Seattle. Native ores run from 60 to 65 per cent iron in quality, as compared with a 30 per cent iron content of hematite ore now in use in the East.

What the development of this process on a large scale will mean to all industry can hardly be conceived. Our modern office and factory buildings are built on steel framework, our modern ships are practically all steel, the railroads and street car tracks are of steel, our automobiles contain practically all kinds

Ford's Campaign for New Money

By HAROLD HIGH

NEGOTIATIONS between the Ford Motor Company and a group of New York bankers for a loan variously reported to aggregate anywhere from $75,000,000 and $116,000,000 were said to be near consummation Monday of this week. By the time this page reaches its readers, announcement of the details may have been made. If it has not, it will be due in all probability to one of three reasons: Unwillingness of the Ford Interests to meet the conditions imposed by the bankers, with a resultant termination of the conferences; further delay in the negotiations, or the discovery by Mr. Ford of another source of money supply.

By making his corporation an exclusively family affair, Mr. Ford has been able to erect such barriers of censorship about the institution that if two or three years ago it were next to impossible to obtain from within the organization information about the progress of the business, it is impossible to do so now. What has leaked out lately about the problems Mr. Ford and his executive staff are being called upon to solve has not come out of the Ford offices, but rather from those on whom Mr. Ford has been obliged to call for assistance and co-operation in meeting the changed conditions in which he finds his corporation. Therefore whatever may be reported must be taken not only as wholly unofficial, but wholly uninspired as far as anyone in authority at the Ford plants is concerned.

But some of the reports which have been keeping the wires between New York and Detroit hot, the last 10 days come from sources which it is impossible to ignore. It is from these sources, and from men in Detroit whose relationships, either past or present, with the Ford Motor Company give their pronouncements weight, that what follows is written. The reader may take them as being as reliable as it is possible to obtain, and in no sense as more of the rumors, of which there is a new crop daily.

A newspaper dispatch from New York a week ago said that agents of the Ford Motor Company were in Wall street trying to arrange a loan of $50,000,000 to $75,000,000. According to the story, they had interviewed about every-

JOSEPH A. BOWER

body they believed would or could furnish the money, but had been turned down by one after another, among whom were certain men of Jewish blood, who are rankling under the unkind things Mr. Ford has been saying about their race in the columns of his Dearborn Independent.

However, if reports which came by wire from New York to Detroit Monday are to be credited —and it would appear that they should be, because of the nature of the business which made them necessary—the Ford representatives finally had succeeded in getting favorable consideration from the Morgan group, which includes, among others, J. P. Morgan & Company proper, the Liberty National Bank and the National Bank of Commerce in New York. J. P. Morgan & Company had issued no statement, but the National Bank of Commerce had denied to inquirers that the loan had been arranged. J. A. Bower, formerly vice-president of the Detroit Trust Company, but now vice-president of the Liberty National, and a Morgan lieutenant, refused either to confirm or deny that the loan had been made, as had been reported.

Mr. Ford was reported as maintaining that he could get along with $75,000,000, but it was said that when Edwin R. Stettinius, one of the Morgan partners, looked over the Ford balance sheet, he remarked that it was $116,000,000 that the company would have to have. To recall some of the recent Ford financial transactions and review some estimates of the company's present financial position is enlightening as bearing on the amount needed.

The general public has always had the idea that Henry Ford had such an unheard-of amount of cash on hand—as witness the fact that the banks declined to allow him to carry a checking account because of the huge figures in which he dealt—that at first it will be hard to

The Needs of the U. of M.

An Examination of the State's Physical Properties at Ann Arbor and the Proposed Construction Budget

By ALFRED FISCHER

NOTHING advertises government and governmental practice like heavy taxation. When the machinery is running smoothly and municipal, state and national officialdom worry along on nominal amounts raised by taxation, the average citizen can be aroused no more than by a week-old newspaper or the discovery of a new planet. But when the powers that be take the froth off his bank account, then put high priced steaths into his store, factory, warehouse and home to see what there may be that is further taxable, then he begins to sit up and take notice.

Just as we had a stone age and an iron age, we are now having a "sit-up-and-take-notice" age. It is characterized by heavy taxation and heavier spending of public monies, which, by the way, are coined in the same mints that produce private monies. There never was a time when every governmental unit had so many aspirations, wanted to do so much, and all of it at once. Part of this is due to the suspension of activities during the war, but more is due to "mob psychology." The various groups of officials figure that everybody is doing it, so it must be all right.

That is the state of mind in Michigan and intruding upon it comes the heaviest demand ever made in the history of the state from one of its most important institutions for a large building program. The University of Michigan has asked the 1921 Legislature for an immediate appropriation of $8,690,000, to be expended for additions and new buildings and equipment during this year and next. Then it wants an additional $10,000,000 during the next four years after the first amount has been provided. This is to be in excess of the money raised by the mill tax, which is for maintenance, and which in 1918 amounted to $1,241,500, according to the Michigan Manual. It is not at all impossible that the amount sought may be revised during the present session, because much of the money set aside by the 1919 Legislature for University buildings has been spent to maintain the various institutions and is no longer in the treasury. This latter condition hits the University of Michigan harder than it does any other state institution, for it has an unexpended balance for buildings of $722,000, which was allowed for a teachers' training school and for a new unit of the state hospital. The school building appropriation is for $250,000 and the hospital $472,000.

In his request for buildings, President Marion LeRoy Burton, of the University of Michigan, has not considered the danger of having previous appropriations being taken from him. His schedule submitted to the state budget commission covers eleven items, as follows:

Item No.	Name of Building	Requested for 1921-22	Requested for 1922-23
I.	First section of general building for Literary College	$ 450,000	$ 450,000
II.	Museum	450,000	450,000
III.	Engineering shops and laboratories	750,000	750,000
IV.	Physics laboratory	400,000	400,000
V.	Medical building	450,000	450,000
VI.	Completion of model high school	175,000	175,000
VII.	Addition to College of Dentistry	200,000	.....
VIII.	Chemical laboratory	200,000	200,000
IX.	Biological station at Douglas Lake	40,000	.....
	Totals	$3,115,000	$2,875,000
			$5,990,000
X.	Completion of University Hospital		1,500,000
	Total for buildings and equipment		$7,490,000
XI.	For purchase of land		1,200,000
	Grand total		$8,690,000

In addition, he has items on his desk of further needs in buildings and equipment which total about $10,000,000, which he hopes to get from the next two Legislatures, and which include the following proposals:

Fireproof law library building	$ 500,000
Home for nurses	750,000
Additional requirements for state library	55,000
Men's gymnasium	1,200,000
Storage facilities for coal	25,000
Boilers for heating plant	42,000
Warehouse	225,000
Connecting new hospital to heating plant	225,000
Additional elevators in old hospital	24,000
High pressure mains	12,000
Garage	1,200
Stores and wagon sheds	2,700
Fire station for campus	3,000
Fire protection system	17,000

Also several other items on which figures are still tentative, including dormitories for students, a hydraulic laboratory, a building for the Department of Architecture, and an administration building. None of the items in this second tabulation are in the requests for this year.

That is the schedule which Dr. Burton has prepared, after learning the wants of his various deans and from the heads of the colleges and from the regents. In putting them forward in the forceful manner he has, the attention of the entire state has been attracted to the University as nothing else could ever have done. Announcements from time to time during other years, that a university doctor had discovered a cure for leprosy, that models of German submarines were first tested in the University naval tank, that the germs of hookworm, sleeping sickness and other tropical diseases were first isolated and artificially bred on the campus, all stirred up the pride of the people of Michigan. But never until the taxpayers were asked to allow an additional tax levy of $1 each year for two years to provide needed buildings has the University become a subject of general discussion. The result has been that everybody with a theory of education, a grievance against the school for any of its minor policies and practices, or those most loyal to it from intimate residence or study, or from an appreciation of what it means to the country, is talking very loudly and expressing himself for the benefit of whomsoever will listen. It all comes back to our first premise, that taxation is a wonderful advertising medium.

To the person who visits the campus and many are doing so now for the first time—the fact that the University is run down at the heel becomes evident. There is concession, which is a temporary condition. But even if there were only half as many students in attendance, there would be need for at least $8,000,000 worth of buildings and equipment. It is not a matter of having pretty structures. The demands of the courses that must be taught well, and the ever expanding variety of subjects which must be taught in all departments, added to the wear and tear of daily use of equipment, create the problem. This is fundamental and must not be confused with other issues, such as increasing tuition for students from outside the state, and similar matters, which are being much discussed, particularly in rural centers. One of the least considered, but in the minds of many a most important factor in the situation, is the evidence that the curtailed facilities and the congestion on the campus have seriously interfered with graduate and research work. The under-classmen overrun everything, crowding out those who would like to go into seclusion with a germ or a theory and see what it has to tell mankind. This sort of deprivation exacts a serious penalty. It is only a couple of new buildings alone to relieve this condition.

One of Dr. Burton's most exploited but least forceful exhibits to legislators, editors and others whom he has invited to observe the situation at first hand is the University Hospital. It is predicted here that when the grand fight for his appropriation finally is made the next order of business at the Capitol, this will prove his Old Man of the Sea. University Hospital is exhibited as a sort of chamber of horrors, where insufferable congestion is displayed in all departments, and the fact set up that because of the tremendous crush of cases going through all the time, it is impossible to keep the place clean.

Now the University of Michigan hospital is a hybrid institution. It is at once a state hospital where people without means may come for free treatment. It is also a teaching hospital, where indigent cases are cared for while students may study. The standards of a teaching hospital, unfortunately, have never been as rigid in matters of sanitation and cleanliness as they might have been, nor is the same attention given to detail and personal service for patients as in so-called closed hospitals or other private places. This is no brief for closed institutions, which are not a part

AUTO CLUB ACTIVITIES STARTED

The Flint Automobile Club organization has been completed and the charter members number 300. Besides the main office of the club in a business building, a touring bureau will be opened in Hotel Durant. Dallas W. Marshall was chairman of the club's organization committee.

The Lansing Automobile Association will open offices and a touring bureau in Hotel Kerns some time next month.

PAPER MILLS CUT WAGES

Six of the 12 paper mills in Kalamazoo have reduced the wages of employes an average of 17 per cent which cut corresponds to the voluntary increase granted last May.

LOGGING OPERATIONS CURTAILED

Reports from Houghton are that there has been a drastic curtailment of logging operations in the Upper Peninsula, due to the slump in the market for lumber. Although lumbermen throughout the northern peninsula look for a steady market for the product later in the year, there is said to be little or no demand for lumber at this time, despite a reduction of from 35 to 40 per cent in prices. A smaller number of camps are operating than for several years, although the amount of lumber on hand is said by operators to be below normal.

Wages of men employed in the woods have been reduced from $70 and $90 a month to $40 and $50. The supply of labor is said to be ample.

How Michigan Casts Its Metal

Something About the Methods Used Making Castings In State Which Ranks Fifth in This Line of Enterprise

LOAM MOLD MADE BY RUSSEL WHEEL & FOUNDRY COMPANY FOR HUGE DETROIT EDISON COMPANY CASTING
At the left the core is shown in process of construction. In the center it is shown finished. At the right is the completed casting.

By HOWARD CAMPBELL

IN THE TWO YEARS from October, 1918, to October, 1920, there were put into operation in Michigan 45 new foundry enterprises, bringing the total of such establishments in the state to 388 and giving Michigan fifth rank among all the states of the Union in this respect. Pennsylvania is first, with 803; Ohio second, with 688; New York third, with 582; Illinois fourth, with 484, and Wisconsin sixth, with 367.

Detroit ranks fourth among American cities in foundry enterprises, having a total of 122. Chicago is in first place, with 194; New York second, with 125; Cleveland third, with 123, and Philadelphia fifth, with 100.

The gain made by Michigan in the last two years is the largest both in numbers and percentage. Thus the Wolverine state has forged further to the front in another line of industrial endeavor, offering still greater possibilities for the employment of men and equipment in this field.

Although the automotive industry has caused the concentration of foundries in three or four of the principal Michigan cities—Detroit, of course, being the leader—such plants are to be found in almost every city of any size. Some of them give employment in hundreds of men; others, located in the smaller centers, employ only a few, but each in normal seasons, be its output large or small, finds a ready and constantly expanding market for its product.

Two of the largest malleable iron castings manufacturers in the world are located in Michigan. One is the Albion Malleable Iron Works, at Albion, which employs 1,200 men and turns out 250 tons of castings daily. The other is the Michigan Malleable Iron Company, Detroit, which employs a force of more than 1,200 men and produces in excess of 100 tons of castings every 24 hours.

Among the concerns producing aluminum and brass castings, the General Aluminum & Brass Manufacturing Company, Detroit, is one of the foremost, with an output of 25 tons daily. Another leader in the Aluminum Manufactures, Inc., Detroit, with a daily production of 65 tons. The Charles B. Bohn Foundry Company, Detroit, produces 15 tons of aluminum and 15 tons of brass castings daily.

Among the producers of steel castings, the Detroit Steel Castings Company stands well toward the top, with a daily capacity of 50 tons. This company employs about 500 men. The Wilson Foundry & Machine Company, at Pontiac, is a large producer of gray iron castings, turning out from 300 to 350 tons every twenty-four hours. Between 1,200 and 1,300 men are employed.

In addition to these, which do work on contract for corporations using castings, are the concerns with foundries for producing their own castings. Among the foremost in this category are those of the Ford, Packard and Cadillac motor car companies and the Michigan Stove Works (largest concern of its kind in the world) and Detroit and Peninsular Stove companies, all of Detroit.

Michigan is in a fortunate position as regards the supply of raw materials for the foundry industry by reason of its extensive iron and copper mines. Considerably more than half the ore consumed within the state is mined within its borders.

To begin at the beginning, founding is the art of making metal castings. It consists in preparing molds, mixing and melting the metals, pouring the metal into the molds and removing the castings from the molds and cleaning and preparing these castings for the machine shop.

A great many of the iron commodities with which we come in contact every day are produced in this manner. Automobile cylinders, flywheels and pistons, stoves, steam radiators, sewing machine frames, typewriter frames and a multitude of other articles are poured from the molten metal.

Studies of the most ancient and primitive ruins indicate that the metallurgy of copper, tin and iron was practiced in its crudest form in the earliest periods of man's development. On account of the ease with which it is worked, copper was probably the first to be used. Copper objects appear in the pre-historic remains of Egypt and bronze articles have been found which, according to the best authority, date from the Fourth Dynasty (from 3800 to 4700 B. C.); and the earliest of recorded history states that Tubal Cain (3875 B. C.) was a "master in every kind of bronze and iron work." Reliefs have been found dating as far back as 3700 B. C., showing that furnaces and bellows, however crude they may have been, were a part of the foundryman's equipment; and crucibles have been found among the ruins on the Sinai Peninsula.

However primitive they may have been, the methods employed by this "master" and his coworkers were the foundation of an industry which has always been and will always continue to be of prime importance in the commercial field. That this branch of industry should increase in size and importance in Michigan is a natural sequence of the extraordinary growth of the metal working industries in this state.

In the manufacture of modern machinery four classes of castings are employed, each having its individual physical properties. These are gray iron, copper and its alloys (including brass and bronze), aluminum and mild steel. By far the greater number of castings

Digitized by Google

are made of gray iron—that is, iron which may be machined directly as it comes from the mold, without further heat treatment. This is due not only to the fact that gray iron is the most common and therefore the cheapest of all metals, but also because it is comparatively easy to machine. Brass or bronze are usually employed for the manufacture of parts which either have to come in contact with liquids, or for the making of parts which, because of their peculiar construction, would be easily broken if made of iron. Iron is rusted by water and literally rotted by oil, while the copper alloys are affected by neither; nor are they as brittle as iron.

The first element to be taken into consideration in the making of a casting is the pattern. This is a counterpart of the casting wanted and is usually made of wood, although if a large number of castings are to be made from the same pattern, it is often made of iron, brass or aluminum. The making of the more complicated patterns requires skillful workmanship, as allowances have to be made for the shrinkage of the different kinds of metals in cooling, the problem of setting cores has to be solved, etc.

The pattern having been made, the next step is to prepare the mold from it. Molds in which metal is cast may be made in different ways, but the results are always the same. The common method of forming these molds is to pack molding sand around a pattern of the same shape as the casting that is to be made. The pattern is then drawn from the sand, thus leaving an impression, or mold, in which the metal is cast.

"Pouring Off" in the Packard Foundry

Three Kinds of Sand Used

For the making of molds three different kinds of sand are employed—green sand, dry sand and loam. Green sand molding is the making of castings in molds which are composed entirely of sand in a damp state. Dry sand molding involves the making of castings in molds made of sand in a damp state, after which the sand is dried in an oven or otherwise, so as to make the mold solid and firm. Loam molding usually is done where very large castings are to be made, a mixture of loamy sand and other material being used to form the face of the mold, brickwork forming the supports. This form of mold also has to be thoroughly dried before the metal can be poured into it.

The green sand mold is most commonly used, as it involves the smallest amount of time and expense and is good enough for the usual forms of castings. The mold is formed in a frame, or box, made of wood or metal and having neither top nor bottom, and called a flask. It usually is made in two parts, the upper half being called the "cope" and the lower part the "drag." The "follow board" is the board on which the pattern is placed while the mold is being made, and the "bottom

STRAIGHT LINE METHODS

ERNST & ERNST

—have installed Straight Line Methods of Accounting and Cost Finding in more than 1500 industrial plants. Each will testify to entire satisfaction in the service. The executives of each will emphasize the fact that Straight Line Methods assure them at all times exact knowledge in all departments of their business—factory and office, buying and selling, production, maintenance, overhead—and that they have gained from the service better organization, better system, larger profits.

The definite value of Straight Line Methods is due to the accounting skill and practical engineering experience of each member of our several System Staffs. Their intimate knowledge of the problems in business organization and management has been gained through their application of Straight Line Methods in varied lines, nation-wide in scope and over a period of many years. Our Central Clearing House and Research Department, devoted to acquiring the most authentic figures and methods, coordinates this knowledge and makes it available to individual needs; thus assuring a broad, comprehensive view-point, and one which is totally unbiased.

(*Continued from Page 11*)

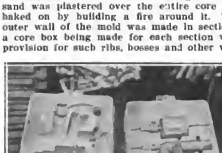
board" is the board on which it rests after being turned over. The first operation is to place the drag on a bottom board, then set the pattern as near the center of the board as possible. The drag is then filled with sand which is "rammed" or pounded down as solid as possible. The sand must fill the flask level with the top. Then the follow board is placed over the mold and it is turned over, which brings the pattern to the top. Fine, dry sand called "parting sand" is now sprinkled on the mold and the cope is set on. This is also filled with sand and rammed, more sand being added until the flask is full. A hole is made down through the sand in the cope with a "sprue pin," so that the metal can be poured into the mold. A number of fine holes are made down through the sand with a wire to serve as vents for the escape of gases when the metal is poured, and the cope is then lifted off.

If it is necessary that a recess or hollow space be left in the casting, a core must be used. A core is made of sand mixed with a "binder" of oil or molasses, shaped to the size and dimensions of the hole required, and baked so that it may be handled without breaking. The making of cores, while apparently quite simple, really requires a considerable amount of skill, with the result that this branch of foundry work has developed into a trade in itself. Cores of some regular shape, such as round, square, hexagonal, etc., may be made in core machines, which force the mixture through a tube of the required shape. Cores of irregular shapes and sizes are made by molding the core sand in a core box, which is usually a wooden box of the required shape and size. Long, slender or heavy cores which might otherwise be broken have iron rods molded into them to give them additional strength. Dry sand molds and large cores are dried or baked in ovens in which the temperature is from 300 to 400 degress Fahrenheit.

ROLL-OVER MACHINE IN PACKARD MOTOR CAR CO. FOUNDRY

This machine is used to make crank case castings. The photograph at the left shows the completed mold ready to be turned over. At the right the mold has been deposited on the floor and the machine table, together with the pattern, has been withdrawn. The machine is operated by compressed air, the workmen in the right hand picture being at the controlling device.

The cores are placed in position at the points where the holes or recesses are desired, and the flask is put together again. Then when the liquid metal is poured in through the gate in the cope, it fills the depression or mold left by the pattern and flows around the cores. The metal "sets" or becomes solid again very quickly, after which the cope is taken off, the casting is pulled out of the sand, the cores broken and shaken out of it and the casting left to cool.



Although until very recently the making of molds has been done by hand, the last few years have seen the development of machines which perform some of the operations more or less perfectly. Some of these machines are constructed for "ramming" the sand, while others are used for drawing the pattern. They are called ramming machines or pattern-drawing machines accordingly, and machines which combine these operations are called combination machines. Such machines are especially well adapted for the production of castings that are to be produced in large quantities. No very definite line can be drawn between work that can be economically done on a molding machine and that which cannot. The kind of machine must also be considered in deciding whether a mold can be made economically by machine, as each machine has its own limitations. The vibrating type of machine known as "squeezer" rams the sand by squeezing the mold, but it cannot pack the sand beyond a certain depth. However, there is no limit to the depth of mold than can be jolt-rammed. Squeezers are suitable for molding flat articles, such as builders' hardware, stove-lids, wrenches, etc., while the jolt machine is used for making molds which are either too large or too deep to be handled successfully on a squeezer.

Some Installations

The Atlas Foundry Company, Detroit, uses a combination machine for making Maxwell transmission cases. This machine jolts, squeezes and strips or draws the pattern. The pattern plate in this case is fastened to the machine. The flask is put on and filled with sand, which is packed by jolting. As it settles down, more sand is added until the flask is full, after which an extra amount of sand is added, the squeezer head is brought forward and the mold is finally packed by squeezing. The mold now being completed, the squeezer head is pushed back and the mold is raised automatically from the pattern. The mold is then removed from the machine, which is then returned to the original position. The whole operation takes less than a minute. At the present time six men and one machine are making 200 of these molds a day. The machine operates by compressed air at 80 pounds pressure.

A "roll-over" machine is used by the Packard Motor Car Company for making crank case molds. In this case also, the pattern board is clamped to the machine table, which serves as a follow board for the flask. The flask is set on to the pattern board and filled with sand, which is tamped by jolting. When the flask is full, a bottom board is clamped on and the machine table automatically turned over, depositing the flask on the floor at the opposite side of the machine. The table, together with the pattern, is then raised from the mold and rolled back to its original position. The Packard company makes 60 of these molds daily on one machine.

The process of making a cast iron condenser casting, as was recently done by the Russel Wheel & Foundry Company, Detroit, is a good example of loam molding. As is usual in making a casting which is wholly or partly of circular shape, the first operation was to set up a "sweep" or gauge, with which to determine the outline of the casting. A brick wall was then laid for the core or inner wall of the mold, the wall being built to a true circle by swinging the sweep arm around as the bricks were laid. Additional brick frame work was then built, following out the design on the casting, after which a coating of loam sand was plastered over the entire core and baked on by building a fire around it. The outer wall of the mold was made in sections, a core box being made for each section with provision for such ribs, bosses and other variations as occurred in the outer surface of that section of the casting. These sections were made of sharp or dry sand, mixed with oil for a binder, and containing iron rods to make them more solid. After forming in the core boxes, the sections were baked to make them solid so that they could be handled. Then these sections were put together, making a solid wall eight inches thick around the core, with just enough space between the core and the wall for the thickness of the casting, allowance being made, of course, for shrinkage. A core plate, or a huge plate made with an iron framework faced with loam sand and baked, was then put over the top and the mold was complete. The iron was poured into two gates at the same time, both being at the bottom of the mold and on opposite sides. Where a mold is gated at the bottom, the metal is poured from the top, but through a separate channel connecting with the gate at the bottom of the mold, so that the metal will run into the mold on an angle. Deep cylinders and other castings of this type usually are gated in this manner, because if the metal were poured in through top gates, it would splash at the bottom and cut through the mold.

COMPLETED MOLD FOR CARBURETOR CASTING

This photograph shows the mold open, with the core set in place. In the foreground is a finished casting.

Cupolas

The furnace generally used for melting the iron is known as a cupola, and consists of an iron shell lined with firebrick. Cupolas usually are made from three to seven feet in diameter inside the lining, although cupolas as large as ten feet in diameter are in use in some of the larger foundries. Near the top of the cupola is the charging gallery, where the fuel and iron are loaded in, and at the bottom is the tap hole, by which the molten iron and slag are run off. The amount of heat required to melt the iron is obtained by forcing a blast of air in through a row of openings situated a short distance above the bottom of the cupola.

The operation of the cupola is begun by lighting a bed of coke and coal, more fuel being added as rapidly as possible. When the fire is up to the level of the afholes, a blast of air is forced in and the temperature rises quickly. Then the charging is begun, iron and coke being added in alternate layers. At first the tap is left open, but as soon as the metal

Rules to Follow in Filing Tax Returns

Recent Treasury Decisions on Income Reports

RECENT Treasury decisions affect materially returns of income taxes which will be made by business men for the year 1920. Among the more important is the decision in relation to valuations of inventories, in accordance with which a taxpayer may, regardless of his past practice, adopt the basis of "cost or market," whichever is lower," for his 1920 inventory. In his return the taxpayer must state that it represents a change from his former basis. Thereafter, changes can be made only after permission is obtained from the Commissioner of Internal Revenue.

In the case of a merchant, "cost" means the invoice price less trade or other discounts, excepting strictly cash discounts approximating a fair rate of interest, which may be deducted or not at the option of the taxpayer, provided a consistent course is followed. To the net invoice price should be added the cost of transportation and other necessary charges incurred in acquiring possession of the goods.

In the case of manufacturer, "cost" means the cost of raw materials and supplies, expenditures for labor and indirect costs incident to production, including a reasonable proportion of management expenses, but not including any cost of selling or securing return on capital.

"Market" means the current bid price prevailing at the date of the inventory for the particular merchandise. The burden of proof as to the correctness of the price rests upon the taxpayer in each case. Where no open market quotations are available, the taxpayer must use such evidence of a fair market price at the dates nearest the inventory as may be available, such as specific transactions, or compensation paid for cancellation of contracts or purchase commitments. Where, because of abnormal conditions, the taxpayer has regularly sold such merchandise at prices lower than the market bid price, the inventory may be valued at such prices. The correctness of the prices will be determined by reference to the actual sales of the taxpayer for a reasonable period before and after the date of inventory. Prices which vary materially from the actual prices so ascertained will not be accepted as reflecting the market. In such instances the penalties prescribed for filing false and fraudulent returns—a fine of not more than $10,000 or one year's imprisonment or both, together with the cost of prosecution and an added assessment of 50 per cent of the tax—may be asserted.

The value of each item in the inventory may be measured by cost or market, whichever is lower. An entire stock may not be inventoried at cost and also at market price, and the lower of the two inventories used. Inventories on whatever basis taken will be subject to investigation by the Commissioner of Internal Revenue, and the taxpayer must satisfy the Commissioner of the correctness of the prices adopted. He must be prepared to show both the cost and the market price of each article included in the inventory.

Business enterprises for the purposes of the income tax may be divided into three classes: those engaged in making, those engaged in producing, and those engaged in trading. To these may be added another class which neither produce, make nor trade, but render what may be designated as business service, such as transportation, storage, livery and garage service, in which case the gross income would be the total amount received or earned.

In mercantile accounting the gross profit for a given period is obtained from a group of accounts known as trading accounts, consisting of inventory, purchases, sales, freight, returns and allowances, and in certain cases discount and freight charges outward. Discount should be charged or credited to the distribution accounts of the business. Freight outward should be considered a selling expense.

There are three elements which enter into the cost of a manufactured product—cost of material, cost of labor and manufacturing expense, sometimes called overhead. The first and second elements go to make up the prime cost of manufacturing. Gross income in such business means total sales less the prime cost of goods sold. Treasury regulations provide that in determining gross income, subtractions should not be made for depreciation, depletion, selling expenses or losses, or for items not ordinarily used in computing the cost of goods sold.

The Revenue Act provides for the deduction of business expenses. Among the items to be treated as business expenses are material, labor, supplies and repairs in the case of a manufacturer, while a merchant would include his purchase of goods bought for resale. In either case the amount to be taken as a deduction for the year 1920 should be determined by

Michigan and the Open Shop

Employers Are Not Opposed to Unionism As Such, But Are Insisting Upon the Freedom of Contract

By F. W. HERSEY

SINCE the establishment of the United States Railroad Administration there has been in existence a National Adjustment Board, located in Washington, where all disputes arising in the relationships of railroad owners and rail workers gravitate for settlement. Months ago the United States Railroad Administration went out of existence, but the National Adjustment Board continues to flourish. The railroad employer has but nominal jurisdiction over his employes.

If some breach of discipline or some act of gross carelessness justifies the discharge of a worker, and that worker happens to be a member of a railroad brotherhood, as practically all of them are, it is more than likely that the local to which the discharged worker belongs will seek to have the case brought before the National Adjustment Board. If the local is successful in this effort, the railroad concerned must have its witnesses in Washington for the hearing on the case.

The Bone of Contention

The establishment of the National Adjustment Board was the result of an agreement between the railroad brotherhoods and Director General McAdoo, during the war period, which provided that all grievances of the rail workers should be given a hearing and just treatment accorded. The Government fostered such an agreement simply to prevent strikes and keep the carrier system in operation at a time when disaffections would have been serious.

Now that the war is over, the railroads are back in the control of their owners, and as relations between employer and employe in this country have been always regarded as of no direct concern to the state or national governments except in great emergency, the railroads, naturally, desire that the National Adjustment Board follow the Railroad Administration into oblivion.

On the other hand, the railroad brotherhoods, realizing what a powerful weapon the National Adjustment Board is, have set their machinery to work to keep this board, or a similar organization, in existence. The new Transportation Act plays into their hands inasmuch as it provides that such national agreements may be made if desired, but are not compulsory.

The drafting of such an agreement, or the establishment of a national adjustment board, assuming the present one was eliminated, would be departing from all traditions in American industrial life. Manufacturers and railroad men throughout the country are opposed to any such agreement as well as to the establishment of any national adjustment board.

Lovett at Chicago Conference

For the purpose of getting the views of industry at large on the subject in concrete form, representatives of the state manufacturers' associations met in Chicago a week or so ago for a conference. At this meeting not only the plan of the brotherhoods for national jurisdiction over rail labor disputes, but also the problem of the open shop and immigration restriction were discussed. Three resolutions were adopted.

One was in the form of a protest against the continuation of the National Adjustment Board or the formulation of any agreements which would remove the control of labor policies from the jurisdiction of railroad employers. The second expressed the opinion of the manufacturers that closer supervision of immigration should be conducted and that the national legislature should appropriate sufficient money to make such supervision possible. The manufacturers recognized that with the present limited foreign consul organizations a proper supervision of immigration at its source was impossible. The third resolution was to the effect that manufacturers would encourage freedom from contract between workers and employers. There was nothing in the resolution indicating opposition to unionism.

John L. Lovett, general manager of the Michigan Manufacturers' Association, attended the conference as spokesman for the manufacturers of this state, who are advocates of open shop conditions without being opposed to labor organizations. Mr. Lovett discussed in a general way the concensus of opinion among association members concerning the open shop.

"This seems a queer time to talk about closed or open shop, or any of the other problems of the relationship of employer and employe," he said. "There is not a great deal of business for anybody, and far from enough work. On the other hand, what better time to give thought to labor and every other problem which has affected industry in the past and will have some influence in the future.

"The talk of making Detroit a closed shop city, and eventually all of Michigan is brave talk. Any talk of eliminating present closed shops and forcing the open shop into general acceptance is equally brave—and equally futile. There always will be open shops and closed shops, but it is not the intention of the manufacturers of this state to stand quietly by and allow present day union labor leaders to turn this state into one huge closed shop.

Want Freedom of Contract

"The stand our association takes is that the freedom of contract shall remain inviolate; that the employer shall have the right to employ workers and pay them according to their ability to produce, regardless of what lodge, church or union they may belong to, and that the workers themselves shall have the right to work where they please, how they please and under what terms they please, and that they shall be unmolested by organization officials.

"I fail to see how closed shop conditions could improve the status of workers in this state. The percentage of employes organized is very small, yet despite this fact it is widely known that the highest wages and best conditions anywhere in this country obtain in Michigan. Labor has had no small part in the rapid industrial development of the state, but unionism has been a negligible factor.

"Men have flocked here from all over the country, attracted by the high wages and good working conditions, which would indicate that the open shop policy, which prevails, is not so objectionable to the workers. In fact, manufacturers are convinced that many labor organization activities of the last year or so have not been so much the expression of the will of the workers as the evidence of the autocracy of questionable leadership.

"I am one of those who believe implicitly in the integrity of the majority of workingmen and women. I believe they still take pride in the productive ability in the quality of their work, and have an ambition to get ahead. When we talk about the employers of Michigan we are not discussing men who have inherited industrial leadership without a personal effort in its development. Most of the men we recognize as employers of labor in this state came up from the works.

"Do you realize that nine-tenths of the pattern shops and machine shops in Michigan are owned by men who graduated from the bench and machine by their own efforts? It is a fact that numbered among present employers of labor there are not a few former union men and quite a number of former union officials, and I notice they operate open shops.

The Bricklayer's Story

"While I was in Grand Rapids recently I listened to the story of a veteran bricklayer, one of those men who made bricklaying more than a day's work for a day's pay. To him it was almost an art. He achieved and held the title of champion bricklayer of the state, if not of the country. If I were to mention his name almost every building contractor of long standing would instantly recognize it. This

For Filling a Tank

NOW that the railroads have been restored to control of their own properties, it is interesting to learn of incidents close to home in which the unions and their agents during Federal control worked hardship and unnecessary expense on the roads.

An incident is reported which concerns a man who owned a few acres of land close to a water tank at a point on the Pere Marquette between Saginaw and Ludington. His duties for the railroad were merely to start a gasoline engine about 10 in the morning, let it run 20 minutes and then shut it off when the tank was full of water. Perhaps he would be obliged to start the engine again after dinner in the evening, but, all told, the actual time he spent on the job was trifling. Yet the railroad paid him $60 a month and he was satisfied, for he could tend his small farm notwithstanding.

One day along came a government inspector, appointed by McAdoo but really selected by W. G. Lee. After learning that the pump tender's duties involved some work at 10 a. m., and again about 7 p. m., he was aghast, and decided that he should have pay for regular eight hours' work, with one hour overtime for working after 6 p. m. Result: The farmer afterward received $122.83 a month instead of $60 for the same work, and about $1,300 back pay.

Bills Begin to Put in Appearance at Lansing

The state legislature is beginning to get down to business. The first of the long list of bills are making their appearance. A step toward carrying out the centralized government program of Gov. Groesbeck was taken last week when two bills were introduced providing for a central administrative board and transferring to the auditor general nearly all of the state auditing.

Rep. William O. Lee, Port Huron, offered a bill to provide punishment for house or apartment owners who refuse to rent their property to families with children—a fine of $500 or 90 days in jail, or both. Senator Herbert F. Baker wants an investigation of the Patriotic Fund as handled by the Community Council Commission. A house bill calls for the repeal of the law that created the commission.

Rep. A. B. Glaspie, Oakland county, has introduced a resolution urging the Michigan delegation in Congress to seek federal legislation returning power over the railroads to the state.

Because of the colder climate and longer winter, with less time in which to use automobiles, Rep. Robert B. MacDonald, Houghton, seeks to reduce the automobile license to three-fourths of the rate, for owners north of Mason, Lake, Osceola, Clare, Gladwin and Arenac. Among the other bills and resolutions introduced last week are: A bill making it a felony to steal automobiles, with a maximum penalty of 25 years in state prison for each offense; resolution asking Congress to repeal the Esch-Cummings railroad bill, and a bill permitting incorporated villages to bond to exceed 5 per cent of their assessed valuation.

Rep. Joseph E. Watson, Branch county, introduced a bill to amend the banking law whereby smaller state banks will be given authority to act in a fiduciary capacity such as administrator, executor, guardian or trustee of an estate, or any other trust capacity. The bill empowers the banking commissioner to grant such jurisdiction, and, if dissatisfied, the banks may appeal to a board composed of the governor, auditor general and state treasurer for a final decision. The stockholders would be held liable to double the extent of their capital stock. The big trust companies of the state may oppose the proposal.

A CORRECTION

On page 38 of our issue of January 15 it was stated that the Detroit branch of the Crucible Steel Company of America had moved from 1326 Woodbridge street east to 1437-59 Franklin street. This was in error, the business which made the change in location being the Atlas Crucible Steel Company, which has its headquarters in Dunkirk, N. Y., and manufactures high speed and carbon and alloy steels, and drill rod, etc. The purchase of the Franklin street property will enable the Atlas company to have twice its present warehouse space, necessary in the proper handling of a rapidly increasing business. The removal from the old to the new quarters will be accomplished by February 1, after which all business will be conducted from the new address.

LINCOLN HIGHWAY OFFICIAL RESIGNS

F. A. Selberling, president of the Lincoln Highway Association, has resigned and is succeeded by J. Newton Gunn, president of the United States Tire Company. G. S. Hoag is made field secretary. Paul H. Deming, Detroit, and H. F. Campbell, Indianapolis, resigned as directors. W. O. Rutherford, Akron, O., was elected a director.

HAYNES CO. REPORTS SALES

The Haynes Automobile Company, Kokomo, Ind., reports that at the New York show contracts for 4,000 cars were made with dealers, distributors and customers.

Detroit Notes Improvement

But Ford and Dodge Inactivity Remains Big Factor; Wage Question is a Serious One for the Employers

By MARC BRAUN

IMPROVEMENT in the labor and manufacturing situation in Detroit as well as elsewhere in the state has been recorded during the last week, but business men say there cannot be very much of an advance as long as the Ford Motor Company and Dodge Brothers remain closed.

"More than 60,000 of the probable 120,000 to 140,000 men now idle in the city are Ford and Dodge workers," said a city official. "Of the remaining unemployed it is certain that about half will be able to return to work, not necessarily the next day, but a few days after Ford and Dodge resume. There are several establishments employing more than 1,000 men each which have been practically closed ever since Ford closed, and which have let it be known that they will reopen when Ford goes back to work."

It may be added that outside Detroit, in other Michigan cities, there are many people idle, directly due to the fact that the Ford Motor Company is closed or because the company gave stop orders in December when it closed. It is said that quite a number of concerns are more or less in the same situation owing to the Dodge shut-down.

During the week ended January 22, some 1,500 men were added to the working forces of the 79 concerns reporting labor conditions to the Employers' Association of Detroit. At the end of the week the records showed a total of 34,466 men employed in these plants, 17,013 working at the rate of 34 hours a week. It is quite likely that during the present week several hundred more men were called back—perhaps even more than last week, but a number of works managers stated that while they were adding men, they were going about it deliberately.

Quite a number of the automotive factories also made it known that beginning with the week of January 31 they expected to put on men, and that if the Chicago show, the first week of February, gave fair results, they probably would bring their personnel up to above 50 per cent of normal. One concern, the Detroit Pressed Steel Company, intends to reopen February 1 with 500 to 600 men. This is the most important announcement among several.

A matter which is being more freely discussed now than in some weeks past is that of wages at the Ford and other automobile plants. Officially nothing on the subject has been given out, but in various quarters it has been heard that the wage matter has been gone over carefully by Ford officials. It is said in labor circles that the Ford company is not likely to pay its men the minimum of $7 a day, as was the case last year, when the plant again starts operations but that $5 a day will be the minimum scale. However, as stated above, this information does not come from Ford officials.

A labor leader said a few days ago that he had been informed that very recently some of the principal employers of the city and the employment managers of their plants held a meeting at one of the clubs and freely discussed the wage question. He said that it was the opinion of the majority present that there was no likelihood of great improvement in the industrial situation until the war-time wages had been cut down to something near the pre-war level. Reductions mentioned, he added, ranged from 10 to 20 per cent and in some cases 25 per cent. It is known that already wages have been considerably reduced in some establishments, but here again it was said that whatever action the Ford and Dodge officials take will have a deciding effect upon all other employers.

This labor leader said that a great many working men realize that war-time wages cannot consistently prevail now and they also know that while living costs have not yet decreased as much as desirable, there is a noticeable decline, which is bound to continue. The one big item which has least decreased thus far is rent. The most noticeable reductions were said to be in the prices of clothing, shoes, shirts and similar necessities. Prices in many restaurants are down to pre-war rates; prices of food products bought on the markets are also much lower than what they were.

RECK MANAGES SCHWARZE ELECTRIC

P. C. Reck, superintendent of the Schwarze Electric Company, Adrian, has been appointed acting general manager to take the place of D. E. Sampson, who has resigned but who remains a stockholder and a member of the board of directors. It has been announced by Mr. Reck that the general policy of the company will be continued. The plant has reopened with about 25 per cent of its normal force.

FENN ESCAPES DEPRESSION

The Fenn Manufacturing Company, Charlotte, which makes scythe snaths, has not felt the effects of the general business depression. As a matter of fact, its officials state that the plant has been and is running with a full force and that no cancellations have been received. Domestic business of the company continues to expand and the export part is increasing. Recently an order was received from England, on which a carload with 830 dozen scythe snaths has been shipped.

HARBOR COMMISSION PROPOSED

For the port development committee of the Detroit Board of Commerce Capt. William H. Adams has drafted a recommendation that a harbor commission be established for Detroit, Wyandotte, Ecorse, Trenton, River Rouge and Oakwood by legislative act, this commission to plan and supervise the condemnation of land, construction of wharves and the collection of harbor taxes and dues. The city plan commission has a counter proposition providing for the appointment of a Detroit harbor commission to be appointed by the city council.

MASON CONTRACTORS ELECT

The Mason Contractors Association of Detroit has elected the following officers for 1921: A. H. Aldinger, president; T. W. Widenmann, vice-president, and W. H. Whittingham, treasurer. R. A. MacMullan has been reappointed secretary.

M. P. A. TOUR PLAN APPROVED

Directors of the Michigan Pikes Association have approved Tour Manager W. D. Edenburn's plan for the "Around Lake Superior" annual run, to start in July and continue 15 days.

FURNITURE SHOW SALES

It is reported from Grand Rapids that during the recent annual January furniture show approximately $1,730,000 worth of furniture was sold, or in other words that each of the 1,730 buyers ordered an average of $1,000 worth of goods.

Digitized by Google

Saginaw Automotive Plants Getting Ready

The various units of the General Motors Corporation in Saginaw are gradually coming back into production. Four hundred men are at work at the engine plant—about one-fourth of normal; about one-fifth of normal, 100 men, are at the malleable plant; the foundry has 10 to 15 per cent of its usual force, while the steering gear plant, the Jacox, is not yet in operation. Its opening may be delayed until the middle of February.

There seems to be no doubt that the future looks good to the GMC, inasmuch as it has just been made known that the corporation has purchased an entire city block—the one bounded by Hamilton, Niagara, Winton and Throop streets—near the Jacox plant. While no definite announcement has been made as to what will be done with this property, it is the opinion in the city that upon it will be located an addition to the Jacox factory.

However, it is not only the GMC which is looking up. The Erdman-Guider Company, closed body builder, which has also a plant in Detroit, is making preparations for an immediate increase in production, this being the direct result of the New York show. A. R. Guider while at the show wired his associates in Saginaw as follows:

"The New York automobile show has been a real success and the results exceed those anticipated by the most optimistic exhibitors. Sales have been better than at previous shows and the general feeling voiced at the meeting of the National Automobile Chamber of Commerce by the vice-president of the Guaranty Trust Company is that the depression in the automobile industry is rapidly passing.

"The manufacturers for whom Erdman-Guider Company build closed bodies, including the Cadillac, export Paige, Saxon and Columbia, report unusually good business, and we expect immediate orders to increase our production under present contracts which we have with those companies. The Saxon company has closed a new contract for 1,000 cars in one state alone, and reports that the closed type of car, the bodies of which are manufactured at our Saginaw plant, aroused much complimentary interest at the show.

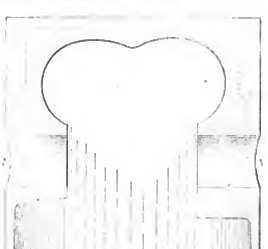
"The company has received several inquiries to close on new contracts, deliveries to commence at once. And we anticipate that one of these contracts will be opened next week."

When running with a full force the company employs up to 400 men.

AINSWORTH'S NEW PRODUCT

The Ainsworth Manufacturing Company, Detroit, has brought out a special amber-colored visor for windshields, which protects the driver from the glare of the sun but does not interfere with clear vision.

STEEL TREATERS MEET



The January meeting of the Detroit chapter, American Society of Steel Treating, was held Thursday evening of this week at the Board of Commerce building. A. F. MacFarland, metallurgical engineer of the Vanadium Alloy Steel Company, presented an interesting paper captioned "Some Notes on the Heat Treatment and Structural Characteristics of High Speed Steel."

LA BELLE IRON PICKING UP

The La Belle Iron Works, Steubenville, O., is now running 25 per cent of normal and is expected to increase the run steadily, the outlook being considered favorable.

HOLLAND ENGINE PLANT SOLD

The plant of the Holland Engine Company has been sold to a company incorporated at $50,000. This property has been in a receiver's hands.

MOTOR PISTONS

Automatically Drilled—Two-at-a-Time

Piston-drilling practice at one of the leading automobile plants involves the use of "NEW BRITAIN" Multiple-Spindle Automatic Chucking Machines of the "Doubled" type. Many advantages are the result.

Production—210 pieces per hour, down time averaging less than five per cent.
Drilling both holes simultaneously means *double* drill press production; doing two pistons at once increases this to *four times*, and the provision of idle chucks, enabling work to be removed and replaced while drilling is in progress, still further enhances production by the "New Britain" method to *five or six times* that of the drill press.

Skilled labor is not required for the successful and efficient operation of these machines. There are no heavy jigs or fixtures to handle, such as are necessary where work is done in a drill press.

The drills operate horizontally and readily clear themselves of chips; whereas if operated vertically there is a tendency to clog and the tool becomes dull quite quickly.
The turret fixture which holds the pistons is fitted with guide bushings which insure accurate alignment of the drilled holes whether drill spindles are in absolute alignment or not.

Machines may also be fitted to drill and ream at one setting. If you make pistons you'll want to know more about the "New Britain." Write today.

SOME MOTOR SALES INCREASES

The Buick Motor Company, of New York, has announced that during October, November and December, 1920, it delivered a total of 2,538 Buicks, valued at $5,234,024, which breaks all its former sales records from October to January. The Reading Automobile Company, Reading, Pa., which sells the Buick and Dodge cars, states that during November and December, 1920, more of these cars were delivered than during any corresponding period in the twenty-two years of existence of the company. Furthermore, the gain for December was 300 per cent over December, 1919.

NASH MOTORS PROFITS

For 1920 the Nash Motors Company, Kenosha, Wis., showed a profit of $7,007,047 after charges, taxes and dividends of $315,000 on preferred stock were paid, which represents $122.49 a share on the 54,550 shares, as compared with $93.06 in 1919.

KALAMAZOO'S SHOW A SUCCESS

The ninth annual Kalamazoo automobile show, which ended last Saturday, was the biggest and best this city ever had. It resulted in many sales and an exceedingly large number of future buyers' names being put down on the salesmen's notebooks. Cars shown were Dodge, Cadillac, Chevrolet, Overland, Roamer, Reo, Scripps-Booth, Buick, Mitchell, Grant, Packard, Paige, Marmon, Studebaker, Willys-Knight, Hupmobile, Essex, Hudson, Nash, Auburn, Oakland, Oldsmobile, Franklin and Ford.

Nineteen-twenty was a good year, if not a record breaker, with many of the dealers. Otis H. Boylan, of the Kalamazoo Implement Company, said that Reo passenger cars and speedwagons aggregating more than $450,000 in value were sold. Thomas M. Orrell, sold, gross, $500,000 of Oakland, Franklin and Kalamazoo vehicles. The Kalamazoo Auto Sales Company, which handles Overland and Willys-Knight, reported sales totaling $1,200,000. F. N. Milliman, of the Milliman-Curtis Company, says it was the best year in the sale of Mitchell and Scripps-Booth cars he ever had.

CHALMERS PLANT HIRING MEN

Within the week the Maxwell-Chalmers corporation has added 450 men to the working force of 1,500. During the week of January 17 the total number of men called back to Detroit plants was 1,364.

JOINING DURANT MOTORS

According to reports from Los Angeles, R. C. Durant, who has represented Chevrolet, Scripps-Booth and Sheridan interests on the Pacific coast, has resigned as vice-president and sales manager of the Chevrolet Motor Company of California and will join the Durant Motors. The report also includes C. M. Steves and Capt. A. G. Waddell as new additions to the Durant organization.

REPUBLIC RUBBER PLANT AT WORK

The plant of the Republic Rubber Corporation, Youngstown, O., has resumed production.

DEFIANCE TRUCK'S NEW OFFICERS

The Defiance Motor Truck Company, Defiance, O., has elected the following officers: C. H. Kettenring, president; J. C. Ayers, vice-president and general manager; Charles Behringer, vice-president and works manager; H. R. Morse, secretary; J. F. Robertson, treasurer. The foregoing were also elected to the board of directors. Frank W. Warrington, formerly assistant sales manager of the Denby Motor Truck Company, who is now general sales manager of this company, was elected a director.

DUPLEX TRUCK ADDS DIRECTORS

Stockholders of the Duplex Truck Company, Lansing, have voted to amend the by-laws to increase the number of directors. Charles W. Nichols and Bert S. Gier have been added.

LANSING WANTS MOTOR SHOW

Because of the interest shown in the national shows and the importance of the industry to Lansing, a movement has been launched there to give an annual automotive exhibition. Both manufacturers and distributors are interested in the proposal.

OLDS MOTOR WORKS GETS ORDERS

From California distributors the Olds Motor Works, Lansing, has received orders for 600 cars and may be obliged to increase the plant's working force.

GRAND RAPIDS TIRE PLANT OPENED

The plant of the Grand Rapids Tire & Rubber Company, Grand Rapids, has been reopened with 400 men at work. L. A. Brown has been elected president of the company.

CADILLAC TO HOLD A SHOW

The Cadillac Automobile Association, Cadillac, at its annual meeting a few days ago decided to hold an automobile show in March, in the MacDonald Auto Sales Company's building.

OVERLAND PROMOTES CULVER

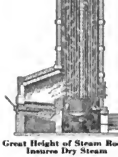
E. N. Culver, 10 years with Willys-Overland, Inc., has been appointed assistant sales manager. Formerly he was sales director of the southern division.

FORD DENIES COAST REPORT

The news published in California that the Ford Motor Company would establish an assembling plant in San Jose is erroneous. Officials of the company say that no building project has been planned in that city and that the report probably concerns a show room and service station to be erected by the local Ford distributor.

PAIGE-DETROIT ADDING TO FORCE

Since the plant of the Paige-Detroit Motor Car Company was reopened January 3 with 100 men, the working force has been gradually increased to 830 and about 40 cars a day are being produced. Orders on hand show an excess over normal of about $2,000,000.



LESTER LEAVES PACKARD

C. R. Lester, technical service manager of the Packard Motor Car Company, and recognized as an authority on technical service in the motor industry, has resigned.

DAIL SALES 50% LARGER

The Dail Steel Products Company, Lansing, reports that during the last year sales have increased 50 per cent. The plant has been operating on full schedule and has not laid off an employe who has been with the company six months or more. Officers elected are: President and general manager, Ernest I. Dail; Secretary, E. W. Goodnow; treasurer, Frank N. Arbaugh. These, with A. C. Stebbins and R. M. Potter, compose the directors.

Wills Production Starts At Marysville Factory

The period of preparation and testing being now a matter of history, C. H. Wills & Company, Marysville, have made their first public announcement that the new Wills Sainte Claire car is now being produced. While the output at present is limited, it will be steadily increasd so that sales will be in progress by the beginning of March. The prime object just now is to provide all the cars needed by the six distributors which thus far have been appointed, and which are located in New York, Boston, Philadelphia, Chicago, San Francisco and Los Angeles.

As was announced in this publication in its issue of October 2, 1920, the Wills motor has eight cylinders and is of the V-type, the cylinders being set at an angle of 60 degrees. The valves and camshafts are of overhead type of construction and the camshafts are driven by means of spiral bevel gears, no chains being used. Ball bearings are used throughout. The car, which has a wheelbase of 121 inches, weighs approximately 3,000 pounds, and while the sales price has not been finally determined, it is said that it is likely to be around $3,000. The wheels are special steel disc design and are fitted with 32 by 4½-inch cord tires.

Probably the principal feature of this newcomer in the American automobile market is the fact that a special steel, known as Molybdenum, is used in its construction, and that this new steel was developed by Mr. Wills. Unless we are mistaken, Mr. Wills has been granted patents relating to his Molybdenum steel. The claim is made that the new alloy is stronger than other steels and makes possible the construction of lighter parts than with the ordinary alloys. It is also said that through its use vibration is greatly reduced.

In designing the Wills Sainte Claire, Mr. Wills not only brought out a car which embodies his own ideas as to what a fine automobile should be, but he has combined in it some of the fine points of the best known cars made.

Judging from the fact that some 4,000 automobile dealers have applied for the agency or distribution rights in their respective territories, it is evident that the new machine created considerable interest even long before it was in bine print. That is due to the fact that Mr. Wills is known in the automobile trade and industry as the man who put the Ford on the map mechanically. It was he who designed the now famous Ford Model T. He was identified in an executive capacity with the Ford Motor Company from 1903 to 1919, being latterly chief engineer.

The complete roster of officials of C. H. Wills & Company is as follows: C. Harold Wills, president; John R. Lee, vice-president; Kirkland B. Alexander, vice-president; Charles Morgans, vice-president; Ferris D. Stone, secretary; Frank P. Book, treasurer; George S. Anderson, assistant secretary-treasurer. It may also be of interest to state that the financial institutions interested in the company are all Boston firms, namely, the National Shawnut Bank, Kidder, Peabody & Company and F. S. Moseley & Company.

The plant has been under construction for more than a year and the working force has been gradually increased. This week marks the beginning of the real production activities. Fifteen hundred men have gone to work.

STAMPING DIRECTORATE ENLARGED

The Lansing Stamping & Tool Company has increased the directors from five to seven. They are Charles Lawrence, G. L. Robinson, F. M. Odel, G. F. Conway, E. T. Conway, K. H. Shultes and William Kerns. The officers re-elected are: President, Charles Lawrence; vice-president and general manager, G. F. Conway; secretary and treasurer, F. M. Odel.

W & S No. 4 Universal Turret Lathe equipped to finish a Cast Iron Pulley

W & S Service

From blue prints or your samples, if you desire, we suggest methods of doing your work and estimate the time and cost of doing it. If your work can be done to better advantage on machines other than our turret lathes, we tell you what we think will do your work best. We have had forty years' experience making and tooling turret lathes and in that time have developed a very excellent Engineering Department to study modern production methods. The Engineers in this department can advise you about all kinds of modern machine equipments.

We beg you to avail yourselves of our facilities. Sending your blue prints and samples for estimate does not obligate you to buy, unless it is your wish to do so.

TRANSPORTATION NEWS

Rail :: Commercial Hauling :: Water

Detroit—Federal Judges Arthur J. Tuttle, Detroit; John M. Killits, Toledo, and A. C. Denison, Cincinnati Court of Appeals, have ruled that the 3-cent railroad fare in Michigan intra-state traffic shall stand, and have issued a permanent injunction restraining the Michigan Public Utilities Commission from interfering with its enforcement. The judges ruled that during the war state authority was suspended and during the "twilight period" between war and peace war measures must remain in force.

Lansing—Hearings for the purpose of fixing freight rates on intra-state traffic will begin before the Michigan Public Utilities Commission February 1, while the decision as to the respective authority of the state and interstate commissions will be left to the courts. This order issued to all railroads seems to be the result of the failure of the railroads, traffic organizations and sand and gravel concerns to reach a satisfactory agreement. Another order fixes February 2 as the date for the hearing on rates for sand and gravel, to be followed by hearings on other commodities.

Philadelphia—As a protection for ticket agents and the public the Pennsylvania Railroad has ordered the fares printed on the faces of all tickets.

Michigan City, Ind.—At the annual meeting of the Graham & Morton Transportation Company J. S. Morton was re-elected president. Nathaniel Robbins, who last year bought a controlling interest, is now vice-president; Hunter S. Robbins, secretary, and A. Reichlem, treasurer and assistant secretary. The first three named officers and Charles F. Delbridge, Detroit, and W. H. Morton, Benton Harbor, constitute the board of directors.

Lansing—According to W. K. Andrews, Pere Marquette freight agent, the yards in Lansing may be enlarged and a warehouse and office built in the near future. Plans for these were postponed on account of the dullness in business. Track extensions have been built and more are proposed. Many new cars and several engines have been added to the service. The carloads of automobiles and accessories are increasing of late, and among the firms which have contracted for shipping are the Ideal Engine and Capital casting companies.

Bay City—The Michigan Railway Company has been notified by the secretary of the Interstate Commerce Commission that testimony in the case of the interurban lines vs. Pere Marquette Railway, and others will be taken before Examiner Howell, of the Commission, at a hearing to be held in the Board of Commerce rooms, Detroit, at 10 o'clock on the morning of February 7. The case is the outcome of effort on the part of the traction lines to effect an agreement providing for through rates and billing between the electric and steam transportation systems in Michigan. In this action the interurban lines are seeking to show that interchange of business between steam and electric lines will improve service to Michigan shippers.

Kalamazoo—Continuation of the traffic bureau of the Chamber of Commerce, with an increased budget assured to take care of the deficit incurred during the last year and to push the work during the business year beginning February 1, has been recommended to the board of directors of the C. of C. The resolutions declared that the bureau's work was of such a nature that it could be dispensed with.

George J. Bolender, secretary of the bureau, reported that during the 11 months ended January 1 of this year collections for members in refunds from railroads on overcharges totaled $15,988.28.

Detroit—The Lumber Carriers' Association of the Great Lakes, in convention in Detroit, January 18, elected the following officers: President, O. W. Blodgett, Bay City, whose address in the season of navigation is Duluth; first vice-president, Edward H. Thomas, Chicago; second vice-president, F. P. Potter, Cleveland; third vice-president, Herman H. Hettler, Chicago; secretary and treasurer, Captain Charles H. Weeks, 762 Drexel avenue, Detroit.

Grand Rapids—William Miller Wardrop has been elected vice-president, and A. L. Farmelee, secretary and auditor of the Grand Rapids & Indiana Railway. Their offices will be in Grand Rapids.

Washington—In the matter of the Cleveland Cliffs Iron Company vs. the Munising, Marquette & Southeastern Railway Company, the Director-General of Railroads, as agent, et al., the Interstate Commerce Commission has found that the rates applicable on sulphuric acid, in tank-car loads, from New Furnace, Mich., to Steelton, Minn., are unreasonable and has awarded reparation. The case, which was No. 11141 on the Commission's docket, was submitted on October 15, 1920, and decided on December 9, 1920. The finding has just been published.

The Luxeberry Painter Says:

"There are two reasons why I always recommend Berry Brothers varnish products.

"One is that they represent the result of over sixty years of experience.

"The other is whether the order is for a can or a carload, the quality and service are the best."

"Nothing Freakish" About Mr. Durant's New Car

Among automotive engineers much interest is being shown in the new Durant Motors, Inc. Some believe the company will bring out something radically new in design, while others point out that Mr. Durant always has been identified with manufacture on conservative lines. The guessing as to the price of the car is lively. There are those who are willing to wager that the figure will be within the reach of anybody wishing an automobile. Some even predict that Mr. Durant hopes to compete with the Ford Motor Company. At the present writing the indications are that, however, the impression in the trade is that the Durant is likely to be marketed at between $650 and $800.

Mr. Durant himself has not given out any details as to his car, but is quoted as having said: "The new company will be in active operation by August 1, 1921. Its purpose will be to bring to the good will as can be possibly made for the money, and the price of it will be less than $1,000. It will not be a freak or anything in the line of something made merely with the idea of it being low in price. The name of Durant bears too good a reputation and the company bearing his name make every effort to maintain that reputation and thus repay the host of friends who have offered their service, their advice, their money, their co-operation."

In a statement to the Philadelphia Public Ledger, Mr. Durant is quoted as follows: "I cannot go into the details regarding the corporation at this time, other than to say that it will have one kind of stock, with every subscriber to the initial offering upon exactly the same basis as to price, with no commissions, bonuses or reservations to myself or associates issued for experience, ability or past performance."

GILKEY SEES A REVIVAL

Dan Gilkey, vice-president of the Acason Motor Truck Company, Detroit, feels confident that the revival in the truck business is on the way. As a matter of fact, he has just closed a rather large contract for Acason distribution in New York city, and this did not come as a result of the New York automobile show or any other.

"Acason is not taking in any shows this year," said Mr. Gilkey. "We feel confident that we shall be able to sell as many trucks as we make, judging from the number of inquiries which have been received at the factory and which come from all over the country. It is evident that business men are again lining up to buy utility vehicles and we look to the future with confidence."

INDUSTRIAL BUILDING

Progress, Projects and Contracts of the Week

Detroit—The municipal building department reports for the week ended January 22 a substantial increase in the number of permits issued for buildings for which permits were obtained. All told, 193 permits were issued, involving an expenditure of $1,757,678, as compared with 175 permits issued the previous week and entailing an outlay of $434,475. For the corresponding week a year ago the number of permits issued was 197 and the value $1,459,805. The big increase for the week is due principally to the permit for the 18-story Stroh building to be erected on Adams avenue west and which is to cost $1,000,000. The reports from the Detroit Builders & Traders' Exchange for the last two weeks show several more important lettings than for previous recent weeks. Among the contracts awarded were the following: A one-story factory building for the Anchor Building Company, at West Grand Boulevard and Fort street; a three-story store and office building at 1508 Randolph street; a one-story office building for the Mercier-Bryan-Larkin Company, at Miller Road and the M. C. R. R.; an addition to the factory of the Consolidated Cigar Company, on St. Aubin avenue, and a three-story library building. Included in the list of new work projected and in the hands of architects, are the following: A four-story and basement, society and club house; a brick and steel training school to be erected in Ypsilanti; a two-story and basement, concrete and terra cotta bank building for the First State Bank of Royal Oak; a brick and stone church building; a concrete and steel lunch and billiard room; a brick and steel theater building and a number of other items of a varied nature.

Chicago—The National Association of Lumber Manufacturers, in convention here adopted a resolution calling upon all workers in the building trades and contractors, manufacturers of materials and dealers to make reductions in costs wherever possible so that house building could be made possible this year.

Detroit—The city council has approved an expenditure of from $14,000,000 to $16,000,000 for the Conner's Creek sewer and plans have been made to condemn land for it.

Port Huron—Carpenters, painters, paperhangers and other workers in the building trades have voted to accept a 10 per cent reduction in wages, which will affect workers here, in Marysville, Marine City and St. Clair. From 90 cents to $1.10 has been the scale.

Detroit—F. J. Fisher and C. T. Fisher, president and secretary, respectively, of the Fisher Body Corporation, have purchased for themselves and not the corporation 22 acres of land in Ecorse, where it is proposed to erect a plant in the future. No plans have been made as yet. The land is located between the D. T. & I. and Michigan Central railroads.

Holland—The Home Furnace Company is planning to enlarge its plant. James De Young is manager.

Detroit—The city council has approved the purchase of $14,525 for a site on St. Jean avenue on which will be constructed a car barn for the municipal street railway system.

Grand Rapids—The Consumers Ice Company is planning to erect an ice plant here, the building to cost $200,000.

Detroit—This city shortly will advertise for bids on sewer work to cost $2,000,000, the money to come from a recent bond issue of $25,000,000.

Detroit—The spring building show of the Detroit Builders Exhibition Company will be held in the Armory, March 19 to 27. Directors elected are as follows: J. D. Abram, W. R. Anderson, Harry Booth, Charles Brushaber, C. N. Carswell, J. W. Depp, C. H. Keter, E. O. Knight, G. W. J. Linton, Frank P. Miller, J. A. Patterson, C. J. Prost.

New Speed Wagon Axle Brought Out by Clark

A new speed wagon axle has just been put in production by the Clark Equipment Company, Buchanan, manufacturer of a complete line of motor truck axles. This axle is not a converted passenger car axle but is especially designed for commercial car work. The axle is intended for use only on trucks of one ton or less.

In this new Clark product is incorporated the strength characteristic of the heavier type of Clark axles. The axle is a fixed type bevel gear construction with a pressed steel load-carrying member or housing designed specially for truck service. The differential is a standard type supporter in a carrier and can be removed from either the front or rear of the axle. The differential is mounted on ball bearings and the radial and thrust loads are taken on radial ball bearings. The differential is easily adjusted by removing the cover plate located on the back of the load-carrying housing and by removing the adjusting nut in the direction desired, or by moving the third member cage either up or down.

The wheel bearings are of the straight roller type and are designed to take the thrust in both directions. The bearings are so mounted that the thrust on each wheel is taken care of independently by each bearing, rather than transmitting the thrust in the direction of the wheel bearing on the opposite side, which has been the general practice on passenger car axle construction. Taking the thrust in both directions on one wheel bearing eliminates possible wobble and wheel looseness.

The hub is mounted on a six-splined shaft, the drive being taken through this shaft, and is so designed that the hub may be drawn up by tightly clamping the inner race of the wheel bearing.

Brakes are internal, 2½ inches wide, of special design, using four shoes to each wheel. The brake drums are bushed with oilless bearings. This axle is designed to carry 3,000 pounds on the spring pads and to handle 1,600-inch pound torque motor. The standard rear reduction that can be furnished on this model is 5.9 to 1 or 6.2 to 1. The 6.2 to 1 reduction is furnished with spiral bevel gears. The weight of the axle if approximately 360 pounds complete with hub parts.

WOULD TAX DRIVEAWAYS

Senator James Henry, Battle Creek, has introduced in the Legislature a bill imposing a tax of $3 a car on all motor vehicles sent from Michigan assembling plants by the driveaway method into other states. He bases his bill, he says, on the contention that Michigan highways are used and depreciated by such cars, from which the state derives no direct benefit for road maintenance.

During 1920 Michigan iron mines produced 17,232,000 tons of ore and shipped 18,715,000, valued at $53,628,000.

Fisher Body Taking Over Its Ohio Organization

The Fisher Body Ohio Company's mammoth automobile body building plant being erected in Cleveland is expected to be in operation March 1, according to an announcement by Richard Inglis, of Otis & Company and an officer of the Fisher Body Corporation, says the Cleveland Plain Dealer, which continues:

"The plant, one of the largest industrial units in the country, is the last word in construction for building motor car bodies and is equipped to do upwards of $20,000,000 of business a year.

According to Mr. Inglis, the Fisher Body Corporation of Detroit will furnish the Ohio company with at least that much business in the first twelve months of operation.

"Stockholders of the Fisher Ohio Body Company are being advised that the Fisher Body Corporation, holder of 55 per cent of the common stock of the Ohio company, proposes immediately to issue to holders of its own common stock five shares of new no par value common stock for each share of present stock.

"After the number of shares of the Detroit company is increased to make this exchange possible, the Fisher Body Corporation will give for each share of the Fisher Ohio common stock one share of the new stock of the parent corporation plus $2.50 in cash. Such exchange is effective when holders of 40,000 out of 45,000 shares held by others than the parent company surrender their stock.

The Fisher Corporation guarantees the 8 per cent preferred dividend on the Fisher company from April, 1920, until July 1, 1922, the first payment of which was made January 1. After that time it is expected that the Ohio company will be able to keep up its dividends on preferred stock.

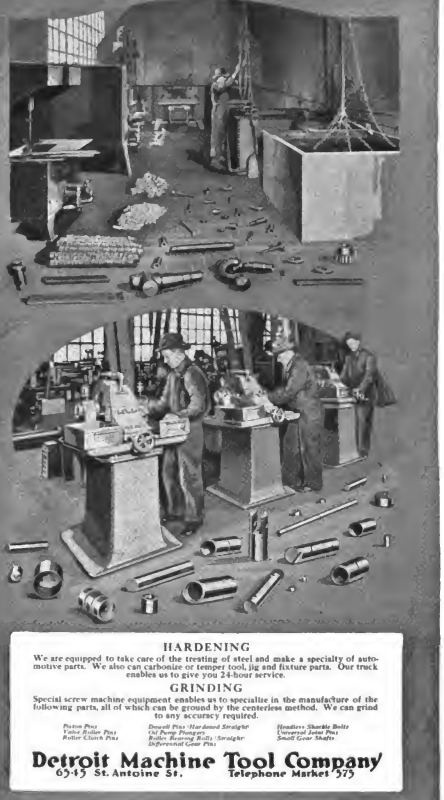
"Under this plan of merging the common stock of the Ohio company with that of the parent organization, dividends would start with the May 1 disbursement. The Fisher common has been paying $10 a year so that after the shares are split up it is expected that a rate of $2 a year probably will be maintained.

"With this shifting of control from subsidiary to parent company, it would indicate possible simplification of Fisher Corporation holdings, which embrace among other subsidiaries findings and glass plants.

"The Fisher Body Corporation has reduced its inventories to a minimum and is now said to be in an unusually strong cash position. It can effect further economies through the consolidation of the Cleveland plant with that of the parent organization."

Detroit 1921 Auto Show Will Be Held March 19-26

Detroit's twentieth annual automotive show, under the auspices of the Detroit Auto Dealers' Association, will be held in the new Morgan & Wright factory building, on Jefferson avenue, March 19 to 26, according to a decision reached this week by the directors of the D. A. D. A.



The building, which affords 150,000 square feet of floor space, will be one of the finest factory units in the city. It is now nearing completion. It is made available for the D. A. D. A. through the courtesy of the United States Tire Company, of which Morgan & Wright, Inc., is a subsidiary.

The show will be all on one floor

DETROIT, SATURDAY, JANUARY 29, 1921

Repeal the Law Exempting Bonds From Taxation

A STEP in the right direction has been made by the introduction into the Legislature of a bill, sponsored by Representative George Lord, repealing the tax exemption now permitted upon bonds of municipal governments of states outside Michigan. If that bill be followed up by another repealing the statute doing away with the exemption now granted to bonds of the municipalities within the state, the work of putting this class of property under contribution to the state will be made complete.

In some previous discussions of this subject we have gone over the general wrong which is permitted to continue by failure to include in the list of taxable property of this state a body of capital which, so far as can be estimated, is equal to one-tenth of the equalized value of the state. Last week we called attention to the favorable effect which the taxing of so much capital, as other property is taxed, would undoubtedly have upon the provision of the houses which are so badly needed in our cities and villages. That the reaction upon other conditions would be equally favorable seems extremely probable. We have now a condition in Michigan in which many industrial institutions are seeking additional capital, either for expansion or for the fixing on capital which has been heretofore provided in part by bank loans. The absence from the normal supply of money capital available for such purposes of the great amount which has been attracted to tax free bonds has had a double effect upon the facility with which money may be obtained for industrial purposes. As Chairman McFadden, of the congressional committee on banking and currency, has shown in some calculations made for federal tax purposes, a 5 per cent tax-free bond is as valuable to a person with $100,000 annual income as a 7.3 per cent investment in real estate or industry. On the same basis of calculation, a 6 per cent bond, tax free, is as attractive a possession from the standpoint of interest as an 8.76 per cent investment in real estate or industry. The double wrong produced by the exemption of municipal bonds which is reflected upon industry is that the exemption attracts money away from it and sets up artificial minimum of return which must be realized before industrial investments can become proportionately attractive. We are fed today with public rumors about the largest of our industries being in the market for sums of money required for its development. The units which go to make up so large a sum which is required must naturally come from people of large means, who apply all their information and intelligence to the realization of the best returns upon their capital. To these the tax exempt bond has already made its appeal and the industrial requirement which we have just noted must compete with the tax exempt bonds to the extent of producing an equal net return. Compare the usefulness of the two bodies of capital. That invested in the tax exempt bonds is a lazy capitalist investment; that which is required for the industrial establishment keeps the wheels of industry turning, keeps men in employment, earns money which will be devoted to expansion, increased employment and is generally useful to the entire community. Yet the price which has to be paid for its use is set by the immunities extended to capital not nearly so usefully employed.

The farmers, the city workers, the producers of raw material for building operations and those who fabricate these raw materials into houses, factories and stores, owe it to themselves and to the best interests and growth of the state to induce the Legislature to repeal the law of 1909 which grants immunity from taxation to the capital invested in municipal securities. So long as a sum approximating one-tenth of the present equalized value of the state is not available for the purpose of taxation there can only be unrest with the present system of taxation.

"Coming Clean"

THE COUNTRY is being flooded with wholesome advice as to the kind of mental attitude everybody ought to strive to maintain in the face of a complex business situation which does not appear to be clearing up as rapidly as might be hoped for. The keynote of the speeches being delivered and the resolutions passed and the letters mailed is that we should be optimistic, remembering that conditions are fundamentally sound and the readjustment is the best thing that possibly could happen to us. We are reminded that our 1920 crops were of unprecedented magnitude—enough to guarantee that everybody will be well fed, and to spare; that our banking system is proof against any and all assaults; that the world's shelves are bare and that therefore the lull in buying can be only temporary. All this evidence, and more, is being adduced to show us that we are not by any means in a precarious position and that all that is necessary for us to do is to keep our wits about us—and "keep a stiff upper lip."

All this is very good and proper, but it appears to us that too little is being said about something else quite as important, and that is that what we need now and shall need during the next few months—and until kingdom come, for that matter—is the practice of the old fashioned brand of honesty which led men to be scrupulously fair in all their business dealings. We need to quit our "four-flushing" and get down to brass tacks.

Most everybody, these last four or five years, has been engaged in the gentle art of "throwing the bull." Oodles of money and oodles of business did it. There was the play of economic laws, to be sure, but there was also the "bull" which threw the equation out of joint, inflating the credit structure, inflating prices, inflating profits, inflating earnings. A lot of "wind" was pumped into everything. Now that the balloon has been punctured, and we are going to have to get used once more to a reasonable amount of money, a reasonable amount of business, a reasonable amount of profits, a reasonable amount of wages and a frank basis of business dealings, we might just as well make up our minds that we are going to have to "cut out the bull."

The man who supplies the raw materials for industry is going to have to come to understand that he must furnish, on the date specified, the quality and the quantity specified; the man who buys the material, too, is going to have to understand that a contract is made to be kept and not to be evaded; the man who wants credit accommodation is going to have to understand that his collateral is worth all he says it is, and that means at current prices; the salesman is going to have to understand that it will be quality and dependability that will determine the price of an article and its precedence in the market, and not that it will sell because there is a "shortage."

Digitized by Google

real or alleged, and everybody is on a "buying spree"; the man who works at a bench is going to have to understand that it is his ability to produce that is going to gauge his wages and his continuity of employment, and not that he will be retained at a fancy figure because nobody can be found to take his place, or because he happens to be a member of an organization that carries a big stick; and the employer, in turn, is going to have to understand that in his dealings with his men he must "come clean." And so on, down the line. We have got to return to first principles.

This means that, in addition to making resolutions, we have got to carry them out. The man who gets down on his knees at church and prays to be delivered from all evil, and then the same afternoon goes out and embraces evil, not only insults his Maker but wastes his own words.

By all means, let's be optimistic; but by all means, too, let's get back to the fundamentals of business integrity. The day of "soft soap" is over.

Germany Today

THERE is a lawsuit in Midland county over a horse which was shot and buried but which during the night came to life, it is alleged, and found his way into the plaintiff's barn, where he ate of plaintiff's oats while said plaintiff slept.

Germany has just about duplicated this trick. After underbidding a large number of English firms, a German concern has obtained a million-dollar contract for electrical appliances and at the same time English merchants are complaining that German fabrics are being offered in London of a fine quality and at prices which are less than English cost of manufacture.

From the current Protectionist we learn further of Germany's come-back. The North German Worsted Manufacturing & Yarn Spinning Company, Bremen, has paid a dividend of 62 per cent and is doing a business four times its pre-war trade. The Mitweida Cotton Spinning Company advanced its net profit from 2,000,000 marks in 1913 to 9,000,000 marks in 1919-20. Nine other textile concerns are paying dividends ranging from 16 to 41 per cent, all of which is being done after paying the huge war taxes and placing heavy reserves. Out of 269 company reports analysed, the Protectionist shows that 178 paid increased dividends compared with the previous year and 52 paid double dividends. Capital stock subscriptions totaling 7,272,000,000 marks were raised during the first three quarters of 1920 and during September there were only two instances in which the money requested was not quickly subscribed. During the period 13 municipalities floated loans totaling 382,000,000 marks.

German coal mines are gaining rapid headway financially. The Vereinigte Koenigs and Laurahwette made 50,000,000 marks profit in 1920. Of 15 companies reviewed, the lowest dividend was 8 per cent and the highest 22 per cent, the average being 15 per cent. Of 13 iron and steel company reports, the average dividend for the fiscal year just ended was 21 per cent. Of eight lace concerns examined, the average dividend has risen from 14 per cent to 26 per cent. Seven electrical firms increased their average from 4 to 7 per cent. The trend of dividend reports of other industries in Germany runs much the same. Paper makers have done especially well on account of large exports to Holland and the United States.

The Reichsbank in its last quarterly report states: "At the end of the third quarter of 1920 the economic life of Germany, after the setback of the spring, now presents a comparatively assuring aspect." One Saxon firm which generally has a turnover of from one and a half to two times the amount of its capital (16,000,000 marks) had during the last half year a turnover of 200,000,000 marks. German commercial travellers are already in England in considerable numbers and German dye houses are offering splendid ranges of dyes in shades far beyond anything British dye manufacturers can produce and at prices 30 per cent below the nearest English prices. Residents in Germany report a much more settled political situation and that there is little likelihood now of any great disturbance. Peoples are better fed; food is more plentiful and a greatly increased willingness to work. The renaissance is proceeding at a pace which few people expected.

Short Measure Stuff

COME ON, LET'S HELP THIS CHAP EXPLAIN.

SONG

You ask me why I love you, sweet,
What makes me worship at your feet.

You tell me why this hawthorn tree
Produced the blossoms that you see;

And tell me why these thrushes here
Are making music for your ear;

You tell me why the sky is blue—
And then perhaps I'll answer you.
—Wayne Gard in the Chicago Tribune.

Nay, I can tell the reason of
My lodicless and reverent love:

I know not why the hawthorn tree
Produced the blossoms that I see;

Nor know I why these thrushes here
Are making music for mine ear;

But oh my love, the sky is blue
Because it's far away from you.
—F. P. A., in The Conning Tower.

My darling, F. P. A. told you
What makes the skies appear so blue;

But he don't know those other things
Concerning which your sweetie sings;

But love, the thrush's warbling comes,
From feeding him a dish of crumbs.

"Religion is not always good stuff," said Bolo Soope to us the other day. "Heard a preacher advise 'letting your light so shine, etc.,' that I took the hint and then the boss called me down because the bills were too high."

The young lady who defied convention by wearing bangs now has a granddaughter who sports a split skirt.

PRETTY SOON NOW

I don't want to get in the cabinet,
A job in the League—not at all,
I can't be away on the opening day
When the umpire bellows "Play Ball."

Henry Ford wants to make a little touch. We don't suppose it will matter what faith that money belongs to, just so he gets it.

Dance reformers are going right down the line. In Grand Rapids they have banned cheek-to-cheek dancing, the shimmy and the camel walk. As Andy Gump would say, Oh, Minuet!

The demands of the farmers on Congress have been recognized. The free seed appropriation has been increased by 50 per cent.—A. F.

Useless Duplication

WHEN F. R. Hathaway, treasurer of the Michigan Sugar Company, appeared before the ways and means committee of the House of Representatives and gave vent to his feelings about the annoyance and foolishness of the Government's action in asking for five to seven almost identical reports of the affairs of his enterprise, he voiced a complaint which should be carried to Congress with emphasis. Mr. Hathaway testified that auditing staffs of the beet sugar manufacturers were kept busy half of their time supplying information in practically identical reports demanded by different branches of the Government at various periods in the year. His is not the first complaint of this nature. We know of a Detroit bank which was requested recently, under penalty threatened, to report the most minute details of all the purchases of the institution during 1917, covering blank books, supplies, deposit slips, etc., notwithstanding the fact that the same office of the Government had advised on two previous occasions that it was unnecessary to go to this trouble. The Fordney proposal to establish a central bureau at Washington whose duty it would be to act for all departments in obtaining reports would cure this difficulty.

FINANCIAL

THE BUSINESS OUTLOOK

By PHIL S. HANNA

A WASHINGTON computation, printed in Detroit papers Wednesday, exhibits an unpleasant employment situation, but these figures we understand cover the period from December 15 to January 1, and while no doubt the conditions during the holidays is fairly accurately represented, it must be remembered that most of the plants in the city were taking inventory at this time. Statement was made Wednesday that if the Ford plants were to start at once and take on 25,000 men there would be a temporary labor shortage in Detroit.

This brings to mind the all absorbing topic of what is going on inside of the Ford Motor Company. It would be idle to add much to the press reports concerning this company, but one thing seems certain, as a well-known financial man stated, that things are "certainly all balled up." There came Monday a most authentic report that Joseph A. Bower had been selected as treasurer to look after the interests of the Morgan people who had made Ford a big loan, and on Wednesday there appeared in the press an emphatic denial that Ford had been looking for a loan.

The prohabilities and conjectures of the situation are outlined in another part of this publication so that t will be needless to duplicate the theories in this article, but there is a serious side to the proposition that concerns the people of Detroit and elsewhere considerably. And that is the necessity of getting the big Ford plants going at an early date. Mr. Ford has in his farms and many private interests all the means of food production that he may need for his personal well being and in other respects he is fortified personally to stand out against a non-production program for a much longer time than most of Detroit, so that personally he could close shop if he chose to do so rather than meet the terms of outside money loaners. But what of Detroit eventually should he close shop indefinitely? It needs but little imagination to picture the result. However, conceding this turn of events to be unlikely. Suppose, if it is true that Ford needs working capital, he decided to fight it out alone by selling what manufactured cars he may have on hand and leave the big plants idle until such sales have brought in the capital sufficient to start production on the old scale. Overhead is a big item, which could be greatly reduced, and it seems safe to assume that funds on hand would finance such a program for a time. What then would be the eventual effect on Detroit?

There comes to mind many small manufacturers who have been supplying parts and other larger ones, too, who would continue in idleness, to say nothing of the possible annihilation of their businesses. Then there are the 50,000 employes and their families, say 125,000 people all told, directly dependent on the company who cannot pick up like the "suit case" employe and move back to Poseyville or Peoria, and another 100,000 or more indirectly dependent through business relations, and lastly the far greater number of Detroiters whose financial welfare indirectly depends on the Ford pay check for not a small percentage of their daily income, who must consider the effect of a continued shut down of the Ford plants. No, even a protracted partial shut down must not occur.

This is not intended to inspire gloomy forebodings, hit rather to promote sane and sober thinking about an eventuality that is possible because of the peculiar circmstances that seem to have arisen around an institution that as a factor for good or evil is gigantic in its potentialities. Private property rights might enable a man in the position of Mr. Ford to inflict the injury outlined, but the best way to avoid injury is to take steps to prevent it. With almost all the rest of the United States giving daily evidence of a return lu the direction of normal business activities It would be indeed unfortunate if a force such as that wielded by Mr. Ford should even temporarily be misdirected.

We have heen hearing much of deflation of currency, deflation of credit and deflation of prices, but what about deflation of desire? Isn't there as much work to be done in this latter direction as in the others mentioned? There is the man who desired a new car every spring who has decide to make the old one do until he has the purchase price in his pocket; his desire, temporarily at least, has been deflated. Then we have many examples of the retailer who tried to maintain the wartime margin of profit regardless of changed costs and conditions; his desire likewise has been deflated and he is now reconciled to the "half loaf better than no bread" idea. And so on down the line. The farmer especially has some inflated desires, the scaling down of which forms the key factor in the business outlook today, and if he would only throw his purchasing power into the market now there would be added about 48 per cent to the ranks of the buying public.

DETROIT COPPER & BRASS ELECTION

At the annual meeting of the Detroit Copper & Brass Rolling Mills, January 26, the board of directors was increased from seven to nine and the following were elected to serve for the ensuing year: A. H. Buhl, L. D. Buhl, G. B. Davis, F. J. Hecker, F. H. Hoffman, L. H. Jones, R. P. Joy, A. J. Peoples, H. D. Sheiden. Officers: L. H. Jones, president and general manager; R. P. Joy, vice-president; A. H. Buhl, vice-president; F. H. Hoffman, assistant general manager; A. J. Peoples, secretary-treasurer; W. P. Bache, assistant secretary-treasurer; J. E. Workman, auditor; Alexander Henderson, works manager.

JACKSON FIRMS INCREASE STOCK

The L. H. Field Company, Jackson, has increased its capital stock from $100,000 to $500,000, and the Central City Lumber Company from $20,000 to $100,000.

FORD TRACTOR CUT $165

Edsel B. Ford, president of the Ford Motor Company, announced Wednesday that, effective from that day, the price of the Fordson tractor is $625, a reduction of $165 from the former price. The cut has been made possible by lower material prices. Mr. Ford added that there was no chance for any further reduction in the prices now quoted on either the Ford passenger cars or trucks, but that on the contrary there was no guaranty against increase.

MERRICK MUCH IMPROVED

Frank W. Merrick, who has been confined in a hospital at Saginaw the past two weeks on account of an infection in one of his eyes, is reported greatly improved and is expected back in Lansing in the near future.

Buhl Sons Co. Move Into New River Front Building

After 63 years continuous business development at one location Buhl Sons Company, the largest hardware jobbers in Michigan, is moving into a new building located at the foot of Adair street, Detroit. The transfer of stock, such fixtures as will be used and general equipment from the old to the new building will be completed early in February, and the formal opening of the concern in its new building will introduce to the business life of this country the largest wholesale hardware concern, in area occupied, in the United States.

The new structure is six stories and has frontages of 350 feet on Adair street and 240 feet on the Detroit river. It is constructed entirely of concrete, trimmed with brick and contains a total floor area of 303,000 square feet, approximately seven acres. Every modern device contributing to the rapid and inexpensive movement of material has been incorporated in the building by John Scott & Company, the architects.

BANKER-FARMER MEETING

East Lansing's big day will be Tuesday, February 1, when 10 group chairmen and 83 county members of the Agricultural Commission of the Michigan State Bankers' Association, together with many other bankers interested in the movement, will meet in the gymnasium of Michigan Agricultural College and hear speakers of national repute on financial and marketing problems from the farmer's viewpoint. A prominent banker will present some phase of the present business situation in its relation to agriculture. There will be two sessions, one at 10 a. m. and one at 1:30 p. m.

J. B. McDougal, governor, and Directors W. A. Heath, James Simpson, George M. Reynolds and J. W. Blodgett, of the Federal Reserve Bank of Chicago, were guests of the Detroit bankers Wednesday at the Detroit Club. Their visit had to do with consideration of a site for a permanent home for the Detroit branch of the Chicago Reserve Bank. Plans for the new home have been made because of the unexpectedly rapid growth of the business of the Detroit branch. Several sites are under consideration, but none have been decided on definitely.

McCRORY STORES SALES REPORT

For the 12 months ended December 31, sales of the McCrory Stores Corporation amounted to $14,369,327, an increase of $2,287,356 over 1919.

In any Export Emergency

Whether the grounds for refusal are justified or not, your export shipment needs special safeguards when your documentary draft on a foreign buyer is dishonored. It is in just such emergencies that the service departments of the Irving's Foreign Division demonstrate their capacity and initiative.

Not only is the refusal reported to you at once, but immediate provision for clearing, warehousing and insuring the merchandise is made through the Irving's local correspondent. Then the Foreign Division, consulting with you and acting under instructions, arranges for sale of the goods or for their disposal in some other approved way.

A collection anywhere over-seas is expedited by direct transmission of the draft and its accompanying documents to a carefully selected correspondent bank on the spot, familiar with local conditions and able to protect your interests at every stage of the transaction.

$3,000,000 Sales Reported By Kawneer Co. for 1920

The Kawneer Company, Niles, reports an unusually good year for 1920, with sales in excess of $3,000,000. This company manufactures store fronts and allied metal moldings. At the annual election January 13 the following were elected for 1921: President, Francis Plym; vice-president, E. E. Barber; treasurer, H. H. Heimann; secretary, F. R. Eagleshaft. There was no change in either the board of directors or the officers. Balance sheet figures for December 31, 1920, and December 31, 1919, are given below:

ASSETS

	Dec. 31, '20	Dec. 31, '19
Cash	211,471.78	106,656.16
Notes Receivable	42,217.74	12,742.12
Notes Rec. Av. Stock Purchasers	16,290.74	.....
Trade Acceptances	2,167.20	.....
Accounts Receivable	396,031.73	235,309.05
Misc. Receivable	3,492.84	11,412.86
Raw Material	286,818.62	264,460.50
Goods in Process and Finished	181,747.02	146,230.41
Supplies	9,564.65	10,701.27
Deferred Assets	15,034.19	.....
Liberty Bonds	.....	7,178.79
Real Estate	16,624.52	16,721.46
Buildings less Reserve	211,114.32	181,537.32

Investment Hints

GOOD INVESTMENTS NOW

To the Financial Editor:

I would thank you to furnish me with information as to what you think is a good investment of high grade securities. I wish to invest in same and desire your assistance.

C. B.—Grand Rapids.

You do not state what amount of money you have for investment, so we are taking for sake of the illustration a fund of $20,000. In order to obtain maximum yield and a maximum average of safety without putting all your money in one investment, it is a good plan to split up the fund into five or six classes, ranging from government or municipal bonds down to stocks. With a fund of $20,000 a suitable division would be about as follows:

Government or municipals, $5,000, present yield safely about	7½ %
Public utilities, $5,000, present yield safely about	7½ %
Railroad bonds, $4,000, present yield safely about	7 %
Industrial bonds, $3,000, present yield safely about	8 %
Divided-paying stocks, $3,000, present yield safely about	7 % up

We cannot suggest particular issues but will be glad to appraise any such bonds that you may inquire about. With a split-up of the fund in about the relation shown, an investor may obtain a good return on his investment without having "all his eggs in one basket," and the chance of increase in value of part of the list is a good offset to the chance of depreciation which might occur in others. There never was a time when sound securities could be bought as cheaply as now, but of course the times demand a more careful consideration of the future of the company whose stocks one purchases.—P. S. H.

New Publications

"INDUSTRY" FOR JANUARY

The Frank D. Chase, Inc., Chicago, publication "Industry," for January, 1921, contains a number of interesting articles, among which there is one by Frank D. Chase, "The Employer's Analysis of an Engineer." Mr. Chase places loyalty first, with personality as a second classification, experience third, and education fourth, all of which are essential.

"The method of getting the education," he says, "is of little account, but it must be gotten some way."

L. M. Hansen's article, "How to Get a Foundry That Fits," includes valuable information, typical layouts for malleable, gray iron and steel foundries, with dimension of yards, melting equipment, molding area and core rooms. Other interesting articles are included in the 32 pages of this house organ, a copy of which we are sure may be had if desired.

COWAN "TRANSVEYOR PICTURE BOOK"

A few of the many uses to which the Cowan Transveyor, manufactured by the Cowan Truck Company, Holyoke, Mass., may be put to are illustrated by the "Transveyor Picture Book," recently issued by the company. This handling truck designed for use in plants, warehouses and anywhere materials have to be moved about was originated by a factory superintendent and his master mechanic in an effort to devise some way to move materials and product about the plant with as little damage and loss of time as possible.

The first conveyor was a crude, simple affair manufactured from odds and ends. Since that first machine many improvements have been made and the present truck is in general use. Platforms are provided upon which work can be piled. The truck is made so that it can be slipped under these platforms, the handle depressed, which action lifts the load from the floor, and the burden may then be moved easily and quickly.

Copies of the "Picture Book" may be obtained by writing the company.

NULYNE CO. STOCK INCREASE

The Nulyne Laboratories, Jackson, manufacturer of private formula products and tooth paste, has increased its capital stock to $2,500,000, of which $1,000,000 is in 8 per cent cumulative, participating preferred stock, and $1,500,000 in common. The business was established in 1904 and included the production of physicians' supplies, which department since has been discontinued. The plant capacity is 5,000,000 tablets and 300,000 tubes of tooth paste daily.

Permanent, Dependable, Responsible

These qualities, plus our experience, make our specialized service of value in the successful handling of Trusteeships, Re-organizations, Receiverships and the Transfers and Registration of Stock.

Consultations, without obligation, invited.

Painting the Lily—

There are no comparative degrees of safety. An investment is safe—or it isn't.

Our First Mortgage Bonds would be safe even were they converted into notes or debentures. They are the obligations of responsible people.

But we fortify their safety by making them direct obligations secured by Detroit property worth at least double the amount of the mortgage.

And then you have the guaranty of this corporation whose resources exceed seven millions of dollars.

Yet, they pay

Financial Record Open Market

(This department has been established in order to bring together buyers and sellers of securities which are not listed or in which there is comparatively little trading. Brokers are invited to submit lists each Tuesday.)

Webb, Lee & Company, Penobscot building, Detroit, will buy, sell or quote: Detroit Mortgage Corporation 3 per cent common; Wayne County Loan & Realty Company; American State Bank of Dearborn; American State Bank of Highland Park; Michigan Mortgage & Investment; Bankers Land; Federal Discount; Michigan Finance; Union Mortgage; Detroit Mortgage; Little Wonder Glove; Koppin Realty; Keltivator Corporation; Palace Theatre; Columbia Theatre; De Luxe Theatre, J. C. Wilson Truck.

REVIVAL IN MUSKEGON

Activities in some of the factories of Muskegon have been resumed. As previously stated, the Continental Motors Corporation is adding men, but is still far from having its former normal force. The Stewart-Hartshorn Company is operating some of its departments, there being about 25 per cent of the usual force on hand, and the Central Paper Company has resumed operations with a normal force of 400 men.

MICHIGAN BRASS ELECTION

The Michigan Brass & Electric Company has declared 7 per cent cash and 6 per cent stock dividends. Officers and directors re-elected are: Claude Smith, president and treasurer; Leo G. Benson, vice-president; Harry R. Wight, secretary. The company is located in Lansing.

Public Utilities

Lansing—The Michigan Public Utilities Commission has again increased the cost of gas for Lansing consumers in response to the petition of the Lansing Fuel & Gas Company. The present rate of $1.35 for 1,000 cubic feet, with 10 cents discount for prompt payment, remains the same, but the Commission has allowed an additional service charge of 45 cents monthly for each meter, starting February 1. The company has asked for a rate of $1.70 net. The industrial net rates are fixed as follows: For first 100,000 feet, $1.25 a thousand; next 100,000 feet, $1.10; next 800,000, $1.00, and for all over 1,000,000 feet, 90 cents a thousand.

Detroit—The D. U. R. has established through service from Detroit to Battle Creek and Kalamazoo, and Detroit to Saginaw and Bay City, thus eliminating the changes at Jackson or Flint.

Lansing—The city council has indorsed the report of the committee on the municipal electric light and water equipment, approving proposed extensions and a new power plant.

Grand Rapids—The Grand Rapids Railway Company in its report covering December shows that the year 1920 ended with a deficit of $147,070, an increase of $93,342 over the deficit at the end of the year 1919. Number of passengers carried last year was 27,813,220, or 1,506,188 more than for the previous year. There were also carried 6,827,389 transfer passengers, or 153,223 more than in 1919. Operating expenses increased $4.432 during the last month of 1920, with the total expense set at $177,607, of which amount the city received the company $150,000, says the Grand Rapids News. There remains thus a difference of $27,607 which the railway company has to meet. The only decrease in operating expenses was power, which fell off $646, and general expenditures, which dropped $1,055.

Whitehall—Officers elected by the White River Power & Lighting Company are as follows: President, John O. Reed; vice-president, Edward T. Rogers; treasurer, George E. Covell.

Adrian—It was decided by the board of directors of the Adrian Street Railway Company at its annual meeting a few days ago, to engage the services of an efficiency engineer to make weekly inspections of the system with a view to improving the service, says the Telegram. No discussion as to the sale of the railway was taken up, but it was decided to operate the Adrian line as long as possible, according to Clarke E. Baldwin, attorney for the company. Those who attended the meeting are Frank R. Coates, president of the company; Directors Van Dreesen, Nicolai, Leidbetter and Wheaton, and J. Frank Johnson, one of the receivers of the Toledo & Western road.

Lansing—The Michigan Public Utilities Commission has directed 100 telephone companies in the state to report on supplies and materials purchased, where purchased and the prices of paid, statements to be made within the next 30 days. This order is part of the commission's investigation of the alleged existence of a telephone trust in the state. The order, in part, follows: "Thirty days after service on it of a copy of this order, the telephone company shall file with this commission a report showing a detailed list of all materials, supplies and equipment purchased by it, of whom purchased and the price paid therefor, and any discount or rebate received or allowed from such listed prices, and a copy of any specific contract or agreement which exists in relation to the use or disuse of any of said materials, supplies and equipment between it and any other person, firm or corporation, for the years 1918, 1919 and 1920."

Detroit—The Detroit United Railway has filed with the city council initiative petitions bearing 8,000 signatures, asking for an ordinance authorizing the service-at-cost plan of railway operation. The petitions prepare the way for a referendum.

Tecumseh—The Tecumseh Telephone Company has elected the following officers: C. F. Patterson, president; Dr. L. G. North, vice-president; C. A. Wright, secretary; F. D. Turner, treasurer; A. C. Aylesworth, manager. The same make up the board of directors.

Charlotte—The Consumers Power Company is erecting a sub-station which will increase the line voltage to a total of 140,000, as compared with 40,000 at present. This will be used to care for the local business in Charlotte, Eaton Rapids and Olivet. It was expected that the new building will be completed within a couple of months. There will be three new transformers, three lightning arresters and three oil switches.

Grand Ledge—The Grand Ledge Telephone Company now operates the local lines of the Michigan State Telephone Company, the Michigan Public Utilities Commission having granted permission to the latter company to close its plant and turn over its toll business and local subscribers.

Lansing—According to Chester Grey, manager and secretary of the Lansing Fuel & Gas Company, the high freight rates are responsible for the excessive gas rates. He declared that the freight now alone exceeds the cost of both coal and transportation five years ago. The cost of coal, coke and oil represents the chief expenses in production of gas, and the rates of the latter cannot well decline so long as the freight remains up, he declares, even though prices on commodities generally are coming down.

Detroit—The first car over the four miles of municipally owned car line on the St. Jean-Charlevoix route was operated January 16, power being supplied by the Detroit Edison Company. Regular operation will be started February 1, it is said.

Port Huron—Mayor John V. French has ordered the City Electric Railway Company not to put its one-man cars into operation until official permission is granted. He alleges that operation of such equipment violates terms of the franchise.

Cadillac—The city commission has passed the ordinance granting the optional metered water rates to the Consumer's Power Company. This ordinance is designed to give water consumers their choice of the basis of payment for service. It is effective January 24. Any consumer who elects to be served by meter instead of the monthly flat rate may notify the company and a meter will be installed at his expense. The company will refund to the consumers 40 per cent of the consumer's annual water bill until the meter is paid for, after which the measuring instrument becomes the property of the company.

LANSING CO. BUSINESS GOOD

H. E. Moore, vice-president and general manager of the Lansing Company, Lansing, maker of warehouse trucks, industrial trucks, wheelbarrows, concrete mixers and allied lines, writes under date of January 24 that the business of his company is running along in first-class shape and he has no cause for complaint whatever.

GROWTH OF STATE BANK CONTROL

Illinois will soon take second place among the states in point of number of banks under state supervision. With the recent addition of 574 private banks to the ranks of state chartered institutions, the total is 1,371. Only 24 private banks were without charters January 3, 1921, according to the state auditor. Missouri will head the list with 1,516; Illinois, 1,371; Iowa, 1,246; Minnesota, 1,184; Kansas, 1,109; Nebraska, 1,069; Texas, 892, and Wisconsin, 825. If Michigan were to add its 250 private banks to the 550 chartered banks it would rank eighth, with 800 state institutions.

Banks and Bankers

CONTINENTAL & COMMERCIAL BANK

At the annual meeting of directors of the Continental and Commercial National Bank of Chicago, January 11, Arthur Reynolds was elected president, succeeding his brother, George M. Reynolds, who becomes chairman of the board, a position created at the same meeting.

George M. Reynolds has been president of the Continental and Commercial National Bank since its organization in 1910. Arthur Reynolds has been first vice-president for the last six years. Under the new arrangement Arthur Reynolds is president and George M. Reynolds is chairman of the boards of the three banking units comprising the Continental and Commercial Banks.

In addition to the changes affecting George M. and Arthur Reynolds, the directors have announced the election of Dan Norman as vice-president. Mr. Norman served for many years as assistant cashier. The directors also added W. F. Denny and H. R. Castles to the list of assistant cashiers.

CHARLEVOIX STATE GROWS $100,000

The annual meeting of the Charlevoix State Savings Bank was held at the banking office, January 11. J. L. Crane, H. S. Harsha, A. A. Swinton, A. D. Crimins and John Burns were elected directors. The directors met immediately after the stockholders' meeting and the following officers were chosen: President, J. L. Crane; vice-president, H. S. Harsha; vice-president, A. A. Swinton; cashier, A. D. Crimins; assistant cashier, Archie Livingston.

The year just closed was the most satisfactory in the history of the bank, a growth of nearly $100,000 in deposits being shown.

NEW BANK AT CASS CITY

The Pinney State Bank has been organized to do a commercial and savings business at Cass City. The capital is $50,000 and the principal incorporators Elizabeth E. and Henry L. Pinney and Joana C. McRae, all of Cass City.

GARDINER OUT OF HOSPITAL

H. G. Gardiner, Detroit manager for Imbrie & Company, investment bankers, and who was operated on for appendicitis recently, is out of the hospital and convalescing.

BROADWAY MARKET EARNINGS

Gross income of the Broadway Market, Detroit, for 1920 was $143,680.93 and net profit $21,823.43 compared with $113,819 gross and $12,587.48 net for 1918 and $123,978.43 gross and $15,437.56 net for 1919. Stockholders re-elected Philip Breitmeyer, president; Thomas Glynn, vice-president; William A. Sanders, second vice-president; Walter G. Toepel, treasurer, and Henry S. Warren, secretary. These with Ward Lockwood, Louis Loewenstein, Louis A. Peters and Roy S. White comprise the board of directors.

ALLIS-CHALMERS' POSITION

The Allis-Chalmers Manufacturing Company, Milwaukee, reports that it has started the new year with about $17,000,000 of orders booked, as compared with $15,500,000 for January 1, 1920. All things considered, the last month of 1920 was a good one, new business having been booked at the rate of 75 per cent of capacity.

COLLEGE OF MINES HONORED

A group of mining engineers meeting in Ballarat, Australia, have selected the College of Mines, Houghton, as one of the five greatest mining schools in the world. The Houghton institution is the only American mining school selected. Two were picked from England, one from Germany and one from Australia.

Who's Who In Michigan Finance

Coorge H. Kirchner, President, First State Bank, Detroit.

George H. Kirchner, president of the First State Bank, Detroit, is another native son, having been born January 1, 1866, in a house on Congress street East, near St. Aubin avenue. His father, Sebastain Kirchner, was a dry goods merchant on Gratiot avenue between Orleans and Riopelle streets.

GEO. H. KIRCHNER

After attending St. Joseph's school from 1871 to 1880, Mr. Kirchner entered the law office of Alfred E. Hawes as an office boy and early in 1881 he got a similar job with Cleveland Hunt. However, the banking business was too much of a lure, and on December 10, 1881, he entered the employ of Vincent J. Scott, a private banker at 91 Griswold street, as a messenger. This connection was continued until the private bank failed in August, 1885. During his employment Mr. Kirchner rose from messenger to bookkeeper.

After the bank failed he obtained a situation as office man for Jeynes & Son, contractors, with offices in the old Walker block, which stood where the Dime Bank building is now, and remained with them until the City Savings Bank was organized in 1889, when he was made savings teller of that institution. On January 6, 1894, he was elected assistant cashier of the German American Bank, now the First State Bank, and rose successfully to director in 1897, cashier in 1901 and president in January 1912.

George H. Kirchner occupies a private office which can be made private when it needs to be, but the door is usually wide open and prince or pauper may obtain an audience without the use of calling cards or having credentials validated by a secretary. He is genial and frank, yet he deals direct from the shoulder and his customers in all ordinary matters get either a ready "Yes" or a deliberate and carefully contemplated "No." In foreign credits he is counted as an authority and ranks generally as one of the best money lenders in Detroit. He is interested in sixteen business enterprises either as an officer or director, principal of which are the Guaranty Trust Company, Detroit; Rouge State Bank, River Rouge; Ecorse State Bank, Ecorse; Union Mortgage Company, Detroit; Halfway State Bank, Halfway, and the United States Mortgage Bond Company. He is also a trustee of Mt. Elliott Cemetery Association. He has five children and lives at 618 Boston boulevard.

U. OF M. RETAINS WIGHTMAN

Earl C. Wightman, actuary of the Detroit Life Insurance Company, has been notified of his re-appointment as instructor of insurance at the University of Michigan. Mr. Wightman was first associated with Michigan State Life in 1913 and that year he accepted a position as actuary for the Detroit Life. Mr. Wightman has given this course in insurance accounting at the University of Michigan for four years.

DU PONT ELECTS NEW TREASURER

E. I. du Pont de Nemours & Company have elected Walter S. Carpenter treasurer to succeed Donaldson Brown, who is now associated with the General Motors Corporation.

Michigan Bank Elections

DETROIT

Bank of Detroit—James Cousens was re-elected president; James T. Whitehead, Edmund D. Fisher and G. R. Judson, vice-presidents, and R. B. Gripman, cashier.

First State—President, George H. Kirchner; vice-presidents, Paul R. Gray, Charles W. Kotcher, Abner E. Larned, Cyrenius A. Newcomb, Jr., Edward Ventasch, John Koch; vice-president and cashier, H. J. Koch; assistant cashiers, Emil Jacoth, Julius Ruhiner; assistant cashier and supervisor of branches, R. T. Kirchner; assistant cashier and manager of Gratiot avenue branch, E. C. Bloss.

Michigan State—President, Frank Schmidt; vice-president, Stanley C. Krusewiski; cashier, Frederick A. Smith.

Peoples National, Hamtramck—President, Harry J. Fox; vice-presidents, George J. Haas, John Schultheis; cashier, Charles G. Munn; assistant cashier, Joseph Carl Leszynski. Directors: Harry J. Fox, Charles A. Fields, George J. Haas, Richard L. Lawson, Neal Olson and John Schultheis.

Society for Savings—President, Fred R. Still; vice-president, Robert M. Grindley; secretary, E. R. Townsend; treasurer, Ralph W. Swanson. Directors: Robert M. Grindley, M. J. Murphy, Ralph H. Wilkinson, David W. Simons, A. A. Templeton, Henry A. Barbinowski, M. A. Moynihan, J. M. Easton, C. C. Boone, A. L. McMeans, L. B. Robertson, Tracy W. McGregor, William B. Campbell, E. B. Tyrrell, Gustavus D. Pope, Fred R. Still, Frank W. Blair, Leo M. Franklin, David M. Gray and Anthony Stefanowski.

ECORSE

Ecorse State Bank, Ecorse—James H. Means, president; Jos. Sailliotte, vice-president. Geo. H. Kirchner, vice-president; Otto Bauer, cashier. Directors, Chas. Bahlow, Elmer Labadie, H. Bourassa, H. F. Furgason, A. L. Montie, Geo. H. Kirchner, James H. Means, John S. Harry, Ignatius Sailliotte, Howard C. Wade, Jos. Sailliotte.

FLINT

Citizens Commercial & Savings—Seven new members added to directorate: Otto P. Graff, William E. Martin, cashier of the bank; Fred B. Elliott, William A. Paterson, Jr., manager; Homer J. McBride and Herbert N. Bush. Re-elected: Robert A. Whaley, Irving W. Hubbard, Alex McFarlan, Harry Winegarden, Frank D. Buekingham, Charles L. Bartlett, J. B. Burroughs, Charles H. Miller, Eugene G. Watson and Thomas Doyle.

Genesee County Savings—Directors: W. W. Crapo, H. C. Spencer, J. D. Dort, Geo. C. Wilson, E. W. Atwood, F. A. Aldrich, J. H. Crawford, C. S. Mott, J. L. Pierce, H. H. Bishop, W. S. Norton, W. O. Smith, W. C. Wells, W. R. Hubbard, C. B. Burr, M. Begole, W. Abbott Smith, Sherl Champion and A. G. Bishop.

First National—Directors: E. W. Atwood, F. A. Aldrich, J. J. Carton, Albert Champion, A. J. Bishop and James Martin.

Union Trust & Savings—Directors: C. T. Bridgman, George W. Cook, W. H. Edwards, F. H. Rankin, A. M. Davison, J. G. Windiate, C. H. Bonbright, S. S. Stewart, Belle Cox, A. A. Cummings, W. O. Smith and L. H. Bridgman.

Industrial Savings—Directors: Walter J. Schlinger, an addition; all 1920 members re-elected.

FRANKENMUTH

Frankenmuth Savings Bank—Directors: Benton Hanchett, Otto Schupp, Carl Gugel, G. H. Hannum, Arnold Boutell, W. C. Cornwell, Fred J. Fox, Louis Goetzinger, Theodore Hinkel, Julius Eidlich, Louis Mautner, E. A. Robertson, G. M. Stark, W. J. Wickes and Otto Finkbiner.

FREELAND

Freeland State—Directors: H. T. Robinson, Charles Wolcha, Herman Gross, H. J. Hesseneberg, Louis H. Sarle, G. F. Barbarin and T. J. Reavey.

GRAND LEDGE

Loan & Deposit Bank—G. N. Borry was elected chairman, and Jas. Fred L. Berry, president; E. M. Briggs, Lansing, vice-president; Martin M. Maier, second vice-president; E. F. Mills, cashier; Francis M. Hoag, assistant cashier. The other directors are D. D. Shane, R. C. Holaday, J. D. Bumpus, Charles Stranahan and E. M. Lawson. The latter two men are new members of the board.

A new bank building was arranged for. The Loan & Deposit Bank has purchased of Isaac Pierce the building and another store now stands. This will be used as a site.

Grand Ledge State—The directors re-elected the former staff: President, A. R. Gillies; vice-president, W. R. Granger; cashier, Henry D. Towne; directors, J. D. Huise, F. A. Taber, R. A. Latting and W. T. Clarke.

GREENVILLE

Greenville State—Directors: Frank S. Gibson, Charles J. Gibson, Joseph S. Gibson, Ray S. Cowin, Delmer H. Moore, Herbert J. Belknap, William H. Browne. Officers: President, Frank S. Gibson; vice-president, Charles J. Gibson; second vice-president, Joseph S. Gibson; cashier, W. H. Browne; assistant cashier, W. H. Angell.

HEMLOCK

Hemlock State—Directors: William Pahl, John C. Rauchholz, Henry Alwart, William J. Turner, J. H. Hudson, R. T. Maynard and R. B. Beaver. Officers: President, William Pahl; vice-president, John C. Rauchholz; cashier, R. B. Beaver; assistant cashier, E. B. Beaver.

HILLSDALE

Hillsdale Savings—Directors: H. S. Walworth, L. D. Wainbrith, Edwin Robins, F. M. Cook, O. J. Cornell. Edwin Robins is the new director, succeeding the late J. T. Crune. Officers: President, O. J. Cornell; vice-president, H. S. Walworth; cashier, F. M. Cook; assistant cashier, M. H. Marsh; tellers, G. H. Morgan and H. L. Van Dusen.

JACKSON

National Union—Directors: C. C. Bloomfield, A. B. Robinson, F. D. Bennett, Z. C. Eldred, A. C. Bloomfield, W. B. Field, C. B. Hayes, M. Daniels, A. D. McBurney, H. H. Stiles, R. W. Smith, Robert L. Kennedy and W. S. Cohn.

Peoples National—Officers: President, B. M. DeLamatter; vice-presidents, H. S. Reynolds and J. C. Blackman; cashier, J. F. Clary, assistant cashiers, C. H. Edgar and A. J. Whitney. Directors: E. W. Barber, H. C. Blackman, E. B. Clarkson, L. B. Cowley, B. M. DeLamatter, H. E. Edwards, H. S. Reynolds, W. R. Reynolds, Watson R. Smith, William Sparks and Mark Merriman.

Central State—Officers: President, F. E. Palmer; first vice-president, H. J. Smith; second vice-president, C. C. Loeser; third vice-president, L. R. Welcome; cashier, L. H. Ludy; assistant cashier, Leo Zeltler; secretary, Richard Prior. Directors: F. E. Palmer, L. R. Welcome, H. C. Loeser, Richard Prior, James J. Crary, W. W. Wright, R. S. Lockhart, J. O. Gilbert and Joseph W. Marks.

Jackson State Savings—Officers: President, William H. Palmer; vice-presidents, Charles M. Norris, C. C. Townsend; cashier, F. H. Newkirk; assistant cashiers, John W. Knight and D. E. Haefner. Directors: W. M. Palmer, C. M. Norris, C. C. Townsend, John J. Peek, H. H. Nessley, R. E. Ward, H. H. Corwin, H. J. Davis, A. Lockwood, J. Calkowski, W. C. Morray, W. S. Kessler, C. E. Noyes, H. T. Woodfield and P. H. Williams.

Jackson City—Officers: President, N. S. Potter; vice-presidents, W. M. Thompson, Peter B. Loomis, Edward G. Larraway and R. E. Potter; cashier, Roland B. Walker; assistant cashiers, A. H. Lathrop and W. D. Thompson. Directors: N. S. Potter, W. M. Thompson, Peter B. Loomis, W. M. Eaton, John W. Miner, H. C. Towsley, W. A. Bucknall, Edward G. Carter, R. E. Larraway, K. L. Potter, D. G. Kimball and R. J. Glasgow.

KALAMAZOO

First National—President, C. S. Campbell; vice-presidents, J. H. Dewing and F. S. Parsons; cashier, E. H. Shepard; assistant cashiers, S. A. Pratt and R. G. Rye; directors: Dr. Edward Amea, C. S. Campbell, A. E. Curtenius, James H. Dewing, B. C. Dickinson, F. M. Hodge, H. S. Humphrey, Felix Pagenstecher, F. S. Parsons, A. L. Pratt, Woodbury Rhodes, F. W. Nichols, Claire H. Stearns and A. E. Kettle.

Kalamazoo National—President, E. J. Phelps; vice-presidents, M. J. Bigelow and W. L. Otis; cashier, F. R. Eaton; assistant cashiers, L. M. Phelps, G. B. Reazor and H. Bronkhorst. Directors: M. J. Bigelow, W. L. Otis, H. A. Crawford, W. B. Milham, E. J. Phelps, F. R. Deerberger, G. G. Bard, W. E. Upjohn, F. H. Milham, H. L. Vandenberg and E. V. Brigham.

Kalamazoo-City Savings—President, Herbert E. Johnson; vice-presidents, Alfred B. Connable, Herbert W. Parker and Fred G. Dewey; cashier, Milford G. Davis; assistant cashiers, John F. Tuberty and Clarence H. Hall; auditor, Roland J. Barnard. Directors: George E. Bardeen, Charles A. Blakey, Alfred B. Connable, Charles Charnes, Charles A. Dowing, Herbert E. Johnson, William O. Jones, Lewis H. Kirby, Herbert W. Parker, Charles Locke, John J. Peck, Arthur J. Todd and George P. Wingleton.

Home Savings Bank—President, Vernon T. Barker; vice-president, Frank H. Milham; cashier, Abe Van Bochove; assistant cashiers, N. S. Pond and William F. Vanderwerp. Directors: V. T. Barker, Jos. E. Brown, C. M. Bush, Chas. Clarage, H. C. Dunbar, Frank H. Milham, Abe Lefter, W. E. Kidder, Frank H. Milham, John McKinnon, W. B. Milham, R. B. Orcutt, W. N. Pomeroy and L. Rosenbaum.

RIVER ROUGE

Rouge State Bank, River Rouge—Howard C. Wade, president; John Cassidy, Jr., vice-president; Geo. H. Kirchner, vice-president; Edward McLachlan, cashier. Directors, John Cassidy, Jr., Daniel D. Barron, Herman Goldnitz, Alger R. Reno, Howard C. Wade, James H. Means, John S. Haggerty, Geo. H. Kirchner, Wm. Chalmers.

Detroit Rock Salt Co. Nets $120,386 in 1920

The annual report of the Detroit Rock Salt Company was submitted to stockholders January 10. Earnings for the year, less depreciation and depletion, were $188,992.96, from which $55,500 bond interest and $13,106.80 reserve for taxes were deducted, leaving a net of $120,386.16. Salt produced and shipped amounted to 163,748 tons, as compared with 176,683 in 1919, the decrease being due to falling-off in orders during the last quarter. There were practically no unfilled orders on hand at the close of the year, demand being light.

The total of $55,167.45 was added to plant account during the year, being payments for new hoisting machinery, heating plant equipment, motors, crushing machinery and mine cars. Seventy-five thousand dollars was deposited with the Security Trust Company, Detroit, for redemption of bonds at par on January 1, 1921, in accordance with the sinking fund clause of the mortgage. Eight hundred fifty thousand dollars of bonds remain outstanding. A dividend of 5 per cent was paid December 31, 1920, being the second dividend of like amount paid on the common stock. The balance sheet follows:

RESOURCES	
Cash	$ 117,238.21
Liberty bonds	10,000.00
Sinking fund	75,000.00
Accounts receivable	36,757.99
Inventories	25,141.93
Plant accounts	2,584,814.37
	$2,848,962.49

LIABILITIES		
Capital stock (common)		$1,500,000.00
Bonds		825,000.00
Accounts payable		18,276.96
Reserve for 1920 government taxes		13,106.80
Surplus, Jan. 1, 1920	$352,198.62	
Earnings, 1920	120,386.16	
	$472,584.79	
Less dividend	75,000.00	
		397,584.79
		$2,848,962.49

Michigan Bond Items

The voters of Ecorse shortly will be asked to vote on the question of bonding the school district for $200,000 for a building and $60,000 for an addition to the present school.

If the voters of Ferndale approve the proposed bond issue of $150,000, which is to be decided at an election the latter part of this month, two new parks will be provided.

On April 4 the voters of Genesee county will be asked to pass on a bond issue of $3,400,000, the proceeds to be used for the construction of 150 miles of hard surface roads.

In April the people of Charlotte will be asked to decide the question of issuing $45,000 of bonds for paving purposes.

The proposition to bond Grand Blanc for $135,000 for a school building was lost at last week's election by 10 votes.

The First National Bank of Marshall has purchased the $37,500 bond issue for the Covert road to be constructed between Marengo and Sheridan townships. The bonds, which are in $1,050 denominations, will bear 6 per cent interest.

There will shortly be held an election in Ecorse concerning the issuance of $200,000 of bonds for a school building and $60,000 for an addition to a school.

The Benton Harbor board of public works is preparing an announcement to the effect that a bond issue will be required for the purpose of obtaining the money needed for the construction of a filtration plant at the water pumping station.

Gross earnings of the Detroit, Toledo & Ironton Railroad for November are reported as $481,031, as compared with $322,773 for the same month in 1919. The net operating deficit was $212,135 after taxes, as against $114,795 in 1919.

Over 8% Still Obtainable

Although the yield of good bonds is gradually decreasing it is still possible to invest in the more conservative type of mortgage obligation at prices which provide 8% and better.

For an example ask for our Circular No. F-4.

The Needs of the U. of M.

(*Continued from Page 9*)

of this discussion. The point it is intended to convey is that University Hospital is dirty beyond necessity, despite the fact that it is overcrowded, that many things are tolerated by its administration which would cause the officers in any private institution to do a lot of explaining. One of the sections exhibited to visitors is the building where expectant mothers are cared for and where their little ones are first brought to see the light of day. It is an old cottage, full of creepy stairs and small rooms and dingy corners, with too many women in each room. The kitchen has an old table on which is a badly worn and stained covering of white oilcloth. It is hard for anyone to conceive that the need for space is so tremendous on the campus that this old building is the only one of the university's properties that can be dedicated to this purpose. A regular hospital wing may not be necessary, but surely there must be something better than what has been set aside for these young women of the state, who cannot afford to pay for medical care. The University Hospital limits is better cared for than these patients. There is one case of a girl who walked across a railroad track on the way to the hospital to be delivered, and who stumbled and broke her leg. It leads one naturally to question whether or not a girl in that condition might not have been able to receive a helping hand which might have avoided that accident. She is exhibited to visitors as if it were the taxpayers' fault that she was injured.

Other Unsighly Spots

There are other parts of the University hospital that are not pointed to with pride. One is the dermatology ward, where social diseases are treated and studied. The state of Michigan has asked the University to install this department and many cases are cared for there, as well as cases that come to the campus. Little advantage seems to be taken of the fact that the frankness and violence with which social diseases have first attacked has proved almost the only blessing to mankind that came out of the war. Not only the state, but the United States Public Health service as well, is conducting a vigorous warfare against man's greatest scourge. The University of Michigan hospital should be one of the strongest forts in defense of humanity against this plague. Its attainments, except for one or two conspicuous instances, are negligible.

The medical profession has taken the position that the University Hospital belongs in Detroit or some other large city where there are better clinical opportunities. It also has informed Dr. Burton with regrettable frankness that the institution should care for indigent patients, leaving the profitable ones to the finished members of the profession, so that campus doctors might not earn too much money. These are some of the opinions which Dr. Burton's demands have brought into the fresh air for the first time in a long while. The fact of the matter is that there is only a small percentage of the taxpayers of the state who would send their sick to the University Hospital if they could afford to pay. They might desire the services of some physician identified with the University, and there are many whose attainments have traveled far, but they would scarcely come to the University hospital for that attention, but would seek one of the many private institutions maintained in the city for just that purpose.

Another question which Dr. Burton will have to answer many times has to do with student fees. Many persons, particularly farmers, object to the large percentage of students from outside of Michigan and the United States who seek our university for their study. Non-resident students now pay $140 a school year in tuition, which is considered too low. Dr. Burton is authority for the statement that this could be raised if desired and the tuition for state students lowered if necessary. He is firm, however, in the attitude that nothing should be done to discourage outside students, because of the opportunity they give the others to rub shoulders with the children of the whole world. There is not a nation or continent but has boys and girls at Ann Arbor.

Aside from the fact that these young people contribute to the general congested condition, this can have little to do with the University building program. There are more Michigan students attending colleges outside the state than there are other young people at Michigan. This is probably true of every large institution. The most important factor in the selection of a university for many young people is that the subject or science in which they desire to specialize has an authority somewhere whose fame has reached them. Family reasons also make a difference and causes many fathers and mothers who are no longer residents of Michigan to send their sons and daughters to Ann Arbor. These considerations will be followed regardless of what rates are established. Further, no matter what fees are assessed, the state cannot expect to receive the full expense of education from its students, anyway. Perhaps much of this cost is returned to the University in after years in the form of gifts and scholarships from its sons and daughters who become successful in business and professional life.

We have said that the University is down at the head. Taking the $500,000 appropriation for buildings, here are some facts: The first item is for $900,000 for the first section of a general building for the Literary College, which, when finished, will be the largest unit in work. This study is now pursued in the old main building, entirely inadequate, and in West Hall, an old structure condemned and rickety. The proposed building would front on State street, starting on a line with Alumni Memorial Hall, take part of the ground now occupied by the Museum and end on the line of the main building. It is planned to be sufficiently adequate so that it would not need to be enlarged for several years. It would be six stories high, the upper two of which would be for storage purposes which would give them some privacy, now denied them.

The museum has a priceless collection in a structure perhaps the most unsuitable on the campus since the removal of the old dental buildings. The building is a firetrap and the exhibits are crowded so that they are difficult of access to students. Another $900,000 is asked for this structure.

Engineering shops and laboratories, costing $1,500,000, are required. These Dr. Burton would build on a site owned mostly by the University of Michigan Athletic Board. Plain factory type units are proposed. The present engineering building was constructed to accommodate 1,000 students and now cares for more than 3,000, with some 900 alone in the old boiler room and in a low frame building erected by the Student Army Training Corps.

Eight hundred thousand dollars is asked for a new physics laboratory, the present building having been outgrown, both as to facilities and the development in the science demanding new apparatus and equipment. The medical building necessities are set at $900,000. This is badly needed by the great medical school developed by that department, and which now is crowded by beginners in medicine. It is here that most of the intensive work in medicine is done. Dental students need this department in addition to their own, although the dental building is one of the very well equipped recent structures on North University avenue. Then $350,000 is wanted for completion of a model high school for training high school teachers. This probably is intended to supplement the appropriation made in 1919, which now may not become available. The present enrollment of students desiring to train for teaching high school subjects is negligible. Dr. Burton is authority for the statement that the University is asked by the normal colleges to train high school teachers and leave to them the business of preparing teachers for primary grades and special subjects.

An addition costing $200,000 is asked for the College of Dentistry, which, probably is wanted merely to increase the facilities, as this department is now well housed. Four hundred thousand dollars for a chemical laboratory would increase the facilities which are used by several departments, and $40,000 for a biological station at Douglas Lake, which speaks for itself.

State Has Not Been Niggardly

The University asks, further, $1,200,000 to purchase land. This would provide funds for condemnation purposes of small parcels mostly, as much ground already has been absorbed from time to time by the school and will be used for the structures proposed. It would be necessary to open a street for a short distance to make the proposed engineering units and the new hospital wings more accessible, and there are other plots needed which, Dr. Burton says, can be procured at reasonable figures.

Contrary to many views, the state of Michigan has not been niggardly with the University in the past. The taxes set aside for maintaining the school, exclusive of buildings, increased 53.4 per cent from 1909 to 1918, inclusive, jumping from $863,237 in the former year to $1,241,500 in the latter. Aside from the revenue raised by the mill tax last year, the Legislature by making immediate appropriations made the following appropriations in 1919:

To complete the new library.....	$200,000
For the new hospital, 1919-20.....	150,000
For the new hospital, 1920-21.....	150,000
Teachers' high school, 1919-20.....	100,000
Teachers' high school, 1920-21.....	200,000
To cover deficit in running expenses..	360,000

Just what the Legislature will do is problematical. Our guess is that the University rather will receive about $5,000,000 for buildings this session or else about $15,000,000. A bond issue would not be beyond expectations and discovery of new sources of revenue may have some effect on the situation. The Legislature will not act until the requirements of all the other state institutions—educational, penal, corrective, etc.—have been placed before it, and then the problem will have to be considered in its entirety. No reliable suppositions can be drawn until then. The decision to be given by the Legislature to determine, according to its wisdom. Meanwhile Dr. Burton is mustering all his strength and with commendable energy and frankness is telling the people of Michigan what they have to do if they want to keep their university first class.

Dr. Burton probably will be made to realize that the taxpayers are not interested in having this university the greatest in the country nor the largest, nor will they concern themselves particularly with the relative standing of public institutions supported by tax money as against highly endowed centers of learning, such as Yale and Harvard. That is a question for educators which will not be a part of this discussion to any great degree. He can trade on the pride which the state feels in its great school. Whatever this Legislature does, whatever Dr. Burton says, there will be a university at Ann Arbor for many years. Eventually it will be built up as it should be. Let us hope that a good start is made this year.

How Michigan Casts Its Metal

(*Continued from Page 12*)

begins to flow, this is plugged and the charging continued, the molten metal accumulating in the hearth until it is tapped for use. Coke is practically always used for fuel, and the air blast is supplied by either one of two devices, i. e., a centrifugal fan or a blower.

When the molds are ready and a sufficient amount of iron has been melted, the plug is removed from the tap hole and a flow of iron started. Ladles are placed under the hole to catch the white-hot metal, and as soon as they are filled they are carried away and the iron poured into the molds. In the larger foundries the iron from the cupola runs into huge pots which are picked up by overhead cranes or trolleys and carried to the several sections of the shop where the iron is poured into hand ladles and thence distributed to the molds.

It sometimes becomes necessary to make a casting which shall be very hard, for the purpose of resisting friction or for some similar reason. As a rule it is only the external portion of the casting which has to be chilled, so that the problem is to cool that part of the casting as rapidly as possible. This is done by using a mold which is made either wholly or partly of iron, which carries the heat off rapidly.

For some purposes, particularly for small parts of machinery which have to bear considerable stress, ordinary cast iron is too brittle and has too little tensile strength. In such cases malleable iron castings are often used. The iron from which these castings are made is known as white iron and contains chemical elements which make it very hard and brittle. The castings are packed in an iron box, the packing consisting of sand, fire clay, hematite ore, magnetite (which is another form of iron ore), or some similar substance, and are then placed in an annealing oven, where they are heated until certain chemical changes have taken place. After annealing, the casting can be twisted, bent and hammered, and its strength is more than doubled. The resistance to shock of the average malleable casting is about eight times that of gray cast iron and half that of steel. For frequently repeated light shocks, a malleable casting is superior to one made of steel.

Some Michigan Foundries

One of the largest gray iron foundries in Michigan is that of the Saginaw Products Company, at Saginaw. The foundry building, which is divided into four bays, is 490 feet long and 164 feet wide. Four cupolas are provided for melting the metal, three of which are alike, with 90-inch shells lined to 65 inches at the bottom, and one which is 56 inches in diameter lined to 40 inches. It is calculated that when fully charged each cupola weighs 130 tons. The blast is supplied by three No. 6½ positive pressure blowers. Each blower is driven by an individual 75-h. p. motor, and runs at a speed of 175 R. P. M., delivering 8,300 cubic feet of air a minute. The large castings are cleaned by using two sand blast units. The plant employs 900 men when operating at normal capacity, producing more than 200 tons of castings daily. Thirty-two core ovens are required for baking the cores. These ovens are arranged back to back with eight in a row, making two batteries of 16 each. Each oven is 12 feet by 6 feet 6 inches by 7 feet high. The firebox for the ovens is located in the basement. A pyrometer is attached to each oven in order that they may be maintained at the proper temperature and a record kept.

The Ford Motor Company recently has completed the erection of equipment whereby the hot metal can be poured direct from the fur-

naces into the molds without first having to be run into "pigs." Cupolas have not been eliminated entirely, but the metal from the blast furnaces is mixed with metal from the cupolas in the correct proportions for the production of high grade castings. The foundry building is 1,188 feet long by 660 feet wide, and is equipped with 18 cupolas arranged in three batteries of six each.

Metal from the blast furnaces will be taken to the foundry in ladle cars and poured outside the foundry in a 30-ton ladle, or hot metal container, one of which is provided for each battery of cupolas. From this ladle 1,500 to 2,000 pounds of the furnace metal will be poured into a foundry ladle and the ladle taken to the cupola, where the required amount of cupola metal will be added. The cupola metal will consist largely of scrapped castings and borings from the machine shop.

From the illustrations and meager descriptions available, it is evident that up to the last few years very little progress has been made in the methods of casting copper and its alloys. The type of brass furnace most generally in use is the "crucible furnace," of the square, natural-draft pit type, usually built so that the top of the furnace is at or near the level of the foundry floor. It consists of a sheet iron shell, lined with fire bricks, resting on a bed-plate and fitted with a cast iron cover. A hole is cut in near the top of the furnace, so that the gases of combustion are carried off at the side, and thence up a chimney. The grate bars usually are set from 12 to 18 inches above the bottom of the pit, thus leaving room for ashes in the bottom. The fire is started on the grate bars, and after it is well under way the crucible is set in on top of the fuel.

These crucibles ordinarily are made of clay and graphite and usually have a capacity of from 160 to 300 pounds of metal. A "charge" of metal is now put into the pot and heated to approximately 2,000 degrees F., after which it is pulled out of the pit and carried away to be poured. A crane or chain-fall is used to remove the pot from the furnace. The crucible must be removed from the pit at exactly the right moment, because if it remains too long in the fire, the metal will become overheated and the zinc portion of the alloy will be burned away. If the metal is poured before it has reached the proper temperature, the metals will not fuse well and a poor casting will result.

The last few years have seen the development of the electric furnace, several different types of which are now on the market. These are rapidly displacing the pit furnaces in the larger foundries. In the Chas. B. Bohn foundries a battery of six electric rocking furnaces is employed, each of which melts 2,000 pounds of brass at one heat. This furnace is similar in appearance to a large drum, and consists of a steel cylinder 68 inches in diameter and 60 inches long, lined with fire brick, and having an opening in the side through which the metal

ELECTRIC TILTING FURNACE

This machine, which is part of the equipment of the Charles B. Bohn Foundry, Detroit, melts 12,000 pounds of brass daily.

is put in and poured out. The metal is melted by the heat from an electric arc which is produced from two graphite electrodes, one of which enters from each end of the furnace. The electrodes are four inches in diameter and are set so that the points are from one to one and one-half inches apart. The current is 115 volt A. C.

Around each end of the furnace is a steel band which acts as a track for the rollers upon which the furnace rests. The furnace is also encircled by a ring gear at each end which is meshed with a small gear. Power is supplied from a 2 h. p. motor through a worm gear and wheel to the small gear, which as it revolves, also slowly revolves the furnace, rolling it around until the opening in the side comes down nearly to the level of the molten metal. At this point a contact breaker reverses the motor, rolling the furnace in the opposite direction, and the operation is repeated. The ring gears are eccentric with the circumference of the furnace, the eccentric coming on opposite sides, so that as the furnace rocks, it also tilts endwise, completely stirring the metal. Thus the constituents of the charge are thoroughly mixed, the metal is heated rapidly without danger of oxidising and volatilising, and absolute uniformity of temperature is insured. The average net metallic loss is one per cent with yellow brass and one-half of one per cent with red brass.

The metal is poured from the furnace into a crucible, or pot, which has been heated to a high temperature. It is obvious that if the molten metal were to be poured into a cold pot, not only would the temperature of the metal be lowered thereby, but the pot might be cracked and ruined. So while the metal is melting, the pots are being heated. This is done by means of a "pot heater," which is a gas fired oven with an open opening downward, through which gas is forced. This gas is lighted and the pot placed nader it, so that the flame will strike downward into the bottom of the pot. The pot is heated in a very short time, and then when the metal is poured into it, the heat is retained.

Another form of furnace has been designed to melt either copper, brass or aluminum, and is becoming very popular in aluminum foundries. The furnace consists of a steel shell, lined with bricks or fire clay, with room in the center for the crucible. The crucible is not removed from the furnace when the metal is to be poured; instead, the furnace is tilted and the metal poured into another crucible, in which it is carried to the mold. The furnace is supported by trunnions in a steel framework and is tilted by means of a hand wheel which operates a set of gears. Furnaces of this type burn either oil or gas, the burner being placed so that the flame enters through a hole at one side near the bottom of the furnace, practically enveloping the crucible.

Rules to Follow in Filing Tax Returns

(*Continued from Page 13*)

taking into consideration the inventory at the beginning and end of the year. Other items that may be included as business expenses are reasonable compensation for the services of officials and employes, advertising and other selling expenses, together with insurance premiums against fire, storm, theft, accident or other similar losses, and rental for the use of business property.

A taxpayer may deduct the necessary expenses paid in carrying on his business from his gross income from whatever source. In computing net income upon which the tax is assessed, a deduction for business expense or a disbursement or charge must have certain qualities in order to be allowed. It must relate to a trade, business, profession or vocation, "carried on" by the taxpayer in which he has invested time and money for the purpose of a livelihood or profit. A business is being carried on by its owner, even though all its activities may be conducted by employes.

The deduction must be a "business expense" and not an "investment of capital." Amounts expended for the erection of new buildings, installation of machinery and the purchase of tools or implements of permanent value do not constitute business expenses, being merely a change in the form of capital and not a reduction of wealth. Expenditure for property which is used up in the course of the year may be deducted as a business expense.

Many representatives of business houses will be benefited by a recent Treasury decision relative to traveling expenses. Reasonable and necessary traveling expenses include railroad fares and meals and lodging. A traveling man, working on a salary without reimbursement for traveling expenses, or employed on a commission basis with no expense allowance, may deduct his expenses for railroad fare and also his expenses for meals and lodging in an amount in excess of the ordinary cost for such living expense when at home.

If he receives a salary and is repaid his actual traveling expenses, he must include as gross income an amount equal to the ordinary expense for meals and lodging when at home, as such amount is held to be additional compensation to the taxpayer.

Numerous errors relative to claims for deductions for losses have been discovered in returns of prior years. To be allowed, deductions for losses must be confined to the following classes: Losses suffered in trade or business; losses in transactions entered into for profit though not connected with a trade or business losses of property not connected with trade or business if arising from fires, shipwreck, storms or other casualty, or from theft. To the extent any of these losses are compensated for by insurance or otherwise, they are not deductible.

A common loss of a person engaged in business is the destruction or theft of merchandise. A merchant who uses inventories to ascertain his profit should not make on his books entries for any of his stock in trade that is destroyed or stolen, for the reason that such loss will be reflected in his closing inventory. If his books are kept on a cash basis which properly shows his correct profits, he may deduct specifically the amount of his loss. In either event, if the merchant receives insurance for such losses he must include in his gross income the amount of such insurance.

Loss of cash by burglary or embezzlement may be deducted by entry debiting profit and loss and crediting cash. The amount of such loss should be reduced by the amount of insurance covering it and by the reasonable value of any claim against the embezzler or his sureties which have an ascertainable value such as a claim against the surety company. A loss incurred through embezzlement is an allowable deduction from gross income only for the year in which the embezzlement occurred.

Bad debts form an important item in the returns of many business men. Claims for

such deductions must have certain qualities. The debt must have been charged off within the year in which its worthlessness was discovered; the return must show evidence of the manner in which discovery was made; a statement should be made that the debtor has been discharged in bankruptcy or has disappeared, leaving no trace, or that the ordinary means of collection have been exhausted.

Where the creditor continues to extend credit, a debt may not be claimed as worthless. A debt may not be charged off or deducted in part, but must be wholly worthless before any part can be deducted, though it may be clearly worth less than the face amount. If a debt is forgiven, it cannot be deducted because it is then regarded as a gift.

The Revenue Act provides in relation to deductions that a reasonable allowance may be made for the exhaustions, wear and tear of business property. This applies to buildings and equipment, such as motor trucks, horses, delivery wagons or machinery.

Return of individual income if the net income was $5,000 or less must be made on Form 1040A. If the individual net income exceeded $5,000 the return must be made on Form 1040. If the business is operated by a partnership a return must be made. From 1965, even though the firm had no net income for the year.

Partnerships as such are not subject to the income tax, but individual members are taxed on the distributive shares of net income from the business, whether distributed or not, and are required to include such shares in their individual return, even though they may not have been actually received. Similarly, if a business is incorporated a return must be made on Form 1120, regardless of its net income.

Forms for making corporation, partnership and individual tax returns are now available at offices of collectors of internal revenue. Copies will be mailed by collectors to persons who filed these returns last year. Failure to receive a copy however, does not relieve a taxpayer of his obligation to file a return on time. The period for filing is from January 1 to March 15, 1921. This year, at last, the tax may be paid in full at the time of filing the return or in four equal installments due on or before March 15, June 15, September 15 and December 15. The return must be filed with the collector of internal revenue for the district in which the taxpayer resides or has his principal place of business. Heavy penalties are provided by the revenue act for failure or willful refusal to file a return and pay the tax on time.

Michigan and the Open Shop

(Continued from Page 14)

man could lay 2,025 bricks a day, and he was a master at straight wall, corner or any other branch of his trade.

"He gloried in his reputation as a workman. He was not the type of man whose ambition prohibited him, or whose education classified him for self-development to industrial or business leadership, but he was a darn good bricklayer. He had a son who viewed bricklaying with the same enthusiasm as the father. The boy wanted to learn to lay brick like his father. The father determined to give the boy the proper training. To this end he had the brick and mortar and set the boy to work in the back yard.

"The boy took to the job like most boys take to marbles. He built walls which his father kicked over as poor work, but in time the youngster learned the trick and when 17 years old went out to earn his living as a bricklayer. With the training he had from the same love of his trade as his father had, the boy soon equaled his dad's record. Then the union began to notice him and before long the business agent visited him on the job and informed him that 600 bricks a day was the union limit, and he must hold to it or quit the trade.

"The boy told his father of the warning and the father said this: 'My son, when an organization or any person tells you how many bricks to lay, it is time to quit the trade.' And the boy quit the trade. The building trade lost a good bricklayer just as industry has lost many a good mechanic through this new union-bred theory of limited production and limitless wages.

"The manufacturer cannot go before the public and say to the worker: 'You must not organize,' any more than the worker can say to the manufacturer: 'You must not organize.' Capital has organized; therefore labor has the same right. The union worker, once he has become an employer, immediately becomes identified with the organization which represents his business. The mistake labor organizations have made and are making is that they have devoted too much time to dictating to the member how and where he shall work and not enough time to making him a good workman.

"Had as much time been given to training their members for their chosen trade as has been directed toward setting their wages, hours of labor and their conduct while at work, the unionized workman would be no much superior to the unorganized man that the closed shop would have become the accepted rule in industry. Industry goes to the best technical schools to get its technical workers. By the same token it would go to the union to get the best workmen if high grade mechanics were the basic union principle.

"Unfortunately, labor organizations have operated as leaders, promoting the indifferent workman against the ambitious, skilled comrade, and setting a low scale of achievement to create the largest organization possible and gain the greatest political power.

"We are entering an industrial era which will call for high production. There also will be a reduction in wages. Michigan manufacturers view with disfavor the wholesale slashing of wages by some employers. They likewise condemn an attitude such as was reflected in a statement made recently by an employer when he said: 'We have labor in our power now and it will take what we give it.'

"Such a statement or such an attitude if mind is as serious a menace to industry as the most radical utterances from the I. W. W. or the anarchists. It is such mental conditions on the part of employers that have fanned the flame of radicalism among the misdirected workers. The prominence of manufacturers in this state has satisfied them that the open shop is not only true Americanism, but is likewise the best for the welfare of worker and employer alike.

"Years ago the foundry business in this city was a closed shop proposition, and it is the report of the men then in the harness, and some of whom are still at their desks, that there never were as many strikes before or since. If freedom of contract, freedom of movement and the right to work where, when and how they pleased were not the desire of the workingmen of this state, Michigan would today be as widely recognized as a closed shop state as it is as a good state to work in, to live in and to build industries in."

Making Steel In Four Hours

(Continued from Page 8)

and grades of steel, the machines with which the parts are made are built of steel, as are sewing machines, typewriters, office furniture—practically everything one touches is made of steel or has steel in it. And if by Dr. Robert's process huge quantities of ore which hitherto have been "scrapped" can be utilized and the whole process of making steel made easier, quicker and much cheaper, another great step forward will have been made in the development of industry and civilization.

The Robert company is planning to develop its plant on a large scale. F. P. White, who is acting as special representative, arrived in Detroit last week for the purpose of interviewing some of Michigan's greater industrial leaders. His plan is to enlist co-operation of some one of the larger industrial enterprises of the state, one which uses steel of all kinds and in sufficient quantities, so that the entire output of the proposed plant could be absorbed or handled by it. Mr. White says that this is not a stock-selling proposition; all that his company wants is the assistance of an organization or an individual who will supply the machinery necessary for the enlarging of the plant and take the entire output or a large part of it.

Mr. White is making his headquarters at the Henry Clay Hotel, Detroit, where he has samples and results of tests of the different kinds and grades of steel produced by the Robert process, together with photographs of the present plant and equipment. He hears credentials from Seattle business men and from some of the foremost metallurgists and manufacturers of the country.

MEAD JOINS AUTO SCHOOL

John H. Mead, formerly advertising manager of the Detroit Garage Equipment Company, has become associated with the Michigan State Auto School as manager of its student's service and supply department. Mr. Mead has had a long experience in buying and selling auto motive equipment, tools and materials.

TO MOVE OFFICES TO WISCONSIN

At the annual meeting of the Turtle Lake Lumber Company, Grand Rapids, it was announced that the company would move its general offices to Winchester, Wis., retaining, however, legal offices in the Michigan Trust building, Grand Rapids. The officers elected for the year are: William E. Vogelsang, president; Henry Idema, vice-president; George B. Dennis, secretary-treasurer and head of the legal department, and Edna M. Butler, assistant secretary.

FOURTH DUDLEY PAPER BRANCH

The Dudley Paper Company, Lansing, will open an office in Jackson, making four branches in Michigan. The company has selected the following officers: President, W. C. Dudley; vice-presidents, C. C. Woodruff and R. Guy Bronson; secretary, F. J. Weissinger; treasurer, C. M. Howland. These men and C. A. Willemin, R. A. Reed, L. C. Wonch, I. M. Buck and J. A. Church comprise the directors. The board authorized a 10 per cent cash dividend to be paid quarterly. Reports of officers showed increases in sales of 55 per cent.

FURNITURE PAYROLL INCREASE

The Furniture Mutual Insurance Company, Grand Rapids, announces that the 52 member factories paid premiums in 1920 based upon a total payroll of $14,697,070, in 1919 the premiums were paid on a total payroll of $10,418,815.

Ford's Campaign for New Money

(*Continued from Page 8*)

believe that the motor king could ever find himself short of money. And yet that appears to be the situation. Financial men say that he has "spread his cash assets out so thin" that it is no small wonder that, with the business depression which has cut motor car sales to the minimum, he should be short of working capital. His present difficulties are said to be due not to the fact that he is any less wealthy than he ever was, but that his assets have become non-liquid—tied up in plants and real estate, cars made or in process of manufacture, but unsold, and in other investments on which it is impossible to realize immediately. The money he is seeking in New York is to meet maturing obligations and as funds with which to resume manufacturing operations, so the story goes.

How It Started

The Ford troubles are said to have started when Mr. Ford bought out the minority stockholders. In so doing he over-reached himself, bankers say. Consider the amount of money he found necessary to acquire the holdings of his associates. James Couzens is reported to have received $37,000,000 for his stock; John F. and Horace E. Dodge, $27,000,000; the Gray family $27,000,000, and Horace H. Rackham and the other smaller stockholders $1,500,000, making a total of $92,500,000. As part of the money with which to complete this transaction, the Ford Motor Company was said to have had at the time $42,000,000 of cash assets, leaving $50,500,000 to be obtained elsewhere.

The company went into the eastern financial market and got a loan of $60,000,000, of which about $10,000,000 would have remained, had $50,000,000 gone to help pay off Mr. Ford's former partners.

Not long afterward came the Ford purchase of the Detroit, Toledo & Ironton Railroad, for which approximately $5,000,000 was paid, and of the timber and mine lands in the Upper Peninsular of Michigan, which required $3,600,000. So that the total of disbursements was $101,100,000, as against the total of $102,000,000 of cash assets and the loan.

Financial men who have been figuring on Mr. Ford's investments in this direction say he counted on his usual turnover from sales to provide him with enough working capital, and they put forth the theory that partially all of the earnings of his organization from the time of the purchases mentioned until the time when sales began to fall off, went to reduce the Eastern loan and back into the business, particularly into plant construction in the River Rouge district. Ford's conversion of raw materials into cars has always been so rapid that the motor king has been enabled to make investments in permanent improvements out of his bank balance rather than by the usual methods of long-term loans. Always having been his own banker, and having been told by the press that his business was different from everybody else's, it is fair to assume that he went into the depression figuring that the gods would spare him and that the cut in prices of his cars would maintain that steady stream of cash income which he had always enjoyed.

When, however, the market for all makes of motor cars dried up, the Ford along with the rest, all of Mr. Ford's calculations were upset. Today, if reports are to be believed, he has reached the point where he must call for help upon the Wall Street which he has so vigorously attacked in other days.

Mr. Ford, as was said in an earlier paragraph, is reported to be maintaining that he needs only $75,000,000, while Mr. Stettinius, of the House of Morgan, is declared to have put the figure at $116,000,000. In what way may Mr. Ford have arrived at his total, and how Mr. Stettinius at his? A conservative Detroit banker took his pencil in hand.

"It is reasonable to suppose," he said, as he wrote down the figure $30,000,000, "that the Ford Motor Company has that much in short-term liabilities, and by that I mean acceptances and obligations it has given for materials received. The balance on the former loan is $25,000,000, and while that was renewed on January 16, for three months, there is the probability that Mr. Ford is making provision in the new loan to pay that balance off at maturity. Then possibly $20,000,000 is represented in purchase contracts, by which I mean contracts the company has with suppliers of materials and which must be carried out within the next few weeks or months. That makes the total $75,000,000, the one Mr. Ford is reported to have fixed.

"But the chances are that Mr. Stettinius added another item of some $40,000,000 which Mr. Ford had left out. This total, which represents cars completed or partially completed, but not sold, is a non-liquid asset, which Mr. Ford probably will need when he resumes manufacturing. He will have to throw it into the pot right away, so to speak. In normal times, of course, when cars are being sold as fast as they leave the factory, there is no such amount tied up. Thus the difference between Mr. Ford's estimate and Mr. Stettinius' probably lies in their divergence of views as to how soon sales will pick up, or it may be that Ford's cash assets are greater than might be supposed, although I have been reliably informed that whereas he usually carries in the neighborhood of $150,000,000 in bank, he has drawn down to $2,000,000 now."

Just who is acting as the Ford agent in the loan negotiations has not been disclosed, although it is reported that E. G. Liebold, general secretary to Henry Ford, was the first on the ground. On his failure to conclude satisfactory arrangements, it is said that Frank L. Klingensmith, until recently vice-president and treasurer of the company, was sent to New York. His failure, so one report has it, resulted in his leaving the fold.

The terms set up by the New York bankers are said to include the selection of a new treasurer for the Ford Motor Company, a man of the banks' own choosing. In this connection the name of Mr. Bower, of the Liberty National Bank, is most often mentioned. Mr. Bower, incidentally, was in Detroit two or three weeks recently, but whether he was here in connection with the loan negotiations has not been announced.

If it eventuates that the bankers put their own representative in the Ford organization, the question arises as to how Mr. Ford will accept the restraint on his own free action which such a situation would impose. In the early days of the Ford Motor Company, so far as public knowledge goes, Mr. Ford and the men associated with him in the management of the business got along peaceably enough together. It was in those days first that the foundation was being laid for one of the most phenomenal commercial successes ever recorded, and, latterly, things which previously unheard-of profits were being made. Later on, however, when the enterprise had succeeded beyond the fondest dreams of its owners, dissension arose, which resulted, eventually, in the withdrawal of the Dodges and then Mr. Couzens, and, finally, in Mr. Ford's outright purchase of the holdings of his associates, so that he would not be opposed at any stage of the game. How he will get along with outside interests remains to be seen, if indeed the necessity arises.

A man who is credited with having been in good measure responsible for the success of the Ford Motor Company, but who some time ago withdrew because of differences with others associated in the management, has tendered Mr. Ford his services for one year, without charge, to help put one of the important ends of the business "back on its feet," so he expressed it. Recently this man wrote Mr. Ford a letter, making such an offer. Up to a short time ago he had not received an answer.

"Henry Ford made me a millionaire several times over," this man told a friend, "and now when I believe he needs help I think I owe it to him and to the city of Detroit and the automotive industry in general to do what I can to assist him. I explained in my letter that I didn't want any more of his money. I have enough."

"Bad Advice"

In the course of this conversation the man expressed the opinion that Mr. Ford had made a mistake in allowing the "old guard" who came up the ladder with him to leave his organization. He had reference, no doubt, to C. Harold Wills, John R. Lee, Norval A. Hawkins and one or two others who had been with the Ford Motor Company almost from the days of its infancy. He said he believed Mr. Ford had been listening to bad advice from the men who now stand high in his favor, two of whom he mentioned by name, and he said he thought the company would get back into its stride much more quickly if these men were displaced.

In view of the fact that it is from the House of Morgan that Mr. Ford is said to be about to obtain the loan, the question has arisen based no doubt on the General Interest in the General Motors Corporation, whether the Ford company may eventually become a subsidiary to GMC. Men who recently have been in touch with some of the higher officials of General Motors say nothing of the sort is to be expected. They profess to have been assured that the GMC has no desire to add the Ford to its string, inasmuch as the latter does not fit into General Motors' scheme of manufacture. They say that if Morgan makes the loan to Ford he will make it as Morgan, Banker, and not as Morgan, Power in General Motors.

Another House Reported In Goodyear Financing

The Cleveland Plain Dealer has the following to say about the refinancing of the Goodyear Tire & Rubber Company:

"The rumor concerning the Goodyear financing carried by brokers wires out of New York says: 'A banking house whose name heretofore has not been identified with Goodyear affairs is known to have entered the situation and is about to underwrite an issue of first mortgage bonds which it is proposed to put out for the purpose of caring for secured creditors.

"'The plan also calls for an issue of junior securities which will take the form of 20-year debentures and another security which probably will take the form of first preferred stock which will be offered to the unsecured creditors.

"'According to the provisions of the plan, these three issues will aggregate $80,000,000. According to those who are familiar with the details, the banking house which has become identified with the Goodyear situation is willing to underwrite the issue of first mortgage bonds, if the unsecured creditors are willing to accept, in lieu of their obligations, from the company part debenture bonds and part first preferred stock which it is proposed to issue.'"

BASLE'S FIFTH SAMPLE FAIR

The fifth Swiss Sample Fair will take place at Basle, its permanently allotted domicile, between April 16 and 26. The chief object of this trade exhibition is to stimulate already existing business relations; to afford opportunities for the making of new connections and to give the public in general a better idea of the nature, extent and progress of home manufactures.

Only Swiss firms and products manufactured in Switzerland are eligible for this Fair. In case of corporations, the majority of the management and at least half of the capital must be of Swiss origin and their chief seat must be located in Switzerland.

Among the goods featured in the exhibition are the following: Articles of food and luxuries, drugs and chemicals; house and kitchen utensils, household goods, glass and china; fittings for apartments; furniture and basket goods, heating, light and sanitary fittings; technical articles in metal, wood, glass, cork, leather, india rubber, etc.; office and shop fittings; drawing and painting utensils; paper manufactures and graphic arts; musical instruments, articles of sport and toys; artistic industrial articles; clocks, watches and jewelry; textile goods, clothing and outfitting; machinery and tools; fine mechanical instruments, instruments and apparatus; electrical industry; raw materials and building materials, agriculture and horticulture; sundries.

The first sample exhibition was held in 1917 and had 300,000 visitors and sales were effected for between $3,860,000 and $4,825,000. The second Fair closed with sales amounting to more than $7,720,000. The third exhibition in 1919 realized $9,650,000 in sales, and the fourth, in 1920, proved equally successful.

BEET GROWERS MEET FEB. 2

The Michigan Sugar Beet Growers' Association will hold its annual meeting in East Lansing, February 2, Farmers' Week. Owing to the unsettled condition of the sugar industry, growers are advised by the officers to defer consideration of contracts until after this meeting.

Aladdin

Employees of Bertha Coal Co. Get Aladdin Read-Cut Houses

Many firms are confronted by problems of Industrial Housing such as were satisfactorily solved by the Bertha Coal Company, of Pittsburgh, Pennsylvania, when they decided to provide a number of Aladdin Readi-Cut Houses for their employees.

This is but one of the many instances where the Aladdin service has solved the housing problem. Better houses, lower in price, more quickly erected, these are the expressions of satisfaction we hear from every customer. Many firms will find it advantageous to take similar interest in housing their employees. For obtaining quick service, guaranteed complete delivery, best quality material and all-around satisfaction, bring that housing problem to *Aladdin*.

When you are ready to consider your housing problem bear these facts in mind.

Aladdin—

—expedites your building project—
—houses your men well and quickly—
—saves 18% of the cost of lumber—
—save 30% of the labor cost—
—reduces the skilled labor required—
—guarantees complete shipment of material—
—guarantees the quality—
—carries material for 1,000 houses in stock—
—ships from the nearest timber region—

—quotes definite prices on any order from one house up to a city of 3,000, including churches, schools, offices, water and sewage systems, electric plants, street and house lights, heating plants, street parks, trees, lawns, etc., complete.

Write, wire or phone for Aladdin catalog No. 207S

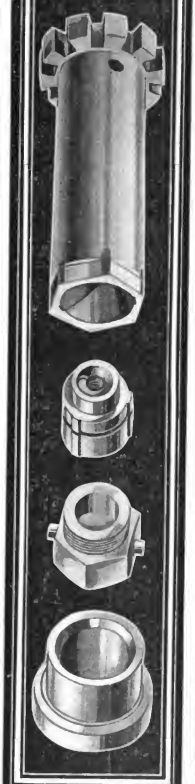
Still Curtailment

That's what is happening throughout the manufacturing world today! And that's what is likely to knock into a proverbial cocked hat the business prognostications of some of our so-called economists.

On January 11th, 1921, of the 47 blast furnaces in the Birmingham district 15 stacks were in blast (some of these likely to blow out soon), 9 furnaces are obsolete and 23 were reported idle.

This statement is not published for the purpose of urging you to buy heavily now and for a long time into the future. We don't believe that would be displaying good judgment.

We do earnestly desire, however, to impress upon the buying public the danger lurking in these wholesale curtailments because of the possibility of the natural law of supply and demand boosting prices to a ruinously high point.



As pig iron producers we much prefer an even, steady market productive of moderate profit over a continued period, to a condition which must, of its own weight, produce demoralizing fluctuations.

Buy now in moderation for a short period, not to exceed 90 days, and let's put a stop to further curtailment.

Why Automobile Craftsmanship Is Improved

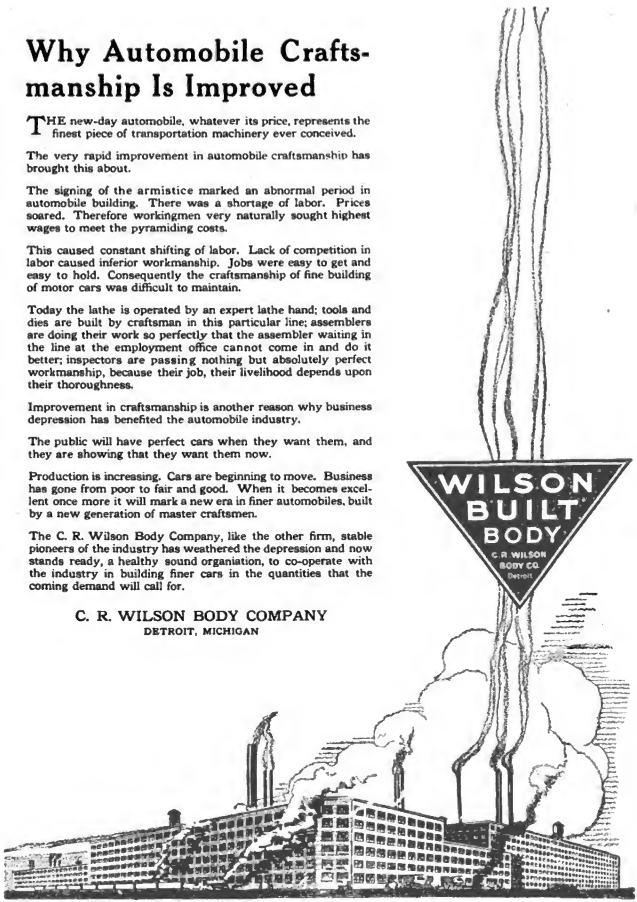
THE new-day automobile, whatever its price, represents the finest piece of transportation machinery ever conceived.

The very rapid improvement in automobile craftsmanship has brought this about.

The signing of the armistice marked an abnormal period in automobile building. There was a shortage of labor. Prices soared. Therefore workingmen very naturally sought highest wages to meet the pyramiding costs.

This caused constant shifting of labor. Lack of competition in labor caused inferior workmanship. Jobs were easy to get and easy to hold. Consequently the craftsmanship of fine building of motor cars was difficult to maintain.

Today the lathe is operated by an expert lathe hand; tools and dies are built by craftsman in this particular line; assemblers are doing their work so perfectly that the assembler waiting in the line at the employment office cannot come in and do it better; inspectors are passing nothing but absolutely perfect workmanship, because their job, their livelihood depends upon their thoroughness.



Improvement in craftsmanship is another reason why business depression has benefited the automobile industry.

The public will have perfect cars when they want them, and they are showing that they want them now.

Production is increasing. Cars are beginning to move. Business has gone from poor to fair and good. When it becomes excellent once more it will mark a new era in finer automobiles, built by a new generation of master craftsmen.

The C. R. Wilson Body Company, like the other firm, stable pioneers of the industry has weathered the depression and now stands ready, a healthy sound organiation, to co-operate with the industry in building finer cars in the quantities that the coming demand will call for.

AND
FINANCIAL RECORD

Farm Strike Myth, More or Less

Marketing of Grain, in North Dakota, at Least, Is Going On About the Same As in Other Years

IN VIEW of the somewhat unsettled conditions in the Northwest, which so far have resulted in the failure of more than 30 banks, the Michigan Manufacturer and Financial Record has sent its financial editor, Mr. Hanna, into that part of the country on a personal investigation. The accompanying article, written at Valley City, N. D., about 60 miles west of Fargo, is his first. He probably will discuss conditions further on his return to Detroit.

By PHIL S. HANNA

VALLEY CITY, N. D., January 30.—One of the big surprises encountered on this trip is the claim everywhere that there is less wheat remaining in the hands of the farmers that at the same time a year ago. The agent of the Northern Pacific at Sanborn, a town of 300 people, says that he is billing out two to four cars of wheat each day. The local bankers says that only the well-to-do farmers have been holding their crops and that many of these have contracts for future delivery. Thus the marketing of crops in this section seems to have gone ahead about the same as in former years and one begins to wonder whether the much discussed farmers' strike is responsible for all the business ills or not.

The Non-Partisan wave of "reform" apparently has about spent itself and the taxpayers stand to lose in the neighborhood of $5,000,000 by the experiment, not to mention other millions probably spent trying to find a cure for Townleyism. The co-operative packing plant at Fargo has run behind $700,000 and the original $700,000 put into start it off is also gone.

Still Savage

The increased freight rates have made a difference of 6 cents a bushel from this city to Minneapolis—the former rate was 11 cents and is now 17 cents. The average farmer is still in a savage frame of mind towards the middleman and the grain speculators. He feels that he was limited to $2.26 a bushel when demand would have brought him $3.50 or $4 during the war, and figure the loss of possible profits during that period when other business men were getting the limit as a fair reason why he should be given an artificial price now.

There has been a temporary lull in the closing of small banks in the western part of this state, but the outlook is not very promising, except for one factor. If the wealthy farmers, who are not borrowers, get the selling bug, the day will be saved. And there is a fair chance of this. An elevator man said yesterday that every time wheat goes down a cent, the farmers bring in a full load, but when it goes up, they quit coming. The writer talked to a physician who owns some 5,000 bushels of 1920 wheat and he said that by spring there wouldn't be more than enough for seed left in his county.

Outwardly the farmers look much more prosperous than they did in 1915 when the writer left here. New houses and barns are evident in every direction and the man who still drives a Ford is a second rater. Many of the boys who were renters five years ago are driving larger cars with all the abandon of a Detroit automobile worker when the latter was getting $10 for four hours' work spread out over eight hours on duty.

The man who has suffered here is the small banker, and in fact any banker who spread himself out during the last three or four years trying to get all the business is now wearing crepe.

Perhaps the telephone company has been one of the chief beneficiaries. For example, a man deposits a draft in A-ville drawn on the First National of Minneapolis by the Bank of B-ville. The cashier at A-ville is in doubt about the value of B-ville drafts, so he says to the depositor: "We will take this for collection, or if you want immediate credit we will phone Minneapolis at your expense." The depositor complains, but wants the money immediately, so he says: "Go ahead." Minneapolis replies that they will have to call up the B-ville bank and that they will phone back to A-ville shortly. After half an hour or so, Minneapolis phones back, that they cannot certify the draft by phone. Result, the A-ville bank takes the draft for collection, depositor waits and the telephone company does a flourishing business.

According to one banker who has been in the Northwest many years and who has weathered several financial storms, one of the principal contributing causes of bank closings in this section has been the ease with which a small bank has been able to get accommodations at the Minneapolis Federal Reserve Bank. In his opinion, many of the small banks, especially the national banks, obtained more credit at Minneapolis than was good for them. Instead of refusing their customers last spring, they called on Minneapolis and apparently the latter yielded. I saw a statement of a national bank, situated not more than a thousand miles from here, which disclosed that the borrowed money obligations were about twice the total deposits. And the surprising feature of this case is that three directors have undertaken to pull the bank out by pledging their personal fortunes. The scheme arrived at probably will provide that the bank will transfer without recourse enough assets to cover the liabilities assumed by the three directors.

It should not be hastily concluded that this is the general condition. On the other hand, there are two banks in this city whose credit and standing is so good that they have sold their excess lines in the East without recourse. But both were exceedingly busy last spring saying "NO," and saying it in on uncertain language.

A New Bank Official

I saw a letter-head of one solid little bank which has added a new kind of official to its staff. At first it struck me as funny, but upon inquiry I found that the official really confines himself to the duties his title describes, namely, "collector." He has a nice little closed Ford and carries a full line of note blanks, mortgages, etc., and is himself a notary public and a deputy sheriff.

A statement of condition just issued by the Bank of North Dakota, the state depositary, shows a reduction of $11,880,000 in assets since June 4, 1920. Profits for 1920 are given as $121,883.17, but as there is no paid-in capital, it is hard to figure out whether the enterprise is ahead or behind on the year's operations. The capital is indicated as $2,000,000 and surplus $40,000, but it will be recalled that the state issued its own bonds which were intended to be sold to provide capital. So far as I can ascertain, the bonds were not sold but the bank did obtain a loan of $1,000,000 from a Chicago bank, with $1,200,000 of the bonds as collateral, this loan being shown in the statement, which is appended, as bills payable. I understand all

Digitized by Google

state banks may deposit all or part of their reserves in the bank and all public funds must be deposited in the central institution, which turns around and redeposits funds in the state banks. It is said on good authority that the state bank had more than $900,000 deposited in the 32 banks which have been closed. A firm of public accountants is making an audit of the Bank of North Dakota and the anti-Non-Partisan claim is made that the audit will reveal wide discrepancies between the bank's own statement and the condition to be made public by the accountants. Conservative opinion seems to be that the state bank is solvent but that it represents a piece of very expensive foolishness.

The ground is frozen down more than two feet and the mild weather, which prevailed up to yesterday, has resulted in more fall plowing being done than for 25 years past. All signs point to early spring activity and the planting of large acreages. You hear a man explode loudly in one breath about restricting production and in the next he is telling about his large plans for spring planting.

There's one thing a farmer won't talk about, and that is his winnings. The attempted misconduct of the middleman, grain gambler or profiteer cannot keep the farmer from trying to make money, whether he is conscious of it or not.

The Bank of North Dakota statement, referred to above, is as follows:

ASSETS	
Bonds, United States, state and county	$ 1,962,756.25
Loans to banks	2,687,418.02
Loans on warehouse receipts	94,000.14

Total liabilities	$15,926,725.24

DETROITERS ADDRESS ENGINEERS

Three Detroiters spoke at the February meeting of the Detroit Chapter, Society of Industrial Engineers, Thursday evening at the Detroit Board of Commerce. The subject was factors in management for 1921. Chester M. Culver, general manager of the Employers' Association of Detroit, talked on "Labor"; Edgar R. Allen, treasurer of the Detroit Steel Products Company, on "Credits," and Elwood Brown, chairman of the public relations committee of the National Association of Purchasing Agents, discussed "Purchasing."

Mr. Cathro, managing director, disputes the reasons which have been assigned by eastern interests for the decline in grain prices. He said that the European situation had no part in declining prices.

"The average farm price was around $1.70 a bushel in November, 1919," he said, "while the average November 1920 price was probably not above $1. That is, the farmer received 70 cents a bushel less for wheat in 1920 than in 1919, and the European buyers paid 30 cents a bushel more than they did in 1919. The spread between the farm price and the export price was 61 cents a bushel in 1919 and $1.61 a bushel in 1920. The difference in railroad charges would not account for more than 20 cents."

Motor Car Exports and the Tariff

AUTOMOTIVE manufacturers throughout the country believe a reduction in the rate in the duty on motor cars selling for $2,000 or more and a provision for reciprocal relations as a national policy to be imperative as an immediate factor in restoring foreign trade in motor vehicles. The desire is for a uniform tariff of 30 per cent ad valorem.

In making this decision the manufacturers realize that such a reduction will be an favorable to foreign automotive manufacturers as to themselves, but the balance in horsepower and selling price between foreign and domestic vehicles is in favor of the American manufacturer, therefore he has no great fear of dangerous competition.

The National Automobile Chamber of Commerce has filed with the ways and means committee of the House of Representatives a brief bearing upon the subject of tariffs. Under Schedule C, paragraph 119, Tariff Act of 1913, the following duties are laid:

"Automobiles valued at $2,000 or more and automobile bodies, 45 per cent ad valorem; automobiles, automobile chassis and finished parts of automobiles, not including tires, 20 per cent ad valorem."

The National Automobile Chamber of Commerce would amend this paragraph to provide the 30 per cent tariff and a national policy of reciprocal relations, thus furnishing protection for American industries requiring it, producing revenue and preventing discrimination by foreign nations. It is explained in the brief that this opinion has to do with present conditions and does not prevent future advocacy of such changes in the tariff as may be called for by improvements in the national and world situation.

In maintaining that increased revenue will result from tariff revision, the brief says:

"The imports of high-priced cars during 1920 amounted to 6 per cent and those of lower-priced motor vehicles to 94 per cent of total automobile imports. According to numbers, there were 59 high priced and 654 low-priced cars. The revenue from the former was $99,305 anl $153,986 from the latter. The smaller number consisted of automobiles selling in country at origin at more than $2,000."

"The smaller imports of that type of vehicle may be due to the higher U. S. duty," the brief continues. "With a uniform duty of 30 per cent, however, the imports of higher priced cars will proportionately increase, and consequently result in higher revenue. Despite the fact that this measure may directly affect interests, American manufacturers of high-priced cars are adherents to this policy, believing that it will be of general benefit to the industry.

"Because of large scale production and consequently minute division of labor, American manufacturers are making automobiles which embody the highest value for every dollar of cost. This point is brought out more clearly in the following table:

Name of Vehicle—Nationality	Horse-Power	Price at Current Rate of Exchange	Horse-Power	Difference Favoring American Cars Price
*Daimler (chassis), German	43.2	$3,300		
*Lanchester (chassis), English	40	7,700	3.2	$2,400
*King (touring), American	28	4,462		1,862
*De Dion (touring), French	25	6,335	3	1,873
Marmon (touring), American	35	6,000		
*Maxwell (touring), English	35	5,867		867
*Peerless (chassis), American	33.8	4,060		
*Minerva (chassis), Belgian	30	1,147	3.8	83
*Chevrolet (touring), American	24.75	1,575		
*Citroen (touring), French	10	1,725	11.75	157
*Maxwell (touring), American	21.03	1,870		
*Chiribiri (touring), Italian	16	2,437	5.03	612

*Prices in England
†Prices in United States

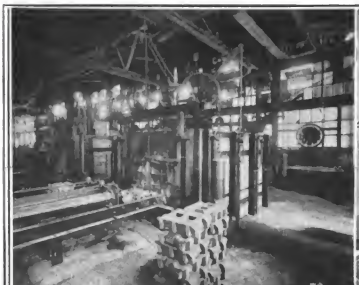
This table shows that the American motor car manufacturer can readily compete in the foreign market. Then there is the fact that the automotive industry in this country ranks second in size. It employs 200,000 persons, or 48,000 more than the United States Steel Corporation. In the United States there are approximately 8,000,000 cars in use, 90 per cent of all those in use in the world, which indicates the extent of the foreign market and the limitations in the United States, for it has been said that where there are 12,000,000 cars in use in this country it will be time to curtail motor car production so far as domestic consumption is concerned.

Relative to change on one hand and foreign resentment on the other, the brief says:

"During 1920 the exports of American motor vehicles to all countries, including non-contiguous U. S. territories, amounted closely to 180,000 in number and approximately $200,000,000 in value. All possible efforts should be made to stimulate foreign trade so as to enable American manufacturers to find markets for increasing number of cars abroad, thus tending to stabilize the industry.

"At present time, the export trade is considerably hampered by great depreciation in the foreign exchanges. To afford manufacturers in countries with depreciated currency opportunity to sell their products in the United States will tend to right this condition. Although it is fully realized that the increased imports of automobiles, even if the duty on high-priced cars is reduced, will not be such as materially to improve the exchanges, still even minor influences of this kind if multiplied in other trades that will not be greatly affected thereby are certain to bring about improvement in international finances.

"Besides the depreciation of money exchanges, the greatest obstacle confronting American exporters of automobiles is the tariff wall being built up abroad in retaliation because of the high duty on foreign automobiles imported into the U. S. Resenting the American duty of 45 per cent on high-priced cars, foreign interests in Great Britain have already urged the assessment of duty higher than 33 1-3 per cent on all kinds of motor vehicles, whereas up to now that duty is applied to passenger cars only. France has already imposed a duty of 45 per cent on the kind of automobiles exported by American firms; an action which is directly traceable to the belief that the U. S. automobile duty is discriminating against high-priced cars of French manufacture. Similar action has also been taken by Italy and Belgium; Spain is about to follow.



"That favorable results from a uniform U. S. duty may be expected is shown in the action of the French automobile manufacturers, who informed their government that the English, Belgian, Italian and French syndicates had

Successor to the Village Smithy

Modern Forge Shop, Largely Developed in Michigan, Does Work That Would Make Forbear Stand Aghast

DROP FORGE PRODUCTION

Above at the left is shown a die-hardening furnace in the plant of the Studebaker Corporation, Detroit. In this furnace the dies are heated to 1,500 degrees, F., and then dipped in oil to harden them. The photograph at the right, above, shows how a crankshaft is forged. Note the shape of the crankshaft cut into the dies.

At the left (lower picture) is shown a 12,000-pound drop hammer in the Central Forge Company's plant, Detroit. This hammer strikes a 6-ton blow. At the right is a 7,000-pound hammer in the Timken Axle Company's factory in Detroit.

By HOWARD CAMPBELL

THE VILLAGE BLACKSMITH, who labored long hours to produce a set of iron shoes for a horse, probably would stand speechless in amazement were he to happen into a modern forge shop and see crankshafts, connecting rods, wheel hubs and even heavy truck axles produced "while he waited," by machines which tower higher than the spreading chestnut tree.

Just as the ancient mare has been largely replaced by the modern automobile, so the blacksmith's hammer has been superseded by the modern drop hammer, which, with the aid of steam, strikes a blow of such force as to make the surrounding earth tremble.

The first steam hammer was built in the Schneider & Company steel works, at Creuzot, France, in 1841, although the credit for the invention generally is awarded to an Englishman, Nasmyth by name, who was engaged in the business of building machinery.

The idea of making dies was a natural sequence of the use of the steam hammer, and the first drop forgings were made about 1860 at Birmingham, England, since which date this method of making steel parts has developed until today there probably are more parts produced in this manner than by any other. The truth of this statement is evidenced by the fact that proximately 150 different parts in the construction of an automobile are made from drop-forged steel.

In the old days the quality of the piece depended, insofar as size and shape were concerned, on the blacksmith. With the drop hammer, forgings can not only be made quicker but in greater variety; and forgings that were most difficult or even impossible over the anvil are made with apparent ease. There seems to be no limit to design, and the best feature of all is that all pieces produced are absolutely accurate and alike to the smallest detail.

The first steam hammers used in Michigan were set up in the plant of what was then the Wyandotte Rolling Mills, at Wyandotte, where they were used in the manufacture of boiler plates. Incidentally, these boiler plates were made from charcoal iron, and the assertion recently was made by a man who has spent a lifetime in the machinery business that these plates were the best ever produced. However, the development of steelmaking on a big scale put the Wyandotte Rolling Mills out of business many years ago. The Timken-Detroit Axle Company is said to have built the first drop forge plant in the state, which was for the manufacture of parts necessary to the manufacture of axles.

The ever-increasing demand for better and stronger machinery, including the automobile, has developed a need for parts of the clean, workable steel which is characteristic of the drop forging. Besides being free from sand, sand holes and blowholes, which are found more or less in steel castings, the steel is of even quality and can be machined at a much higher rate of speed than castings. Consequently many of the larger automobile and machinery-building plants have their own drop forging departments and the smaller establishments are supplied by independent drop forging concerns. It is estimated that 5,000 men are employed in the forge shops of Michigan, operating somewhere in the neighborhood of 400 hammers. These men draw an aggregate wage of approximately $52,000 a day, or $15,600,000 a year.

The production of a drop forging requires a set of two square steel "die blocks," half the

Digitized by Google

thickness of the piece desired being cut or carved into the face of one block, and half into the other. One die block is securely fastened to the base or anvil of the machine, the other half being fastened to a ram which travels vertically between guides. The ram is fastened to a piston rod which slides smoothly in and out of a vertical cylinder at the top of the machine. The bars of steel from which the forgings are to be made are heated in a furnace until they are nearly white hot. The operator of the hammer then pulls a bar out of the fire, lays the end of it on the lower half of the die, steps on a lever which lets a charge of steam into the cylinder above, and the ram shoots down, striking the steel a blow which forces it into the recesses in the die block and forming it instantly to the desired shape.

In order better to withstand the punishment which they have been put to, the dies are hardened by heating them to a dull red and then melting as much cyanide of potassium on the surface of the blocks as they will absorb, or by hardening in oil. The cyanide process has been the one most used, and is still used for dies which do not have to be replaced often. Cyanide hardens the surface of the block for a depth only of from six to ten thousandths of an inch, however, and this method is being discarded for processes which harden the block to a much greater depth.

The latest and most improved method is to heat the die blocks to about 1500 degrees F., in a furnace where they will be heated evenly on all sides, then dip them in oil or water. Oil is better than water because it takes the heat off more slowly and reduces the risk of cracking the die. This treatment makes the steel hard and brittle—about as brittle to use as it has to be heated again to approximately 700 degrees, which is just enough to relieve the strains which were set up in the hardening process and impart a quality of toughness to the steel.

The machines vary in size according to the work for which they are required, and the capacity of a machine is known by the force of the blow it delivers. Thus a hammer which strikes a blow equal to 7,000 pounds is known as a 7,000-pound hammer, one striking a 12,000-pound blow is known as a 12,000-pound hammer, and so on. Drop forged steel axles and crankshafts are made on the larger hammers, and smaller parts, such as connecting rods, axle shafts, steering knuckles, gears and similar parts are made on hammers ranging down to the 800-pound size.

In order to be sure of having enough stock to produce the forging, an extra amount is allowed in the bar. Consequently, when the ram comes down and the two die blocks come together with the steel between them, a certain amount of steel is forced out into a sort of "fin" around the forging. This is called the "flash" and is removed by forcing the forging through a trimmer die which is just the shape of the piece and of the correct size. Large pieces are trimmed while hot, but the smaller ones usually are sent to a trimmer press room, where they are trimmed cold.

Central Forge Company's Equipment

One of the largest forge shops in Michigan is that of the Central Forge Company, Detroit, which makes the forgings for most of the General Motors Corporation plants. The equipment consists of 41 steam hammers, 19 "board" hammers, 8 horizontal forging machines and 3 bull-dozers, or upsetting machines. Five hydraulic straightening presses are also used to straighten camshafts and other shafts and rods which may have warped in cooling off. Two of the hammers are of the 12,000-pound size, the only other hammer of this size in the state being located at the Buick Motor Company's plant, in Flint. A machine of this capacity is approximately 8 feet wide and 25 feet high, and weighs between 85 and 90 tons. Undoubtedly the force of the hammer would drive the machine itself into the ground were it not for the fact that the machine has an iron base extending about 6 feet into the ground, where it rests on a concrete foundation from 11 to 15 feet deep. The steam pressure in a 12,000-pound hammer is about 90 pounds to the square inch.

These big machines are used to forge crankshafts for automobiles, trucks and tractors, shaping a crankshaft from a bar of steel with two or three blows. Two men are required to operate the hammer, one holding the work (with the aid of an auxiliary crane) while the other operates the levers which control the hammer. A bar of steel of the size required to make a crankshaft for a Samson tractor weighs 65 pounds, obviously too heavy and awkward for one man to handle alone. Axles are made on the 6,000-pound hammers, camshafts and small crankshafts on the 3,500-pound machines. The smaller work is graduated to the machine accordingly. The pipes which carry the steam to the hammers are all overhead, where they can be easily reached by the repair men. Electric trucks are used to transport stock to and from the machines, and a 10-ton electric crane is always at hand to carry dies and machine repair parts.

Furnaces Burn Crude Oil

The furnaces in which the bars of steel are heated for forging burn crude oil and are arranged so that one furnace heats the steel for two hammers. The supply of oil is kept in tanks, each having a capacity of 20,000 gallons. There are 14 tanks, the aggregate capacity amounting to 280,000 gallons. Under normal conditions, however, the plant uses 18,000 gallons a day.

The die-sinking equipment of the Central Forge plant includes four die-sinking machines which perform mechanically the operations of machining a die, in a manner which is almost uncanny. These four machines are used to machine all dies up to and including 10 inches high by 12 inches square, using one machine for machining the top half of the die and another for the bottom half. Thus a set of dies is completely finished before they are taken from the machine. The die blocks are planed, of course, before placing in the machine, but no part of the impression is "sunk" by hand.

It Runs, That's the Point

BRIGHT new motor car models with streamline bodies, six, eight and 12-cylinder motors, sedan, coupe, landaulet, brougham and cabriolet bodies, self-starters, electric lighting systems, gas-saving carburetors, tire pumps, cigar lighters, bouquet vases and all the rest of the jim-cracks hold no charms for George Holden, of Olivet.

George chug-chugs through the streets of his native town serene and wholly satisfied in his one-cylinder Cadillac, which he has driven 17 years. It was the second car the Cadillac Motor Car Company built, and George has it. It may not purr like the present-day Cadillac, but it runs, and George doesn't mind a little noise.

He has just obtained his usual license, for which he paid $7.05, the lowest fee paid in the state of Michigan.

One man operates the four machines. Up to the time die-sinking machines were invented, a large part of the work of die-sinking was hand work, requiring the services of highly-trained mechanics. The advent of die-sinking machinery not only made possible greater production, but the grade of help used in the operation of these machines can more easily be replaced.

The Central Forge Company's plant is of the most modern type for this phase of manufacturing, and consists of two buildings each 600 feet long, in which the entire machine equipment is housed. At one side of the plant and extending the full length of the buildings is the steel yard, or stock of raw material, each size being piled separately. A series of concrete foundations serve to keep the steel even and off the ground. An average of 20,000,000 pounds of steel is carried in stock, worth approximately $490,000.

At equal distance from each other along the side of the forge shop nearest the steel yard are three shear sheds, where the stock is cut into required lengths for forging. The shearing equipment consists of two shears and one "alligator," which will sever a bar of 3¼-inch square steel with the same ease of a pair of scissors cutting a piece of cloth. The steel stock is carried to the machines by either one of two overhead electric cranes, each of which carries five tons at a load. As the steel is cut to the required length, it is passed to the forge shop and distributed to the machines, and as fast as it is made into forgings these are passed on to the next building, where they are inspected. A battery of five hydraulic presses is used to straighten such pieces as are bent or warped, and then they are sent to the annealing floor.

When production is normal this plant turns out approximately 2,500 crankshafts, 2,500 camshafts and 8,000 connecting rods a day, the aggregate weight of which is in the neighborhood of 4,263,000 pounds. This production requires a force of 800 men, whose wages and salaries amount to $8,500 a day, or more than $260,000 a month. Eighty-seven of these men are kept busy repairing the old dies and making new ones, and a force of 25 men is required to keep the machines in first-class working condition.

Other Installations

The Timken-Detroit Axle Company, with whose product every automobile fan is familiar, has two giant 7,000-pound hammers which it uses for forging front axles of the larger size, these axles weighing 180 pounds each. One hammer is used for "roughing out" the piece, the other for giving it the final shaping, or "finish." Practically as many axles are produced by this method as by finishing a piece complete on each hammer, and the dies last much longer. One hundred and sixty finished axles are made in eight hours on these two hammers. Smaller axles are made on a battery of eight 5,000-pound hammers, a number of smaller machines bringing the total up to 30, which make all the drop forged steel parts used in Timken axles. A trimmer press is provided for each hammer, so that as the forgings are made they can be trimmed immediately and thus be ready for production.

The furnaces in which the steel is heated are made of steel and lined with fire brick. Crude oil is used for fuel, from 8,000 to 10,000 gallons being used daily. A 40-ton electric crane is always at hand to carry stock, dies and repair parts for the machines.

Another large drop forge plant is that of the Studebaker Corporation, in Detroit. Equipment includes 35 drop hammers ranging in size from 500 to 7,000 pounds. There are three of the 7,000-pound hammers, all of which are used for making front axles and crankshafts. The production of a crankshaft requires a bar of steel 2¾ inches square and 51 inches long, weighing 110 pounds. The power of modern

Michigan Utilities Form Information Committee

Michigan's gas and electric companies have organized a committee and established headquarters in Ann Arbor for disseminating information covering every phase of the business of producing and distributing light, heat and power. It will be known as the Michigan Committee on Public Utility Information.

The committee explains that it is divorced from all political and legislative interests and will have no part in controversial matters whether local or state-wide in scope. It will be financed through the Michigan Gas Association and Michigan Electric Light Association. Henry Douglas, head of the Washtenaw Gas Company, who serves as chairman, says that the plan is predicated upon the theory that the success of the gas and electric business requires only that the public shall have an intelligent understanding of the facts concerning these industries.

Henry H. Tinkham, who has been with the Grand Rapids Press 20 years, has been named director of the committee. The committee will serve the industry at large rather than any individual company. Anyone seeking information, either for or against the gas and electric companies may turn to this committee with confidence that all the facts speedily will be forthcoming and without qualification or reservation.

PITTSBURG SHAFTING CHANGE

The Pittsburg Shafting Company, of Detroit, which for some years has been closely affiliated with the Columbia Steel & Shafting Company, Pittsburgh, Pa., has been purchased by the latter concern for economical reasons as well as promote greater efficiency and better service. Effective February 1, the Pittsburg Shafting Company is being conducted as a branch of the Columbia.

There will be no change in the business policy or personnel of the administration under the new name. W. C. Schrage, president of Pittsburg Shafting, will be associated with the Columbia as treasurer, with headquarters in Pittsburgh, while Thomas H. Booth, vice-president of Pittsburg Shafting, becomes district manager of sales in Detroit.

All accounts and obligations due the Pittsburg Shafting Company will become payable to the Columbia Steel & Shafting Company on and after February 1.

ROSEVILLE GOLF CLUB FORMED

John F. Keys, general passenger agent of the Detroit United Railways, and Paul R. Gray, moving spirits in the organization of the Roseville Heights Golf Club, have set the opening of the club for June 15, at which time the 9 and 18-hole courses will have been laid out and the clubhouse ready for use. The club has 137 acres located about 13½ miles from Detroit's business center. Ernest Way, who laid out the Detroit Golf Club, the Burch Hill, the Island and other golf courses, will design and build the Roseville courses. The club is practically a public affair, there being no initiation fee, but dues of $60 a year, or $65 on time payments. If desired a bus line will be established from the Rapid Railway line to the links, running on a half-hour schedule. Ernest I. Kennedy, 576 Griswold street, Detroit, is the club's secretary.

SLEEPER ENTERS GENERAL PRACTICE

Harold A. Sleeper, formerly general attorney for the Pere Marquette Railway Company, announces that he will be engaged in the general practice of law at 1560 Penobscot building, Detroit. Special attention will be given to practice before the interstate Commerce and Michigan Public Utilities Commissions.

How Industry Is "Coming Back"

A Summary of a Week's Progress in Resumption Of Various Manufacturing Activities in Michigan

ALTHOUGH the resumption of industrial activity throughout the state during the last week has been moderate, it has been sufficient to indicate that the peak of the depression period has been reached and passed, and that there is taking place a gradual restoration of confidence throughout the industrial centers.

In Michigan the Ford Motor Company and its varied interests are regarded as important barometers of the business and industrial future, so that the resumption of activity in the huge Highland Park plant is recognized as the messenger of good tidings.

The Ford plant opened Monday with a reported force of 10,000 men at work, all summoned by postcard. It has been said that this number of men is the minimum at which production is possible in this plant, but on the other hand, it is stated that the men at work are not on car production, but on overhauling, preparatory to manufacture.

The very fact that the Ford organization goes to the expense of getting the plant into shape for future production, in view of the recent reports regarding Ford finances, is bound to be assuring. Judging from the stream of reported resignations from the official family of the company, not only must the concern prepare its physical properties for a return to production, but the administration staff must be augmented and reorganized.

The resignation of S. S. Marquis, director of the Ford sociological department, upon which Mr. Ford placed great store, gives rise to the question of whether this sociological work is to be continued. The general tendency of industry during its period of rehabilitation will be to give all attention to production and sales problems, leaving such factors as welfare to the future.

Another resignation, and one connected with the important division of sales, is that of Warren C. Anderson, general foreign representative of the company. Inasmuch as export business will have a greater significance in connection with the restoration of automotive production, the disruption of foreign sales organization does not improve the situation. The report that Louis Block, Philadelphia distributor, has vacated his Ford connections simply recalls Ford's unfortunate attack upon the Jewish race.

While Michigan's newspapers and periodicals, anxious and willing to keep the public informed and encouraged during this difficult period, are striving to gain information from the Ford interests, all channels of direct official importance are closed by the red tape and reticence that long have been the methods of concealment practiced by Ford's advisors.

As a result, all that the apparent resumption of activities in the Ford plants indicates is that Mr. Ford has the necessary cash and re-opened his plant with the minimum of workers, which has caused other establishments, particularly those furnishing supplies, materials and parts to him, to reopen.

One of these is that of the Briggs Manufacturing Company, Detroit, which makes bodies for Ford. This plant called back 1,250 men. Another is that of the Kelsey Wheel Company, which will operate at 25 per cent of normal. A part of this company's business is manufacturing wheels and rims for Ford cars. Mr. Kelsey's reported statement that his permanent force, when re-assembled, would not exceed 2,400 men, as against 3,300 previously employed, indicates that greater production with fewer men is expected.

Other signs of industrial activities forthcoming during the week may be summarized as follows:

The plant of the Cadillac Motor Car Company reopened with 2,500 men at work, and with the prospect of increasing this force gradually.

Walter P. Chrysler's report that the reorganizing and financing of the Maxwell-Chalmers Corporation had been completed, had additional capital of $15,000,000 and would develop sales and production on a larger scale, is not without its important significance.

Units of the Motor Wheel Corporation, Lansing, are at work on a part time schedule, the Auto Wheel, Gier Pressed Steel and Prudden Wheel plants being affected.

The high peak of optimism was reached by the Briscoe Motor Corporation, Jackson, when it reported that its 1921 schedule would call for 18,000 cars, or three times the 1920 volume. Affected by this promise are the Briscoe Body, Auto Body, Barker-Fowler Company, maker of electrical harness, and John Bohnet & Company, closed body builder.

The report that the Oldsmobile plant in Lansing had shipped 60 cars to the Chicago distributor indicates that there is sales life in evidence.

An order for 250,000 piston rings received by the No-Leak-Piston Ring Company, Muskegon, is reported.

Straying from the automotive field for a moment, we are encouraged by the fact that the foundry of the Novo Engine Company, Lansing, builder of gas engines, pumping and hoisting machinery, is working on full time.

In the realm of materials, the reopening of the Trumhull Steel Company's sheet and open hearth departments, at Warren, Ohio, on a 65 per cent schedule with a full force bespeaks confidence.

Battle Creek has witnessed with considerable pleasure the reopening of the cereal factories, although as yet only 50 per cent of the working forces have been employed.

In Kalamazoo the paper industry keeps humming on a 24-hour schedule, with three shifts.

Returning to the automotive business, the report that the Reo Motor Car Company, Lansing, has put between 5,000 and 6,000 workers on a six-hour, instead of a half-day schedule, restores confidence in that city.

The Monarch Specialties Company, Muskegon, reports orders just received, while the foundries in that city are receiving orders for railroad equipment.

From Ann Arbor comes the report that the manufacturing activities of the Paige-Detroit Motor Car Company, Detroit, have been delayed by the threatened resumption by the loss of certain patterns, claimed to have been in the possession of the Ann Arbor Metal Products Company. The case has been taken to court and Judge George W. Sample has been asked to decide upon the enforcement of a writ of replevin intended to recover the patterns.

The Acme Motor Truck Company, Cadillac, announces it will start production March 1.

CANN GOES TO TOLEDO

W. E. Cann, who has been assistant to the general manager of the Detroit United Railway, became street railway commissioner of Toledo, O., February 1, taking up his duties simultaneously with the inauguration of the service-at-cost plan in the operation of the city car lines. Fares are to be cut to 6 cents, with one cent for transfers.

Government Reorganization Task Before Legislature

The reorganization of the administrative government of Michigan, as proposed by Gov. Groesbeck, is among the most important matters awaiting action by the Legislature. The bills proposed to centralize the state government would abolish a number of departments, boards and commissions. Departments of agriculture and conservation, with a commissioner at the head of each, would be created, and these would combine 17 present departments. Another bill would abolish the state labor department, and industrial relations commission and create an industrial and labor department under the direction of a commission of three.

Several bills were introduced last week which would affect business, industry or finance. Rep. David H. Butler, Lapeer, proposed the repeal of an act passed by the 1919 legislature which provides that an employer who advances transportation to a laborer in a distant city and is not reimbursed may prefer criminal charges. Mr. Butler charges that this is in violation of the principle that no man may be arrested for the non-payment of a debt, and contends that the employer should recover his money through civil channels.

A bill of Rep. Hunter, St. Johns, would permit state banks to invest half of their capital and surplus in buildings. The present limitation is half the capital.

Senator Harvey A. Penney, Saginaw, has introduced a measure which provides that cities may assume a bonded indebtedness up to 5 per cent of their assessed valuation. Some cities now are restricted to 2 per cent, although others have gone as high as 5. The bill providing for the Colgrove highway was also introduced by Senator Penney.

A bill of Rep. Warner would limit the amounts which can be levied against land for highway purposes to 10 per cent of the assessed valuation. It also provides that 3 per cent of the assessed vaination is the limit which can be levied in any single county in one year.

The total budget estimates of the state for the next two years reach the sum of $72,504,103.11, or more than double the total for the present two-year period, and still the appropriation measures are pouring in for the various institutions.

U. OF M. READY TO AID PLANTS

Director A. E. White, department of engineering research, University of Michigan, has notified manufacturers of the state that the department is prepared to furnish originals or copies of technical works in the University library, the original books or papers to be lent for two weeks with extension privileges.

JACQUET DEFERS MOTOR PRODUCTION

The Jacquet Motor Corporation, Belding, is reported to have started last week the production of generators for the B. J. Steam Gas Generator Company, Grand Rapids. For the time being, it is said in Belding, the Jacquet concern will not make motor cars. Later, when the situation in the automobile industry is again normal, the company expects to produce the Jacquet cars, for which purpose it was originally organized.

COUPLE-GEAR WHEEL ELECTION

At the annual meeting of the Couple-Gear Freight Wheel Company, Grand Rapids, the stockholders elected the following directors: M. C. Church, A. B. Knowlson, N. H. Hopkins, Alexander Dodds, Fred Z. Pantlind, L. Z. Hudson, W. C. Hopson and James Leenhouts. Officers will be elected at a subsequent meeting of the directors.

They Buy Baby Carriages, Business or No Business

In all industries there are to be found optimists, no matter what the conditions. Even if an adverse business situation affects them more or less, they continue to have faith in tomorrow, and operate accordingly. The Lloyd Manufacturing Company, Menominee, is one of these. George W. Rowell, advertising manager of the company, writes the Manufacturer:

"I am glad to report to you that while all other American baby carriage factories are closed, we are still running with a full force. It is true that our shipments have been far below normal during the last three months, but we have continued manufacturing so as to get a good stock ahead before the contemplated spring rush.

"We are certain that 1921 is going to be a good year for us. Our business is one which depends upon nature. When nature sees to it that a great crop of human beings comes into the world, then we have an increased business. Such has been the case during 1920. The birth rate is far greater than ever before. Baby carriages are not bought during either fall or winter months because people do not take their babies out-of-doors in the winter time. When spring comes, people rush for the baby carriages, and since there are more babies than ever we look for a greater sale of baby carriages.

"You may counteract my argument by saying that people will not buy baby carriages when they are not earning big wages. My reply, based on investigation, proves that mothers and fathers will undergo great sacrifices in order to buy a baby carriage. For this reason we still insist that we are in store for a good business."

GRANDS RAPIDS' SHOW

The annual Grand Rapids automobile show will be held February 21 to 25 in the Kingman exhibition building. Practically all of the local dealers are reported to have obtained space. The cars to be on the floor include the following: Packard, Marmon, Lexington, Nash, Studebaker, Cadillac, Dort, GMC truck, Paige, Oakland, Overland, Willys-Knight, Crow-Elkhart, Auburn, Tower truck, Pierce-Arrow, Franklin, Oldsmobile, Ford, Scripps-Booth, Dodge, Jumbo truck, Chalmers, Maxwell, Moon, Cole, Cleveland, Chandler, Elcar, Kissel, Jackson, Hudson, Essex, Winton, Elgin, Monroe, Hupmobile, Case, Nash truck, United truck, Liberty and Indiana truck. A number of accessory and parts manufacturers, as well as half a dozen accessory dealers, have also contracted for exhibits.

BRISCOE'S 1921 SCHEDULE

Eighteen thousand cars will be made in 1921 by the Briscoe Motor Corporation, Jackson. The 1920 production was 6,000 cars. By March 1, a full force will be employed in the Briscoe plant. The factory has never fallen below a production of ten cars a day at any time during the depression, and today 35 cars a day are being turned out. Seven hundred men are employed.

The Jackson Motor Shaft Company, a subsidiary of the Briscoe, is expected to resume operations gradually until a full force of men will be at work by April. This is also true of the Briscoe corporation's other plant in Lansing, the John Bohnet Body Works.

THRONE JOINS REPUBLIC TRUCK

The appointment of Daniel G. Throne as national sales representative of the Republic Motor Truck Company, Alma, has been announced by the company. Mr. Throne comes from the Diamond T Motor Car Company, Chicago, where for the last year he was district manager and where he was associated with A. J. Whipple, then general sales manager of this company, and who since has also joined the Republic organization. Mr. Thorne is well known in various industries by reason of his success with such lines as fabricated steel, hardware and motor truck equipment.

J. A. PALMER JOINS NEVILLE

J. A. Palmer has become sales manager for the Neville More Room Steering Wheel Company, Wayne. Mr. Palmer goes to Neville from the Burroughs Adding Machine Company, where he was for three years. Previous to that he was with the Good Health Publishing Company, Battle Creek. Mr. Palmer will have charge of both sales and advertising in his new connection.

R. C. DURANT QUOTED

R. C. Durant, son of William C. Durant, is quoted as saying that his father will build a light four-cylinder car selling for less than $1,000, also six and eight-cylinder models when Durant Motors, Inc., is ready for production. It is believed the Pacific coast plant of the corporation will be located in Oakland, Cal.

NEW BLOCK SHOWROOMS OPENED

The new home of the W. D. Block Motor Car Company, 6940 Cass avenue, Detroit, was formally opened last week and new models of Marmon and Lexington cars exhibited to the public.

MURFEY JOINS STANDARD TRUCK

W. A. Murfey, sales manager of the King Trailer Company, Ann Arbor, has resigned to become promotion manager of the Standard Motor Truck Company, Detroit.

HUPP'S 1920 OUTPUT

The Hupp Motor Car Corporation, Detroit, made 19,225 Hupmobile cars during 1920, as compared with 17,442 in 1919. Officials say that general conditions are improving steadily.

ACME TRUCK SHOWS A PROFIT

Directors of the Acme Motor Truck Company, Cadillac have re-elected the officers, who are; W. A. Kysor, president; John P. Wilcox, vice-president; C. J. Heim, secretary, and Henry Knowiton, treasurer. In addition to these officials the board of directors includes Henry Ballon, D. B. McMullen, G. F. Williams, F. O. Gaffney and Frank Bowen.

In addition to announcing that the year ended with a good profit, President Kysor stated that the Acme operated practically on a normal basis all year, beginning to show up only during the last quarter. While October was the least favorable of the last three months, December showed a decided improvement over November, which month was better than October.

It was decided by the stockholders to sell the remaining 3,700 shares of common stock.

STATEMENT FROM McCORD

In a statement as to the reasons why the regular quarterly dividend of the McCord Manufacturing Company, Detroit, has not been declared at this time, President McCord says, according to the Wall Street Journal:

"Sales in 1920 were $15,257,672 and net earnings before federal taxes, but after inventory adjustments, above $902,000. The great bulk of our inventory stands as solid material, therefore writing down will be very small, but we have to carry a large volume of open accounts. General expectation seems to be for 75 per cent of last year's automobile production this year. We fett no shrinkage in our business until September and operated two-thirds in November, but only 40 per cent in December."

SHERIDAN'S PROGRESS

President S. Burke, of the Sheridan Motor Car Company, Muncie, Ind., a General Motors unit, stated a few days ago that while the closed car models of the Sheridan four and eight were not quite ready, the light-finder models were expected to be out this month. The company has been strengthening its dealer organization and the demand for cars is keeping well ahead of the possible production for some time to come. More than 2,000 vehicles have been ordered by dealers voluntarily thus far, Mr. Burke says.

BEMENT ON AUTO BODY BOARD

Clarence E. Bement, manager of the Novo Engine Company, was elected to the board of directors of the Auto Body Company at the annual meeting. Other directors who were re-elected are Frank N. Arbaugh, W. V. C. Jackson, Harris E. Thomas, E. S. Porter, Fred C. Ruch, Richard Price, John W. Haarer, J. Edward Roe and Arthur C. Siebbins. Officers were not named. The reports showed that the company had $2,000,000 of unfilled orders on its books. The plant has resumed production on a restricted scale.

TRACTOR SHOW IN COLUMBUS

The sixth national tractor show will be held in Columbus, O., February 7 to 12, at the Ohio State Fair grounds, where seven buildings and the Coliseum have been opened for the exhibits. The educational program has been arranged by 20 universities and the American Society of Agricultural Engineers. Motor trucks also will be exhibited.

REY WHEEL ADDS DIRECTORS

New directors elected by the Rey Wheel Company, Detroit, to enlarge the present board are as follows: James C. Kempton, Detroit Sales Company; William Roberts, Roberts Tube Works, and C. R. Aikman, Amherstburg, Ont.

PURCHASING AGENTS ELECTION

A. G. Schroeder, of the Grand Rapids Gas Light Company, has been elected president, and A. J. Mitchell, of the Grand Rapids Refrigerator Company, secretary of the Purchasing Agents' Association of Western Michigan.

"SERVICE"

Manufacturers of the Six-Spindle Automatic Screw Machine

IN the purchase of Screw Products service runs a close second to quality in making satisfaction complete. It may not involve extra cost, but the lack of it certainly does—by disorganizing your schedules from assembling room to shipping department. "New Britain" Service is backed by an ability to properly tool the work, born of long experience in tooling Six-Spindle Automatics for the trade; a well-rounded and rapidly expanding equipment for handling a wide range of bar work; a stock of several million pounds of materials to insure against interruptions, and a complete organization to plan, schedule and see that promises are lived up to.

If this character of service appeals to you, phone our Detroit representative to get in touch with you.

TRANSPORTATION NEWS

Rail :: Commercial Hauling :: Water

Washington—In the case of the Chevrolet Motor Company of California vs. the director general of railroads, as agent, the Chicago, Rock Island & Pacific Railway Company et al., the Interstate Commerce Commission has found that the Class A rates on auto body wood-work, knocked down, in carloads, from St. Louis, Mo., and Ionia, Mich., to Oakland, Calif., were and are unreasonable to the extent that they exceeded or exceed the Class B rates. Reparation is awarded. The case, which is No. 11210 on the Commission's docket, was submitted November 22, 1920, and decided December 31, 1920. The decision has just been published.

Detroit—The Pere Marquette Railway board of adjustment, which is created in compliance with the provision of the Transportation Act of 1920, met for organization purposes in the office of General Superintendent E. E. Cain, January 22. The representatives of the company are D. A. Klumph, examiner of rules, Grand Rapids, chairman; W. F. Crowder, assistant general car inspector, Detroit and J. H. Jordan, operating accountant. The circular issued by President Frank H. Alfred defining the duties of the board states that it will have jurisdiction in all disputes involving grievances, rules and working conditions which are provided for in the act and which it has not been possible to decide through a conference between the employe or his representative and an officer or representative of the railway. Disputes with reference to wages or salaries do not come under the purview of this board, as the act provides for these being heard by the Railroad Labor Board.

Port Huron—The formation of a steamship company to operate boats on Lake Huron on the line to Mackinac Island vacated by the Detroit & Cleveland Navigation Company, is under way.

Detroit—The White Star Line will shorten its summer schedule between Detroit and Toledo, opening the season between April 15 and May 1 instead of in March, and closing in September instead of October. The stringent requirements of the Seaman's Law are given as the reason. Like the D. & C. and the Ashley-Dustin interests, the White Star officials declare the law reduces earnings and makes steamship operation on lakes and rivers unprofitable.

Washington—P. H. Alfred, president of the Pere Marquette Railway, appearing at the hearings before the Interstate Commerce Commission on division of freight rates between railroads east and west of the Hudson river, said that Michigan railroads could not afford to give the New England roads part of their revenue. He said high coal prices had been the cause of the plight of the New England roads and Michigan roads had suffered from the same condition. Mr. Alfred criticised the action of the Railroad Administration in leaving railroads with contracts with 16 classes of labor, which contracts made wage scales on branch lines as high as on main lines.

Harbor Beach—The Board of Trade will renew its efforts to have the La Follette Seaman's Act provisions modified by the national legislature so that lake and river navigation will not be interrupted. The business interests here are vitally affected for the reason that the action of the Detroit & Cleveland Navigation Company in taking its boats off the Mackinac Island run deprives Harbor Beach of waterway shipping facilities for perishables.

Philadelphia—Stockholders of the Pennsylvania Railroad have been notified of a meeting in this city, March 8, at which they will be asked to approve an increase of $100,000,000 in the indebtedness of the road so that it can finance itself and aid subsidiaries, and also to vote on the ratification of long-term leases with 16 other railroad properties controlled by the system.

No Further Decrease In Tire Prices Seen

An Akron dispatch to the Wall Street Journal says in part:

"That reductions in tire prices have been greater than declines in cost of manufacturing is the contention of Akron rubber men, who say the public need not look for further reductions before making spring tire purchases.

"Tires today are selling for less than they did six years ago and the service given by them because of the use of additional cotton and the innovation of the cord tire has more than doubled mileage.

"Thus, in the opinion of Akron men, the tire companies are giving twice as much for less money than they did before the war.

"Regardless of the fact that the price of tires did not skyrocket as did other commodities during the war reductions in prices ranging from 3 to 20 per cent were announced within the last two months.

"Goodyear announced decreases ranging from 3 to 15 per cent on pneumatic tires and a straight reduction of 15 per cent on tubes. Goodrich followed within two days with reductions ranging generally up to 15 per cent, with some sizes being reduced as much as 20 per cent.

"Miller Rubber immediately thereafter announced a cut in prices averaging from 10 to 12½ per cent on fabric tires, 15 per cent on tubes and 12 per cent on cord tires.

"Announcements by these three large companies were followed by announcements from practically every company in the Akron district with the exception of Firestone Tire & Rubber Company, which has made no official announcement of a cut.

"In the face of these reductions it is pointed out that wages in the factories have been reduced in only one instance and the majority of the factories are using raw materials purchased on the old price basis.

"Practically half of the rubber used in Akron was purchased when the market was above 55 cents a pound and the fabric was brought in long before the mills in the East cut prices to their present levels.

"The rubber and fabric market is near its lowest point, and dealers who have asked for a further reduction of prices have been informed that the Akron companies will do all in their power to live up to the contracts for rubber and fabric made early last year to prevent wholesale cancellations."

Industrial Building

Detroit—The week ended January 27 was not very active as far as letting of contracts is concerned. The list from the Detroit Builders & Traders' Exchange shows among the jobs awarded the following: Remodeling and alterations to a store building at Michigan and Military avenues, into a bank branch for the Dime Savings Bank; alterations to the three-story office building at 90 Griswold street, for the Federal Bond & Mortgage Company; a two-story ladder house for the city fire department, and a two-story store building. New projects coming from the offices of architects include a brick addition to the Gray Motors Company plant; a 15-apartment building; an addition to a factory, and a new police headquarters building.

Lansing—The Columbian National Fire Insurance Company will erect an addition to its present building, which will be 50 by 20 feet, two stories high, of fireproof construction and will be used for vaults and storage of records and files. Work will be started at once. The company moved to Lansing from Detroit last May.

Lansing—The Briggs Company sales department expects a building boom in the state this year. It reports that plans for 300 buildings of a public or semi-public character are in the hands of architects.

Mason—Progress is being made in the installation of equipment at the plant of the Telling-Belle-Vernon Company, and while no definite date for the opening of the plant has been fixed, it is hoped to start operations by

Jackson—The $250,000 power plant of the Jaxon Steel Products Company, considered the most modern unit of the kind in this city will be completed by April, according to present indications. Most of the materials used were obtained in Jackson and the labor was local also.

Grand Rapids—The Grand Rapids Chair Company plans the erection of two plant additions, one three stories high and the other one-story.

River Rouge—The Rouge State Bank has had plans drawn for a building at Linden and West Jefferson avenues.

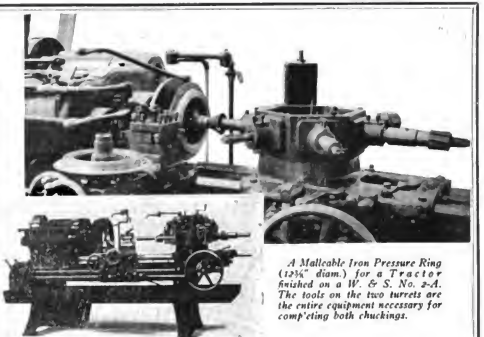
1921 Detroit Motor Show Facilities Greatest Ever

Once more the problem of housing Detroit's annual automobile show has been solved, and the largest show in the history of the Detroit Auto Dealers' Association is promised for the new manufacturing building of Morgan & Wright, Jefferson avenue at Bellevue, from March 19 to 26. Through the desire of the officials of the United States Tire Company to see Detroit put on a show in keeping with her predominating position in the automotive field, the annual dilemma has again been conquered, but without the unselfish assistance of these tire manufacturers it is probable that the fourth city of the United States would have been forced to do without the big event.

All exhibits, as told in this paper last week, will be arranged on one floor, which contains 150,000 square feet of exhibition space. It is difficult to comprehend just what this means, but when it is stated that this is more room on one floor than the show occupied on five floors of the former Ford branch building at Woodward and the Boulevard, last year, the magnitude of this building will be realized. Having all exhibits together where they can be inspected easily without the necessity of going from one floor to another, is the ideal arrangement.

The officials of the United States Tire Company have put forth concerted efforts for some time past to make it possible to turn the new Morgan & Wright building over to the dealers, but on account of many delays in construction, they have not been able before definitely to promise anything. Even now it is necessary to push construction work to the limit in order to have everything in readiness by the middle of March. At a conference last week between officials of the United States Tire Company, Lockwood, Greene & Company, engineers; Stone & Webster, builders, and the D. A. D. A. the possibility of Detroit's going without a motor show were discussed. The engineers and contractors went into the matter at length and finally agreed that the building could be completed.



As in former years, the 1921 Detroit event will again be a leader from the standpoint of completeness, as it will be possible to exhibit passenger cars, commercial vehicles, accessories and equipment all in one show. But few cities are able to include commercial cars in their annual exhibits and the Detroit event has gained a reputation as being the most comprehensive of any held in the United States.

Adequate facilities for taking care of show crowds also are provided. It will be possible to accommodate at least 1,000 people in the lobby leading to the exhibition hall proper. This means that facilities for getting into the show without waiting in line will be far superior to any previous Detroit show.

Applications for space which have been placed on file awaiting the announcement of the show are much greater than ever before, so it is probable that even with the additional floor space which the Morgan & Wright building offers, it will be necessary to hold exhibitors down in the matter of space alloted in order to care for all who make application.

Grand Rapids—Announcement has been made that the Pere Marquette Railway will close its shops here, in Saginaw and in Ionia for 30 days. One thousand men will be laid off.

MICHIGAN MANUFACTURER AND FINANCIAL RECORD

EDITORIAL

DETROIT, SATURDAY, FEBRUARY 5, 1920

Mr. Ford and the Gossips

DURING the past two or three months the public press of this country has carried and the public gabblers have rolled under their tongues, all manner of gossip concerning the Ford Motor Company organization, which is peculiarly a creature of Michigan and, to a very large extent, one of the objects of pride in this state. This gossip has been both original and interesting, has varied in its quality from the wildest imaginings to the most assured fact, and has been seasoned with deductions from the facts that may have been either warranted or unwarranted, depending on what percentage of the facts has reached the public and the people who made the deductions. The variety of conclusions drawn has, in its turn, been quite wide in its character, the swing of the particular pendulum including an arc starting from the mere statement that Mr. Ford is "housecleaning" to that of the Wall Street Journal that Mr. Ford is coming to the end of his rope, so far as the ability of one man to manage a great business single-handed is concerned.

Upon this basis of fact and fancy a great public interest in the future of Mr. Ford's industrial organization has been developed, which is at this stage merely in the state of a public interest, but which with the supply of a very little more of the propaganda which seems to be so readily available, could be turned into a public sentiment against the Ford organization, which would be a very bad and an equally undeserved thing. It is quite conceivable that in the hands of a few dexterous demagogues, the Ford industry could be made quite as reprehensible, in a popular sense, as the harvester's or the packer's industry has been made in the past. And it is not desirable that this should be the case.

It is always bad manners to discuss the private affairs of a private concern and this paper does not intend to do so in this case. But even private concerns become so much affected by the public interest that there are phases of their activities which may, properly and decently, become the subject matter of the public interest and discussion, and should, as in this case, become such a subject.

The first thing that is being lost sight of in the public discussion of the Ford Motor Company's affairs is that it is the biggest industry in Michigan of any kind today, that it has come up from nothing but Mr. Ford's dogged tenacity of purpose, that it has made millionaires of dozens of people besides Mr. Ford and has paid wages which have done a great deal to effect the redistribution of the immense income which it has come to enjoy among the largest possible number of people, from the common laborer to the ostentatious persons who have from time to time left its service, because they could not agree with the policies of its management. It is not going too far to say, either, that, despite some of the flagrant mistakes which he may take credit for, Mr. Ford is personally one of the most popular men in Michigan. The "Henry" which describes both himself and his product may be set down as an expression of popular affection. He is the first industrialist of Michigan who undertook to do very big things and succeeded, remaining in Michigan as his home and his base of operations.

The industrial history of this state is quite full of comparisons with Mr. Ford and his industrial achievements. Long before most of the active men of the present generation were born we had an industrial leader in the person of Eber B. Ward, whose vision was great, whose training was limited, and whose life was short. Capt. Ward, had he lived, would probably have anticipated the late Mr. Carnegie in the making of the East into a steel center, and would have established the center of steel making in the West. He had "the jump" on Mr. Carnegie by having possession of the process of steel making invented by William Kelly, which was identical with that later and independently developed in England by Sir Henry Bessemer. But poor basic training made Ward slow to grasp his advantage and a comparatively early death put an end to his adventures in the promotion of a country-wide industry.

Later on in our industrial history the city of Detroit had an opportunity to become the center of the constructive efforts of George M. Pullman. The older people say, although the history is a bit indistinct, that the industry later founded at Pullman, in Illinois, might have been developed at Detroit had the city seen its way to close some streets and given it a chance to develop a factory site. Be that as it may, the city didn't close the streets, the Pullman factory already established in Detroit was closed, and the parent industry was developed in the Chicago industrial district.

Still later the people of Detroit and Michigan came to look with much deserved respect and interest upon the industrial adventures of the late Senator McMillan and his associate, Mr. John S. Newberry. These men developed great things for their time, including the car-building industry, the charcoal iron industry and the iron foundry industry, and in connection with these had much to do with the development of the state's railroad system. But the car-building industry passed away with the timber supply, the charcoal iron industry became merged with other organizations and their great creators took up other interests of the capitalistic rather than the industrial type.

The first great Michigan industry to grow up to world magnitude was the motor car industry, in which Mr. Ford was a pioneer. Under his guidance and control, and later what seems to be his sole ownership, the industry has become great enough to compare with the steel industry, the agricultural implement industry and others of great public service. The individual plant of Mr. Ford's company is comparable with the Krupp plant at Essen, in Germany, before the world war. It is four times as great, from the standpoint of men employed, as Harlan & Wolff's shipyard at Belfast. The single Ford motor car plant employs more men the year around, and at better wages, than were ever employed in the greatest mining camp this continent has ever known. In terms of men employed and of value of product turned on the public market, it makes the De Beers diamond syndicate and its operations look like small change. It is, therefore, really and comparatively, one of the big industrial things of the world.

This industry belongs to Detroit and to Michigan. It is so firmly rooted therein that nothing but an industrial cataclysm could remove it therefrom. It is a creation to be valued for what it means to development. In its wake came scores of industries for whose products it forms an outlet. When Ford shuts down, for even so short a time, a lot of other factories marked with less widely known names must shut down, too. And when they shut down a hundred thousand men in Michigan are out of work.

Digitized by Google

It would, therefore, be a very great calamity to this city and state if anything serious happened to the Ford organization. Nor can we believe that anything serious will happen to it. To begin with, the motor industry in this country is not at an end, nor is it likely ever to be at an end. There are literally millions of people in the United States today who have never ridden in a motor car. The products of 16 years of production are wearing out annually and must be replaced. The Ford product is the primary one in demand for these replacements.

The Ford organization may be in the market for money. This is only strange in industry so far as it concerns this one organization. But it will get money if it wants it, just as every other industry has gotten money in the past and will in the future.

Mr. Ford may have made a mistake in running for senator, but that was corrected by his not getting it. At that, he almost got it, but it was good that he was not diverted from his industrial idealizations by the cares of a mighty humdrum office.

Mr. Ford undoubtedly makes a mistake and does an injustice by his attacks on the Jews. But the Jews have had even more powerful men than Mr. Ford attack them in the past, and have survived as a mighty useful, industrious and cheerful set of people. They will survive Mr. Ford's attack, too. Nor is it likely that they will wreak vengeance on Mr. Ford, first of all, because they are too sensible, next because they could not crush him if they tried, and lastly, because they are business folks who know that profit is to be derived from progress rather than from ruin.

But the basic fact is that none of these things have to do with the public attitude toward such an industrial organization as Henry Ford has created and now maintains. The public interest is in the continuance and growth of such an organization, and as many more of its type as the future may have in store for us, especially here in Michigan. No amount of gossipy criticism can effect good in such a development. The ability which can measure the hole is vastly more widely diffused in human nature than that which can estimate the food value of the doughnut. So just at this moment we believe in saying, "Three Cheers for Henry Ford."

The Mails and Foreign Trade

THE BUSINESS INTERESTS bent on extending the country's overseas commerce are so intent on the larger phases of the problem—such as credit and transportation facilities—that little attention is being paid to some of the less-advertised agencies which are working just as earnestly, if less conspicuously, toward the same end. That, however, does not detract from the importance of the service these latter organizations are rendering. When all the other machinery has been provided—if, happily, that day ever should arrive—it will be found that the accomplishments of the humbler laborers are of scarcely less import.

One of the latter helpers which has gone about its work unostentatiously but effectively is the Advisory Committee on Foreign Mails, which is affiliated with the National Foreign Trade Council. This committee has addressed itself to the task of broadening and extending the parcel post service to foreign countries and at the same time to bringing about in the general mail service conditions most favorable to American exporters. A statement just issued by H. H. Morse, of Boston, a member of the governing board of the committee, sets forth briefly some of the work the committee already has done, as well as some of the problems still confronting it. It is an enviable record.

It is largely due to the activities of the committee, the statement recounts, that the parcel post service has been extended to include nearly every country in the world, as against the mere handful included less than two years ago; that the combination package which permits the sample and the sales letter to travel together at different rates of postage was introduced; that the C. O. D. service with the Philippines was established; that the limit on weight with some foreign countries was increased from 11 pounds to 22. It was due to the advice and suggestion of the committee that the American delegates to the Universal Postal Union Congress, in Madrid, last October, successfully fought down the proposal to increase international postal rates, and, in so doing, brought about with great skill the creation of a new Pan-American-Spanish postal convention. When the latter becomes effective within the next few months domestic rates of postage will be permissible on letters addressed to Spain and all the countries of Central and South America, including Mexico, Cuba, the Dominican Republic and Haiti; domestic rates will apply to postcards and printed matter, and the weight limit of newspapers, printed matter and commercial papers will be increased, when sent thus, from two to four kilograms and from two to five kilograms in the maximum weight limit for single volumes of printed books. The dimensions of these articles in the form of roll are increased to a maximum of one meter in length and 15 centimeters in diameter.

It is the committee's intention to continue its efforts to obtain extension of the parcel post to all territories not yet reached; to procure the greatest increase in the weight of packages that is feasible, and to develop the foreign mail service in every way so as to make it of the largest service to American concerns engaged in world commerce.

The members of the committee now number 178, among whom are the executives of some of the foremost manufacturing organizations in the United States. An effort is being made to add to the roster, through the committee's secretary, D. W. Thayer, whose office is in Washington. The organization is worthy of the support of business generally.

Short Measure Stuff

MYSTERY

Now what in the world will Bergdoll do,
If Germany gets in a fight?
Will he hie himself over to Timbuctoo,
And give the reporters some work to do,
And think that he did something bright?

But there's something about it that puzzles me,
You might help me out if you will.
Why should he have hied himself o'er the sea,
When by waiting a bit he would soon be free
To go into vaudeville?

THE MOVIE FAN'S BILL OF COMPLAINT

First we had a lot of bronco
Busters roaming western plains,
Who could hug a maid while blowing
Out the city feller's brains.

Then the vampire misses slithered
From the movie studios;
Drove strong men to ruin by merely
Showing bits of silken hose.

Now it's sex stuff that they're shooting,
All the ladies are betrayed,
They are handed back their virtues
In the last reel, sadly frayed.

They have used up legs and shoulders,
Hills and halls, saloons and beds;
But I hope to see a movie
Some day, where they use their heads.

FINANCIAL

Gladys-Belle Oil Leads Detroit 'Change Trading

Three hundred eighty-one thousand, seven hundred ninety-eight shares of stock were traded on the Detroit Stock Exchange during the period from December 30, 1920, to January 28, 1921, according to a tabulation issued this week by the secretary of the Exchange. Gladys-Belle Oil, common and preferred, led the total, with 95,185 shares. Paige-Detroit was second, with 75,590; Continental common, with 45,571, was third; Reo, fourth, with 34,635, and Packard common, fifth, with 34,212. The Stock Exchange statement follows:

SURVEYING THE POSTAL SERVICE

B. K. Muir, of the engineering firm of W. B. Richards & Company, New York, is in Detroit making a survey of the postal service. Mr. Muir is one of a staff operating under the direction of the Richards company, which was engaged by the Congressional joint commission on postal service to determine the exact status of the service and report by March 1.

The cities in which the survey is being made are Detroit, New York, Chicago, Boston, Philadelphia and Washington. Every detail connected with service is being examined.

JANUARY BUSINESS CHECKINGS

January checkings as to business conditions made by the National Bank of Commerce, Detroit, among representatives of a number of lines of trade in the city, show an improvement as far as the future is concerned, but are not quite so good as to present business conditions, when compared with the December checkings. The result of the tabulation is given herewith:

Future Business Conditions—Improving: January, 1921, 22.22 per cent; December, 1920, 12.19 per cent. Stationary: January, 45.68 per cent; December, 53.66 per cent. Declining: January, 32.10 per cent; December, 34.15 per cent.

Present Business Conditions—Above Normal: January, 3.70 per cent; December, 3.66 per cent. Normal: January, 4.94 per cent; December, 7.32 per cent. Below Normal: January, 91.36 per cent; December, 89.02 per cent.

RESERVE CITY BANKERS' CONVENTION

The Association of Reserve City Bankers will hold its annual convention at the Lafayette hotel, Buffalo, Thursday and Friday, June 2 and 3, according to an announcement sent out this week by Fred W. Ellsworth, president of the association. Mr. Ellsworth is vice-president of the Hibernia Bank & Trust Company, New Orleans.

$638,445,000 Is Invested In Utilities in Michigan

A total of $638,445,000 is invested in public utilities in Michigan, according to a report made by the Michigan Public Utilities Commission to Gov. Groesbeck. This does not include the assessed value of express or telegraph companies within the state. Of this total, approximately $246,445,000 has been invested by steam lines. Electric light and power companies are next with $142,000,000, while $140,000,000 has been invested in electric railways. The telephone and gas companies present an aggregate of $110,000,000.

The Commission has found that 199 cities and villages own and operate utilities supplying water to the public, while 103 towns have invested in electric light. There are 75 cities supplying power to industrial plants, while three own and operate gas plants.

During 1919 the public paid to privately owned utilities a total of $235,000,000, or an average of $100 for each citizen. The Commission regards two telephone systems in the same locality as a waste and is endeavoring to eliminate one in each case.

The cost of the Commission to the state was $620,351.45, while $612,233.26 was turned into the state treasury.

It is possible that Rep. Lemuel G. Dafoe, Alpena, will introduce legislation to give the utilities commission exclusive rights over all utilities, with control of rates. He declares that with localities in control, politics frequently govern action to the detriment of all concerned.

WHITE STAR LINE

Following is the balance sheet of the White Star Line, as of December 31, 1920, as submitted to the Detroit Stock Exchange this week:

ASSETS

Permanent and long term investments	$1,451,931.44	
Less reserves for accrued depreciation	229,065.39	
		$1,222,866.05
Working assets		71,979.06
Deferred debit items		15,887.85
Sinking fund assets		38,000.00
		$1,346,632.96

LIABILITIES

Capital stock		$ 750,000.00
Long term bonds		246,000.00
Working liabilities		125,287.96
Accrued liabilities not due		19,050.39
Operating reserves		5,442.10
Other deferred items		26.00
		$1,144,799.35
Surplus accounts		203,834.61
		$1,348,633.96

TWO NEW INSTITUTIONS

Two new state banks appear in the list of incorporations prepared this week in the office of the Secretary of State. One is the State Savings Bank, West Branch, which has capital of $30,000, with R. C. McKay and William T. Yeo, West Branch, and James McKay, Prescott, as the principal incorporators. The other is the Byron Center State Bank, Byron Center, with capital of $25,000. The principal incorporators of this institution are Raleigh Deweerd and Peter Holleman, Byron Center, and Daniel Burgess, Ross. Both banks will do a commercial and savings business.

Board of Directors—H. E. Bartlett, D. C. Whitney, E. G. Swift, H. M. Campbell, Arthur Buhl, Jerome H. Remick and H. B. Mason, and the officers are as follows: President and general manager, J. E. Bartlett; vice-presidents, D. C. Whitney, H. M. Campbell; treasurer, Ernest G. Swift; secretary, Harry B. Mason; assistant secretary, John C. Spratt; assistant treasurer, S. S. Coleman; auditor, N. F. McLeod.

UNION STEEL PRODUCTS, ALBION

The Union Steel Products Company, Albion, paid $25,000 in bonuses to its 225 employes last year. This is more than the total of the sales of the company in 1906, the year it started in business. The bonus is paid to employes with the concern one year or more. The plant operated normally, in fact to capacity, all of last year, except during the last two weeks of December.

WHERE DID *YOUR* SURPLUS GO?

WHAT became of the surplus earnings of your organization in the period of marked activity and generous profits from which business recently emerged?

Did they go into extensions and improvements, now made unproductive by lessened business activity; into expanded inventories, now written off appreciably through readjustment in values; into dividends, now disbursed so as to afford no relief at a time when credit may have been badly needed?

Or did they go into a bond reserve fund of safe, readily salable securities, earning interest regularly and providing the best possible basis for credit which otherwise might not have been available?

Perhaps never more forcefully than in the business transition experienced in the past several months has the wisdom of a bond reserve fund been demonstrated. With many organizations such a fund has in this period meant the difference between successfully meeting a difficult situation and possible serious embarrassment.

For businesses, as well as for individuals, already committed to the wise policy of setting aside regularly a portion of their surplus in a bond reserve fund, we have an extensive list of suitable bonds from which to choose and a valuable advisory service to offer.

For those who may be considering such a move, but who are not yet definitely committed to it, our extensive experience will be found distinctly helpful, both in the preliminary investigations and in the final selection of appropriate investments.

May we send you our booklet—"Choosing Your Investment Banker," together with our latest list of bond offerings? Ask for list FG-8.

General Financial News

STOCKHOLDERS' MEETINGS

Annual meeting of stockholders of the following companies have been announced: Ajax Rubber Company, February 23; American Can Company, February 8; Central Leather Company, February 23; Consolidated Cigar Company, February 21; Consolidated Gas Company, (N. Y.), January 24; Detroit Edison Company, February 7; Pacific Gas & Electric Company February 10; Pennsylvania Railroad Company, March 8; Stromberg-C. L. & C. Company February 10; Pressed Steel Car Company, February 16; Saxon Motor Car Corporation, February 8; Seneca Copper Corporation, February 8.

COLUMBIA GAS & ELECTRIC

The Columbia Gas & Electric Company has increased its quarterly dividend rate 25 cents, or to $1.50. During 1920 the net increased $1,359,000 over that of 1919, the total at the end of the year being $7,235,000. On December 31 the surplus was $4,836,000.

TRADE BANK STOCK SALE ON

Papers incorporating the Foreign Trade Financing Corporation with an authorized capital of $10,000,000 were filed with the Federal Reserve Board in Washington, late last week, and approved by the Board. Attention was drawn to the fact that the Board, in granting the charter to this corporation, has approved the inauguration of an institution with a greater capital than any other institution of its kind in the world. The corporation is being organized under the terms of the Edge Law in order to assist in the maintenance and development of the foreign trade of this country through the extension of long-term credits to foreign buyers of American goods. The funds available for the extension of such credits will be derived from the sale of debentures to the investing public. The corporation will be permitted under the law to issue such debentures to the amount of $1,000,000,000. Sale of the capital stock began this week, prospectuses having been sent to the country's 30,000 banks as well as to thousands of manufacturers and producers.

NEW STOCKS ON 'CHANGE

The New York Stock Exchange has admitted to list the following, among others: Detroit Edison Company, $2,000,000 stock, on notice of issuance at par for equal amount of 10-year, 7 per cent convertible debenture bonds, due February 1, 1929; Duquesne Light & Power Company $31,718,500 first mortgage and collateral trust 60-year bonds, series A, due July 1, 1949; American Chicle Company, temporary certificates for 149,336 shares of common; Kelly-Springfield Tire Company, $1,250,000 additional common, on notice of issuance as a stock dividend; Granby Consolidated Mining, Smelting & Power Company, Ltd., $2,500,000 5-year, 8 per cent convertible debenture coupon bonds, due May 1, 1925, on notice of issuance in exchange for outstanding temporary bonds; Middle States Oil Corporation, $2,500,000 stock, on notice of issuance and payment in full.

MICHIGAN MUTUAL'S BIG YEAR

For the Michigan Mutual Life Insurance Company, Detroit, the year 1920 was the best in the number of policies written of any year in the company's history.

New policies aggregated $19,900,748, as against $17,933,054 in 1919, and of the total nearly $6,000,000 were issued on lives of Michigan people. Total insurance in force at the end of 1920 was in excess of $87,500,000, against something more than $75,600,000 a year ago. The company's total income was $3,220,910.10, comparing with $2,853,883.85 in 1919. Disbursements were $2,451,618.42, comparing with $2,265,411.51 the previous year. During 1920 death claims were paid amounting to $793,281, as compared with $669,552 in 1919, and $659,786 was returned to living policyholders, as against $660,247 for the previous year. In its 53 years of existence the company has returned $32,976,813 to its policyholders.

Directors re-elected are: J. Mooney, A. F.

WILL SELL MAC-LAR ASSETS

The Wayne Circuit Court has directed the receivers of the Mac-Lar Battery Company, Detroit, to offer at public sale the company's assets, February 14, at the plant, 1046 Third avenue.

DETROIT EDISON STOCK LISTED

The Detroit Edison Company has filed application to have its additional capital stock of $2,600,000 listed on the New York Stock Exchange. Its 8 per cent convertible debentures, series of 1931, have been listed on the Detroit Stock Exchange.

SCOTTEN-DILLON STOCK INCREASE

Directors of the Scotten-Dillon Company, Detroit, have voted an increase in the capital stock from $1,500,000 to $3,000,000 and have authorized the distribution of a 50 per cent stock dividend equivalent to $750,000. The outstanding stock is now $2,250,000, in shares of par value of $10. This is the third important stock dividend in 10 years.

WABASH 1920 EARNINGS REPORTED

Gross earnings of the Wabash Railroad for 1920 are reported as $5,720,548, those for 1919 being $4,312,598. Net operating deficit after taxes was $440,476, compared with a net operating income of $747,073 in 1919.

PRESSED STEEL CAR MEETING

Stockholders of the Pressed Steel Car Company have been notified of a meeting February 16 to vote on an increase in common stock from $12,500,000 to $50,000,000, declare a 20 per cent dividend on the common stock and exchange $12,500,000 of preferred stock for an equal amount of common.

MOTOR WHEEL MEETING FEB. 15

The tentative date for the annual meeting of the Motor Wheel Corporation, Lansing, has been set for February 15.

KEENA ON UNION TRUST BOARD

James T. Keena, chairman of the board of directors of the Peoples State Bank, has been elected to the directorate of the Union Trust Company, Detroit.

SCHMIDT & DEERY CHANGE

The stock exchange business formerly conducted at 230 Penobscot building, Detroit, by Schmidt & Deery has been taken over by the firm of Howell & Wales, of New York, Chicago, Pittsburgh, Cleveland and Detroit. The former firm of Schmidt & Deery was dissolved by mutual consent as of December 31, 1920. The business will be continued in a manner similar to that of the former firm.

REALTORS INCREASE CAPITAL

The J. W. Bailey Company, real estate, Lansing, has increased its capitalization from $25,000 to $200,000, of which $120,000 will be common and $80,000 preferred. The increase was made to care for the growth in the business.

GREAT LAKES DREDGE ASSETS

The Great Lakes Dredge & Dock Company reports net cash assets of $3,400,000 for 1920, the largest in its history. The company's earnings exceeded those of all previous years.

BRIDGMAN SEEKS ANOTHER FACTORY

Bridgman is expecting to obtain a new industry shortly. The business men are now negotiating with parties interested in a wall board factory.

In the Transfer of Stock

many technical points arise where experience and knowledge of law prevent loss and embarrassing situations.

That is why corporations appoint this Company as their Registrar and Transfer Agent. Our charges are moderate.

SECURITY TRUST COMPANY
FORT AND GRISWOLD STS. CAPITAL AND SURPLUS $1,000,000.00 DETROIT

Triple Assurance

Owners of our First Mortgage Bonds are secured three-fold; by the legal obligation of a responsible mortgagor; by the collateral security in the form of Detroit income producing property worth double the amount of the mortgage; and, by the seven millions of dollars of resources of this successful going concern.

But interest yield is not dwarfed by safety.

These bonds pay **6%**

CLARKSON L. FARNSWORTH DEATH

Clarkson Lewis Farnsworth, son of Col. Fred E. Farnsworth, former general secretary of the American Bankers' Association, died January 7 at his home, Glen Laurel, Huntington, L. I. He was born in Detroit, educated in Hamilton Institute and Cornell University, was editor of the weekly paper of the Advertising Club of New York City at one time, and until his last illness, which lived five months, was with Murray, Howe & Company, New York. During the war he was a chief clerk in the division of automotive and accessory purchases under Col. Edwin S. George, Detroit.

WILL URGE STATE TRADE BODY

When the Michigan State Association of Commercial Secretaries meets in Port Huron, February 17, John I. Gibson, secretary of the Battle Creek Chamber of Commerce, will urge the formation of a state organization of commercial clubs and boards or chambers of commerce.

Investment Hints

SHORT AND LONG-TERM INVESTMENTS

Illustrative of how many investors do not comprehend the fundamental terms of bond and note issues in the following: Imbrie & Company, Murphy building, Detroit, sent a circular descriptive of the Beaver Board Company 8 per cent notes to a physician client in a nearby Michigan town. The doctor replied that he was interested in the notes, which are due in 1932, and asked: "Does 'due in 1932' mean that I have to wait 12 years for the return of my principal?" The reply to this client is given not only as illustrating the meaning of the term inquired about but also because it throws considerable light on the proposition of long-term versus short-term investments made at this time:

"We have your favor of the 20th inquiring as to whether an investor has to wait until maturity before he realizes his principal should he buy Beaver Board 8 per cent notes, due in 1932. In this market, investors are seeking the longest maturities possible when they buy bonds. Money is higher now than it has been for a good many years. Everyone expects to see cheaper money in the near future, and for this reason are not buying securities unless the maturity is some years distant.

"Every good security has a market whether it is listed on the New York Stock Exchange or not. We understand that application has been made to list the Beaver Board notes on the New York Exchange. Anyone holding these bonds has a perfect right to sell them any time, at whatever the market is. Should money be cheaper in, say, two years from now, bonds of this character will be selling on about a 7 per cent basis, which would mean that they would sell at a premium of about 7 points.

"If you were to invest in securities due in two years, just now you could get about 8 or 8½ per cent on your money. At the end of that time you would have to accept, say, about 7 per cent, and if money continued to get cheaper later on, possibly 6 per cent, so you can see the advantage of investing in a reasonably long-time bond.

"Bond men do not consider 12 years a long-time bond, as there are a good many bonds due in 50, 60 and 70 years. Securities due in eight and ten years are usually called short-time notes."

Public Utilities

Grand Rapids—The Commonwealth Power, Railway & Light Company has made the following promotions in its official staff: Jacob Hexma, from secretary and treasurer to vice-president; G. H. Bonrne, from assistant secretary and treasurer to secretary; George Sprague, Jr., treasurer; H. S. Kessler, comptroller; E. E. Nelson, assistant secretary; O. R. Coleman, assistant treasurer.

Port Huron—The city commission has refused to permit the City Electric Railway Company to operate its one-man cars on the streets. Mayor French informed the company that after investigating the operation of the cars in other cities he was satisfied that public sentiment was opposed to them. The city of Detroit is putting some of these cars into operation on its M. O. lines.

Grand Rapids—At the meeting of the board of supervisors of Kent county, to be held this month, John A. Becker will make application that permission be granted him and his successors or assigns to develop the water power on the Thornapple river, near Ada. The work includes the building of a dam.

Who's Who In Michigan Finance

Loren J. Kuehnle, Cashier, Merchants Savings Bank, Battle Creek.

Mr. Kuehnle was educated at the University of Michigan and received three and a half years' experience in the First National Bank of Ann Arbor in all departments of the bank. He then joined the sales staff of Watling, Lerchen & Company, Detroit, as a bond salesman, following which connection he engaged in business for himself at Ann Arbor, handling Hoover Steel Ball stocks. He left this business to join the Army, and upon his discharge became a state bank examiner under Commissioner Merrick. The latter post he gave up to become cashier of the Merchants Savings Bank of Battle Creek, November 8 last.

LOREN J. KUEHNLE

Cities Service Co. Nets $17,370,464 During 1920

Cities Service Company closed 1920 with gross earnings of $24,698,039 for the year, an increase of $4,720,489 over 1919. After providing for all expenses, taxes, interest, preferred dividends and other charges, the balance for the year, available for reserves, dividends on the common stock and surplus was $17,370,464, an increase of $4,234,573 over the preceding year. This balance for 1920 was equivalent to $43.09 a share on the average amount of common stock outstanding, as compared with $39.09 in 1919. Requirements for payment of preferred dividends were earned 4.71 times in 1920, compared with 4.12 in 1919. Earnings for December, 1920, showed a good increase over December, 1919, although while utility earnings for December, 1920, showed decided increases, there was somewhat of a falling-off in earnings from the oil division for the month, compared with the preceding month, because of the curtailment of pipe line runs in the Mid-Continent Fields.

The public utilities division reported increases in both gross and net earnings for December. In the face of the retardation of industry in many sections, combined gross and net earnings of public utility subsidiaries were greater for December than gross and net for the corresponding month of the year before or for November, 1920, the latter having been the best previous month for the utilities in the history of the company. Further increases in rates were granted during December to Knoxville Gas Company, Montgomery Light & Water Power Company, Webb City & Carterville Gas Company and Carthage Gas Company.

STATEMENT OF EARNINGS, DECEMBER 31, 1920

	12 Months Ending Dec. 31, 1920	12 Month Ending Dec. 31, 1919	Month of Dec., 1920	Month of Dec., 1919

SAGINAW

Bank of Saginaw—Directors: Benton Hanchett, Helon B. Allen, Arnold Boutell, Edgar D. Church, William J. Cornwell, John H. Dwight, A. T. Ferrell, Fred J. Fox, George H. Hannum, Theodore Haas, John L. Jackson, Charles A. Khuen, James G. Macpherson, John Popp, E. A. Robertson, Otto Schupp, G. M. Stark, George W. Wendon and William Wickes.

Second National—Directors: George B. Morley, Stanford T. Gage, Frank D. Eaton, Arthur D. Eddy, James B. Peter, William H. Wallace, Frederick Carlisle, Peter Corcoran, Charles A. Bigelow, Elliott J. Cornwell, James T. Wylie, R. Perry Shorts, George H. Boyd, Amasa M. Rust, John W. Rust and Edward W. Clifford.

People's Savings—Directors: J. J. Rupp, Harry T. Wickes, S. E. Symons, William B. Baum, L. P. Mason, C. W. McClure, J. P. Boynton, Peter Drummond, and H. E. Oppenheimer. Officers: President, J. J. Rupp; vice-president, William B. Baum; secretary and treasurer, J. P. Boynton; assistant treasurer, B. P. Griffin.

Commercial National—Directors: George A. Alderton, Joseph W. Fordney, J. F. Brand, A. C. Melze, A. A. Anderson and C. A. Maynard.

American State—Directors: Charles Bauer, E. L. Beach, C. Cummingham, C. D. Davies, O. L. Dittmar, W. H. Filbert, G. S. Garber, W. F. Hemmeter, Edwin Kerstin, Frank H. Kohn, H. Krause, J. R. Liebermann, H. C. Remer, H. T. Robinson, Louis L. Schuiz, W. C. Wiechmann and Henry Wilcox.

ST. JOHNS

State Bank of St. Johns—Directors: Dr. M. Weller, A. E. Wilson, C. T. Babcock, Otis Fuller, G. G. Hewitt, C. A. Jones, and E. L. Thome. Officers: President, Dr. M. Weller; vice-president, A. E. Wilson; cashier, Frank Thome; assistant cashier, Walter Wykoff.

St. Johns National—Officers: President, J. C. Hicks; vice-president, C. T. Babcock; cashier, H. C. Dexter; assistant cashier, Hugh Watson. Directors: C. T. Babcock, C. A. Coleman, O. E. Dewitt, P. E. Walsworth, W. M. Smith and R. C. Dexter.

Farmers' State Savings—Officers: President, R. S. Clark; vice-president, Jesse Sullivan; cashier, E. A. Hamady; assistant cashier, R. D. Letts. Directors: R. S. Clark, Jesse Sullivan, L. D. Parr, D. C. Barron, Fred W. Swain, Joseph H. Schneider, Joseph Ulrich, John F. Parr, Fred Brown, A. Howe, C. D. Spuir, E. L. Bull, R. P. Hull, Fred C. Burk and E. A. Talmadge.

Clinton County National—Officers: President, J. C. Hicks; vice-president, C. E. Ball; treasurer, R. C. Dexter. Directors: O. P. Dewitt, C. C. Vaughan, W. M. Smith and P. E. Walsworth.

Motor Car Exports And the Tariff

(*Continued from Page 8*)

collectively voted for a uniform tariff of 33 1-3 per cent. This duty was to apply to all automobiles imported into and from any of the countries that entered into the agreement. The Prime Ministers, however, did not ask U. S. tariff on automobiles of over $2,000 in value and fixed the French duty at that rate on automobiles of the type mostly exported from the U. S.

"The establishment of a uniform rate upon cars of all prices at the present minimum of 30 per cent ad valorem, coupled with a reciprocal provision, will isolate the development of foreign trade in that the rate will apply to motor vehicles from such countries only on the current equality of treatment for American products. Against countries which, however, despite the benefits accruing to them because of the establishment of this uniform lower rate, continue to discriminate against American trade, there should be applied additional duties to be determined by law or warranted by the particular circumstances.

"With regard to the administration of a policy of reciprocal relations such as that outlined, the President of the United States should have the power to ascertain what countries discriminate against American trade and to take measures in accordance with this provision to protect United States interests."

SUTHERLAND LEAVES HUDSON

M. R. Sutherland has resigned as planning manager of the Hudson Motor Car Company and Essex Motors, Detroit. He formerly was with the Cadillac company.

INVENTORY VALUATION—For Federal Taxation and Banking Purposes

It is the policy of the Michigan Manufacturer and Financial Record to present to its subscribers articles of timely and vital importance.

That this is appreciated is evidenced in the interest which has been aroused by the leading article on Inventory Valuation of our issue of January 22, 1921.

The issue is now out of print, but for the convenience of our readers the article referred to has been reprinted in pamphlet form.

This article gives the opinion of a well-informed, unprejudiced observer on the subject of importance to the manufacturer, banker, accountant and lawyer; it should prove helpful to those who seek or give credit, plan for the future, or are concerned with the preparation of Federal Tax Returns.

It is not a detailed statement of methods but summarizes principles of valuation that have stood the tests of time and application and are governing in the present conditions.

The author is William M. Lybrand, of Lybrand, Ross Bros. & Montgomery, Accountants and Auditors, New York and Detroit, and we assume that the views expressed are those of his firm, which included Col. Robert H. Montgomery ,author of Montgomery's Income Tax and Excess Profits, Tax Procedure.

Copies of the reprint will be mailed free of charge to those who apply in writing to the Michigan Manufacturer and Financial Record, 611 Free Press Building, Detroit, Michigan.

New Publications

"FACTORIES THAT FIT"

Frank D. Chase, Inc., Chicago, has compiled and issued a highly interesting booklet entitled "Factories that Fit." The purpose of this booklet is to "get across" the Chase conception of sound engineering design in factory construction, namely, the idea of a manufacturer having his plant so fitted to the work it is to do that the processes of manufacture are accomplished in an orderly fashion, and with the least labor cost. "Factories that fit" embraces photographs (both exterior and interior) of some 40 factories in various parts of the country designed by Frank D. Chase, Inc. Included in this list will be found those of the Q. R. S. Music Company, New York city; Samson Tractor Company, Janesville, Wis.; Peerless Foundry Company, Cincinnati; Keith Railway Equipment Company, Hammond, Ind.; Richards-Wilcox Manufacturing Company, Aurora, Ill.; Chain Belt Company, Milwaukee, Wis.; Cribben & Sexton Company, Chicago; Galena Signal Oil Company, Whiting, Ind.; American Wire Fabrics Company, Blue Island, Ill., and others.

The Chase booklet is now being mailed, and can be procured on application.

GOLDEN RULE NUMBER OF "CHARACTER"

The January-February issue of "Character," an attractive booklet issued by Griffith-Stillings, direct advertising specialists, Boston, features an article on the Golden Rule as applied to commerce and industry, and also the suggestion that the week of November 6-12 be observed as Golden Rule Week each year, and Saturday be selected as Golden Rule Day for each week. Opinions of President-elect Harding, Roger W. Babson, Sherman Rogers, John Mitchell and other prominent men, on the value of the Golden Rule principle in business, are quoted in the leading article in the book.

ELECTRIC GOODS IN SOUTH AFRICA

The Department of Commerce has issued Special Agents Series No. 205 report, dealing with "Electric Goods in British South Africa." The report may be obtained for 20 cents from the Superintendent of Documents, Government Printing Office, Washington, D. C.

This report was prepared by Trade Commissioner R. A. Lundquist, who says that during 1919 more than $5,000,000 of electrical and allied material was imported by South Africa. The principal city is Johannesburg, which is the logical selection for American manufacturers of such goods who contemplate establishing a representative in the South African market. The Transvaal, of which Johannesburg is the principal city, bought approximately $68,000,000 worth of all kinds of machinery, supplies, etc. Before the war Germany was an important factor in the electrical goods market, but since 1914 very substantial gains have been made by the United States.

DETROITERS ON PAINT COMMITTEES

Three Michigan men have accepted invitations from President S. Marshall Evans, of the National Paint, Oil & Varnish Association, Inc., to serve on committees during the present year. George E. Moser, Jr., Detroit, is a member of the adulterated oil and turpentine committee; F. L. Colby, Detroit, is member of the naval stores committee, and H. J. Woodlock, Detroit, is one the paint jobbers' committee.

MILD WEATHER HELPS ROAD WORK

The mild weather has made it possible to lay gravel on roads in the southern part of the state and continue other work usually suspended during the winter. If this weather continues, the department will be in a better position to carry out its summer program.

Eastern Truck Sales Possibilities Noted

The Motor Truck Association of America, Inc., New York, which promoted the Highway Transportation Show held in New York January 2 to 8, has compiled some interesting statistics concerning trucks in the six principal states, showing increases since 1915

In New York 23,288 trucks were registered in 1915; 34,653 in 1916; 55,402 in 1917; 92,979 in 1918; 97,346 in 1919, while the estimate for 1920 is placed at 110,000. This means that there was an increase in truck sales of 11,365 in 1916; 20,749 in 1917; 37,577 in 1918; 4,367 in 1919, while for 1920 the increase is expected to total 12,654.

In Massachusetts there were 11,960 trucks in 1915; 18,194 in 1916; 26,964 in 1917; 33,011 in 1918; 53,304 in 1919. The annual increase was thus respectively, 7,766; 8,004; 6,047 and 20,293.

In Pennsylvania there were 8,379 trucks in 1915; 11,732 in 1916; 12,952 in 1917; 31,145 in 1918 and 40,839 in 1919. The increase was thus, respectively, 3,353; 1,220; 18,193 and 9, 694.

There were 4,847 trucks in use in Connecticut in 1915; the number increased to 7,759 in 1916, to 11,819 in 1917, to 15,051 in 1918 and to 22,100 last year. Thus the annual increase was, respectively, 2,912; 4,160; 3,132 and 7,049.

In giving out these figures the Association says it wishes to call special attention to the market possibilities of those states. While New York state is far ahead of all others as to number of trucks in use, the possibilities in the other states are still very great and probably have never been gone after as strongly as in New York state, says the statement.

Production Managers—

Continuous Heat Treatment Furnace.

The following advantages are secured by the Continuous Method of Heat-Treatment:

Increased production per unit of floor space.
Reduction in manual labor per unit of production.

Uniformity of product, resulting in decreased scrap, following less dependence upon the human element.

The fuel economy that naturally follows the direct transfer of heat in spent gases to incoming material.

Improvement in working conditions by cooler shop.

In short, the saving in cost of the finished product due to economy in labor, time, fuel, floor space, decreased rejections, etc.

Do these advantages appeal to you?

Write nearest branch for Bulletin 217-B and learn whether this method is adaptable to your product and manufacturing conditions.

machinery is clearly evidenced here, where 160 of these crankshafts are produced from one machine in eight hours. A front axle for an automobile is made from a bar of 1⅜ by 2-inch steel, 67½ inches long and weighing about 53 pounds.

In 1919 this plant used 24,749,000 pounds of steel and produced 17,292,000 pounds of finished forgings, which were made and delivered to the machine shop at the rate of 5,000 complete sets of drop forged steel automobile parts a month. On the production of these forgings nearly 600 men were employed, drawing an aggregate wage of approximately $100,000 a month. Sixty-five die sinkers are employed in making and repairing the dies with which these forgings are made, and a repair force of 70 men is kept busy keeping the big machine in shape to do their work.

The Production Manager Speaks

Plant Executive of Conservative Detroit Automotive Manufacturer Predicts 60% Peak Output This Year

By F. W. HERSEY

ONE OF THOSE WAGS who always rise to the occasion with a quip or a conundrum applicable to the current topic of conversation has sent on its smiling mission the announcement that Henry Ford has bought the Hotel Statler, Detroit. Naturally the question, "What does he intend to do with it?" is the rejoinder, and the answer is that he intends to fill it with rumors. The joke does not require a diagram.

It is readily admitted that a pun is a crime punishable by slow torture, but there are extenuating circumstances in this case. It would take more than one Statler hotel to accommodate all the rumors about the automotive industry now floating about, and it is only by running as many as possible of them down that any idea of the true course to be sailed by the industry during the coming year can be obtained.

Rumor pessimistic has it that production in the automotive plants for the next year or two will be negligible; that it will take five years for the business to recover from the jolt recently suffered.

Rumor optimistic retorts that production will be not less than 75 per cent of what it was in 1919 and 1920; that the industry is due to recover in a year's time. When in search of information regarding the probable manufacture and distribution of product it is customary to approach the sales departments. Sales managers usually enjoy a broad vision and a beautiful imagination, which when applied to such promising sales indications as exist, produce an acceptable result.

The Iceberg in the Plant

On the other hand, the production managers are cold propositions. They lack imagination and have no time for vision. They deal in concrete facts, three of them—money, men and materials. By being too imaginative, too visionary, the production manager could easily overload his plant with inventory. Therefore he often takes the sales manager's estimate and divides it by a figure which suits him best.

The writer approached such a man for his opinion on production in the industry and his own plant in particular. His factory is included among those marked for conservatism and reputed to be "sitting pretty," with a minimum of financial worry, while so many manufacturers in every line are hustling for money. Not long ago he returned from a trip to Europe, where he had been studying the market for American cars, and within a few days of this interview had returned from an Eastern trip.

"Figure production in the automotive industry for 1921 on a basis of 60 per cent of what it was in 1920," he said in answer to the question. "If it does not exceed 50 per cent, do not be surprised. if it touches 75 per cent, then consider a miracle performed. This is not pessimism, nor is it false optimism. it is what we should expect. We are facing a sales problem after almost 20 years of production problems. From the day the motor car became an acceptable and practicable machine, the energies of the industry have been directed toward perfection and quantity in production.

"Aside from what I consider ordinary sales development, with every encouragement possible from a ready market, there have been no real sales problems. The fight has been to supply the increasing demand and cut production costs so that prices might be tempered in accordance with increasing competition. Look back over the periods in the development of the sewing machine, farm implements and steel and you will find the same principles as are today influencing the motor industry.

"First, there was the period of invention and development. Successful development created demand and production problems followed. The popularity of the sewing machine and farm implements induced rapid expansion of plants and the organization of new companies.

"For 20 years the development of the farm implement industry was as phenomenal for those days, between the 60's and the '90, as that of the automotive industry has been to us of this generation. Then came the reaction from production problems to sales problems. The industry was over-loaded. Plant capacity was greater than demand called for and surplus had to be disposed of abroad. Foreign markets, constautly disturbed by tariffs and exchange fluctuations, were alternately opened and closed.

"When production exceeded domestic consumption and foreign markets did not absorb surplus, what happened? There was depression and the over-expanded industries suffered. Weaker concerns fell by the wayside. The stronger companies united, the sales problem was recognized and the production problems solved by corporate system. Today neither the farm implement nor the sewing machine industry attracts special attention because of depressions.

The Automotive Parallel

"The 20-year period in the motor car industry has been rounded out with production machinery developed to its utmost and with a great number of different concerns manufacturing cars. Our facilities today are sufficient to more than satisfy domestic demand, and foreign markets are almost closed.

"Reconstruction problems and exchange decline are not the only reasons for the stagnation of the foreign motor car markets. The very immediate, quantity production of which we have boasted has been a factor. During the war we manufactured and shipped a vast quantity of automotive products to Europe for war purposes. Trucks and passenger cars were cast loose upon foreign soil after the armistice was signed. They became salvage, and because it was cheaper to sell them abroad than to ship them home, and better business to sell them than to throw them back upon te American markets, the government put them on the foreign markets at lower prices than manufacturers in these markets could sell their own product.

"Two things of interest to American manufacturers resulted from this procedure. A large

THE accompanying article is preliminary to a discussion of the potentialities of the market, within the next year or two, for materials and parts in the middle western automotive manufacturing center comprising Michigan, Ohio, Indiana and Wisconsin, and of which Michigan is the chief commonwealth.

Any examination of this subject must necessarily have to do principally with the sales policies which will be expected by the purchasing agents, who will contract for such materials, and with the mental attitude of these men as the result of the abnormal contractual conditions which have prevailed during the last two or three years. Concerning the latter, readers of the paper will remember, considerable recently was said by Elwood Sampson, of Detroit, chairman of the public relations committee of the National Association of Purchasing Agents.

The article will appear in an early issue.

Digitized by Google

demand undoubtedly existed, a portion of which was satisfied by these sales, and the antagonism toward American manufacturers by manufacturers of French and English cars doubtless was intensified by the low prices made on these cars. There was, however, and still is a very satisfactory demand for approved American cars throughout the world.

"Conditions of exchange and actual governmental and banking opposition to financing American imports into various countries, together with the world-wide slump in business, has created a condition of extreme stagnation in automobile exports for the last six months. This condition is more or less temporary and I am sure you will see a revival of export business. No one can safely become a prophet as to the time that this will take. It is a fact that the markets of the world are not at present overstocked with American automobiles. Conservative judgment would indicate a fairly satisfactory percentage of exports to be had during the current year.

"With such conditions obtaining in Europe and other countries, the consumers' strike descended upon the home markets, and while this strike is only a temporary condition, its effect so far as the automotive industry is concerned must be outlined.

"Take this company as an illustration. In 1920 we had a manufacturing program of about 2,000 cars a month and actually produced and sold more than 80 per cent. The falling-off in production all occurred in the last ninety days of the year. Of this, the foreign market absorbed something more than 25 per cent. Adhering to our policy of conservatism, we shall base our output on about 60 per cent of last year. Should the foreign markets improve more rapidly than now seems likely, this percentage probably will be increased.

"Judging from our position in the market, I believe the same ratios will apply equally well to other plants. In this I see no cause for pessimism, but I deprecate the extremely optimistic statements which have been so prevalent recently, believing that the actual facts do not bear them out and that the fundamental conditions of this country and the world fairly stated, entirely warrant a feeling of security in the business world.

Market Potentialities Revised

"The reaction from a sellers' to a buyers' market has knocked into a cocked hat all previous conceptions of market potentialities. I venture to say that the motor car manufacturer, distributor and dealer knows less about the character of the market today than ever before. They must find and analyze the market, which will call for a different quality of salesmanship than employed behind the counter of a department store.

"Selling motor cars has been more or less of a sporting proposition, with a lot of circus stunts thrown in. It has been full of romance and youthful buoyancy. The industry has now reached the manhood state and the frivolities will have to be removed.

"Henceforth the four fundamentals of success will be finance, management, quality product and strong dealer organization. The companies that will survive this situation, that will show the quickest recovery, will be those having the strongest dealer organizations. The strongest dealer organizations are those which have handled the same car or cars for the longest periods, gathering about them a loyal, satisfied customer followings. Also they are the organizations that have adopted the soundest financial policies.

"On my recent trip through the eastern part of the country I found business slowly picking up. I was surprised at the optimism in evidence, but the best sales predictions, I mean these not slivered with buncombe, bore out my estimate of general automotive production —50 per cent of 1920.

"Personally, I think this depression was the best thing that could have happened. The whole country needed it, and the automotive industry needed it. I do not see any cause for discouragement in the probability of reduced production. The situation calls for real management and salesmanship. Wage reductions must be made and very likely there will be some resentment expressed in strikes. Labor troubles may disturb production to such an extent that a real shortage of cars may result during the summer, but I fail to see how demand in 1921 can possibly anywhere near challenge our present production capacity."

Michigan's Rate Problem of the Moment

If Someone Can Improve on the Zoning System, Well and Good, But Plan Must Be Constructive

RAILROAD has only one way of raising money for operation, and that is from the sale of transportation. If the monies received for such service are not sufficient to meet the bills and interest on bonded debt, the railroad is bankrupt, and a bankrupt railroad is as badly off as a bankrupt individual.

In what I am about to say, please understand that I am not pleading for any railroad in parilcular, but am using the knowledge which came to me when in the railway service and which perhaps covers some details not heretofore made public.

Back in 1916 the rates in this territory were very low, compared with any others in the country, with the possible exception of shorthaul rates in Ohio, where an old statute law was in effect.

The rates were not only low but the operating costs necessarily high, especially the item of fuel. In 1916 about 15 per cent of the total expenses of the Pere Marquette railway were for fuel. In addition to the higher cost of coal was the fact that the winters were much more severe, necessitating more coal per ton of traffic moved, compared with most sections of the country. Under normal conditions the would have been bad enough, but the local conditions in Michigan presented a serious and unique situation.

Michigan an Isolated State

If you will look for a minute at the map of the country you will note that lower Michigan stands out absolutely by itself and occupies a geographical position unlike that of any other state. The upper peninsula of Michigan is very thinly settled and the freight and passenger rates are both on a higher basis than in the southern peninsula. Therefore in discussing this matter we will refer to the lower peninsula of Michigan as Michigan.

By GEORGE C. CONN

Director of Traffic, Buick Motor Company, Flint

It is almost surrounded by the Great Lakes. There are 104 towns and cities in the state reached by both the Great Lakes and the railroads, and they contain about one-third of the population of the state. With Lake Huron on the east and Lake Michigan on the west, the state is isolated and apart from its neighbors. We have no local trade of any account to the east on account of the Canadian customs laws, and there is comparatively little interchange trade between the southern peninsula of Michigan and the northern peninsula which moves by rail. For about seven months in the year there is a certain amount of trade between Detroit and the points in the northern peninsula which moves by water on account of low rates, but there is a constantly increasing business between Chicago, Milwaukee, Minneapolis and Duluth into the northern peninsula, due to better transportation facilities than can be had via the Straits of Mackinaw. The business alliance with Minneapolis is also strengthened by the fact that the Minneapolis Federal Reserve Bank has jurisdiction in this territory. There is more or less interchange of traffic between the state of Wisconsin and lower Michigan handled by the car ferries and the steamers on Lake Michigan, but this is not heavy traffic, compared with that which moves from Chicago and Detroit in lower Michigan.

It can therefore be fairly well stated that a greater proportion of the traffic of lower Michigan moves in and out by rail, largely through Port Huron, Detroit, Toledo and Chicago gateways; and in this respect the railroads of lower Michigan become a distributing and originating facility for their connecting lines.

There are about 6,330 miles of railroad in southern Michigan, and a population under the census of 1910 of 2,485,000, or 392 people per mile of railroad. The population per mile of road in the trunk line territory east of Buffalo is 889, and in New England, 1,389. This means that the railroads in Michigan have only a quarter as many people to draw business from as the roads in New England. This refers to freight as well as passengers, for it takes people to produce freight. Many of the northern counties of lower Michigan are very thinly populated. There are several counties with less than ten people to the square mile, and taking the counties north of a line drawn from Saginaw to Muskegon, the average population is only 26 people to the square mile. In these same counties, according to the Michigan Public Domain Commission, there are 4,000,000 acres of uncultivated land. This would give 50,000 farmers 80 acres each, and as farmers always have good sized families, this would mean at least 200,000 people to produce crops and buy supplies.

There is a certain amount of through traffic passing across the state of Michigan, especially on the lines of the Michigan Central and Grand Trunk. The through traffic which passes over the Pere Marquette between Chicago and trunk line points via the Niagara Frontier shows on the Chicago reports as being about 2 per cent of the total tonnage. North of the line of the Pere Marquette there is very little through business, and that moving via Ludington, Frankfort and Mackinaw City to trunk line points is probably less than 5 per cent of the total business through the city of Chicago.

Some Inequalities

The situation, therefore, comes down to the question of what originates and is consumed in lower Michigan, and on a very large portion of this business the lower Michigan roads, and especially the Pere Marquette and Ann Arbor,

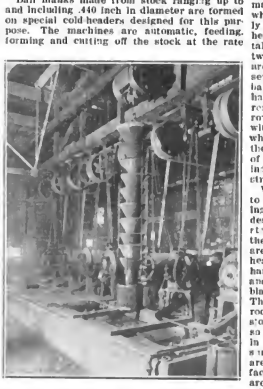
How Steel Balls Are Made

Methods Used in Hoover Plant, at Ann Arbor, One of Michigan's Representative Industries

STEEL BALL MANUFACTURE IN THE HOOVER PLANT AT ANN ARBOR

The photograph at the left shows the cold header department. One of these machines makes 7,500 balls an hour. At the right a workman is shown forging a ball blank.

By HOWARD CAMPBELL



IN RECENT YEARS the application of ball bearings in machine design has increased rapidly. This type of bearing now is used in many machines where plain bearings formerly were considered good enough.

Until German export facilities were shut off by the war, the majority of the steel balls used in these bearings were made by the Deutsche Waffen und Munitions Fabriken, Berlin, and the product of this firm has become so celebrated that many persons think the steel ball industry was developed by the Germans. As a matter of fact, the art of ball making goes back to a very early date. The development of original methods for doing this work is attributed to the Chinese. To those who have credited the Germans with the development of commercial methods of ball manufacture it doubtless will be of interest to learn that the first commercial steel balls were made in this country under basic patents granted to Richardson, of the Waltham Emery Wheel Company, Waltham, Mass., and that the original ball making machinery for the plant of the Deutsche Waffen und Munitions Fabricken was designed and built in the United States and shipped to Germany ready for use.

In 1901 the Standard Roller Bearings Company, Philadelphia, acquired all obsolete and existing plants engaged in the manufacture of steel balls, and in 1906 the late L. J. Hoover left this firm and formed the Grant & Hoover Company, at Merchantville, N. J. On March 1, 1913, the Hoover Steel Ball Company, of Ann Arbor, Mich., was organized by Mr. Hoover for the purpose of engaging in the manufacture of high grade steel balls to take the place of those imported from Germany. When the European war started in 1914, the blockade of German ports by the British navy shut off the supply of steel balls formerly exported by that country to the United States, and the insistent demands of consumers for balls made in this country imposed a heavy strain upon the facilities of domestic producers.

The steel from which balls are made comes to the factory in coils or straight rods, according to its size. Stock less than half an inch in diameter comes in coils and is known as "wire," while all stock exceeding this diameter comes in straight bars. In the Hoover plant at Ann Arbor a well-equipped laboratory is maintained in which chemical and physical tests are conducted on each shipment of steel to determine its suitability for manufacture into balls, and an unloading ticket must be signed by the head of the laboratory before the steel can be taken from the cars to the plant.

Ball blanks made from stock ranging up to and including .440 inch in diameter are formed on special cold headers designed for this purpose. The machines are automatic, feeding, forming and cutting off the stock at the rate of 5,400 half inch balls an hour, or 7,500 of the 3-16 size. It is an interesting fact that the balls are larger than the stock from which they are made, a 1-4-inch ball being made from .190 inch diameter stock, and so forth.

Rotary furnaces in which the balls are heated. The spiral quenching apparatus has been pulled up out of the quenching tank.

Blanks for balls exceeding 5-8 inch in diameter are hot forged from straight bars. In handling this work multiple dies are employed which produce strings containing up to ten balls, according to the size. The stock is heated in furnaces, burning crude oil mixed with air under pressure. The temperature is maintained at 1,800 degrees F. or a little above, which provides for heating the stock as rapidly as necessary without burning it. When heated to the proper temperature, the bar is taken from the furnace and the end held between the dies of a hammer, where the balls are formed on the end of the die without severing the metal. In order to produce round balls in such dies, the bar is turned while the hammer is striking a number of blows, which results in forming the balls approximately round. Along one side of the die is a pipe with a number of holes drilled in it, through which water flows on to the dies to keep them cool. After being forged, the hot string of balls is taken to a punch press, where the individual ball blanks are sheared from the string and the superfluous metal removed.

While balls ranging in size from 5-8 inch to 2-1-2 inches in diameter are made by forging strings of blanks in the manner just described, the larger sizes are made by forging single blanks, making one blank at a time at the end of the bar. Bars of the proper size are placed in the furnace, where they are heated to a forging temperature. Then the hammer man places a bar under the hammer and forges a section of it into a string of ball blanks, each one being cut off as it is formed. The blanks are now sent to the dry-grinding room, where the major portion of the excess stock is removed. A dry-grinding machine is so constructed that a circle of balls is held in contact with a grinding wheel under pressure, so that as the wheel revolves the balls are rotated, bringing every part of the surface of the ball to the wheel. These machines are driven at the number of revolutions per minute required to give a surface speed of 4,500 to 5,000 feet per minute at the point where the grinding wheel engages the balls. Three large blowers gather the dust from the

Digitized by Google

At the left is shown the oil grinding department of the Hoover Steel Ball Company's plant. These oil grinders grind the balls smooth and round. At the right are the tumbling barrels, in which the balls are mixed with oil and lime and rolled to give them a polish.

machines by means of a system of pipes which extend to every machine, and convey it to dust collectors.

The balls are first rough dry ground and then finished in the same manner, except that in the finishing operation a finer abrasive wheel is used, which results in giving the balls a smoother surface while reducing their diameters a little closer to the ultimate size.

After the balls have been through the finish dry-grinding operation they are quite round, but the surface is covered with small scratches left by the grinding wheel and there is still a certain amount of excess metal to be removed.

Subsequent to the rough grinding operation, the balls are given a preliminary annealing in rotary gas furnaces, after which they are heat treated in the same type of furnace. In order to insure a uniform quality of product, the balls are fed from a hopper into a spiral which conducts them through the furnace and discharges them, when heated to the proper temperature, into a quenching bath which may be oil, brine or water, according to the size of the ball.

The fifteen rotary furnaces which comprise the production equipment of the Hoover heat treating department have a combined capacity ranging from 1,000 to 1,500 pounds of metal per hour and are so constructed that they deliver a definite quantity of balls of a definite size per unit of time. This fact is an important contribution toward continuous process and uniformity of product.

Every step in the process is controlled by a comprehensive potentiometer system, which includes not only a battery of eight multiple recording pyrometers, but a detached electric signalling board in plain view of every furnace operator at all times. This dual system not only permits the technician in charge of the pyrometer room continually to check the temperatures of each individual furnace, but enables the operator to tell at a glance whether his furnace is maintaining the predetermined temperature. The stylographic record of each heat is permanently filed so that future reference will reveal the complete hardening process to which each lot of balls was subjected.

Experience has proved that the Hoover spiral quenching bath does away with quenching defects arising out of the commonly used straightline bath. This apparatus consists of a metal spiral along which the balls travel before reaching the bottom of the tank, which is fifteen feet deep. The purpose of this is to distribute the balls and deflect their course so that they follow a winding path and are completely cooled before reaching the receptacle submerged at the bottom of the tank. The contents of the bath are kept in constant circulation to prevent their becoming overheated.

In hardening, the method differs according to the size of the balls, those of 5-16 inch diameter and less being quenched in water or brine. When a basket is filled, it is lifted out of the tank by means of an electric hoist and the balls removed. The rotary furnaces are used for hardening all sizes of balls.

During the process of hardening, internal strains are set up in the balls, and it is now necessary to relieve these strains without affecting the surface hardness. This is done by seasoning the balls in boiling water. The difference in crushing strength of the balls before and after seasoning is considerable. At the same time, the heat absorbed during this process dries the balls so quickly that surface oxidation does not take place.

At this stage, samples from every lot of balls are examined by the laboratory, where the crushing strength and surface hardness are determined and the fracture examined. If these results are satisfactory, the balls are released; if not, then the lot from which the samples were taken is held up until thorough tests have been made.

As the raw stock passes into production it is apportioned into lots, each lot of balls being given a number, which makes it easy to determine the source of any defect which might become apparent to the inspectors at any stage of manufacture. Throughout the entire manufacturing process, the shop interdepartment inspection exerts its influence and authority to prevent the finishing of defective material. The balls are examined between each stage of production, so that no time may be wasted on poor stock.

After the balls are released by the laboratory they are sent to the oil-grinding department, where they are put into tumbling barrels with a quantity of oil and abrasive and the barrels set in motion. As the barrels revolve, the rolling action of the balls in combination with the abrasive soon accomplishes the desired result. They are then passed through a machine which cleans them by the use of sawdust, after which they go to the "Hoffman" machines.

This is a machine which grinds the balls uniform to a given dimension in quantities,

(*Continued on Page 34*)

The photo at the left shows a corner of the Hoover inspection departm ent. Variations of one-ten-thousandth part of an inch can be easily seen by using the fluid gauge. At the right, part of the laboratory is shown. This machine tests the amount of weight necessary to fracture a ball.

Why the North Dakota Failures

How Townley Played Ducks and Drakes With Sound Banking Practice, and the Part the Farmers Took

By PHIL S. HANNA

WHEN WE HEAR the word "soviet," the natural mental picture is of Russia, but we have had and continue to have in a lessened degree, right in one of these United States, a dangerous little soviet scheme in actual operation. It is doubtful whether the people of North Dakota noticed with the Townleyites realize the degree of radicalism which has been foisted upon their state, for the wave of sentiment grew up slowly and in the beginning nearly all the people of the state were cemented together in the common cause of eliminating the middle man, which, they believed, would mean a bigger portion of the consumers' money for the producer. It got to be a passion with many to rant about the "grain gamblers" and "five stock price manipulators" long before Townley came on the scene, and being a state 90 per cent agricultural, there never has been in balancing factor such as there is in states like Illinois and Michigan, with their city voting power and difference of viewpoint.

There is strong testimony, however, that certain evils of which the farmers complained should have been and might have been corrected by the political party then in power, but nothing was done, notwithstanding repeated appeals by the farmers, mainly for more rural capital. Under the constitution of the state, if twice voted upon favorably, an amendment to permit the commonwealth to engage in business could be added. Such an amendment was added, first by a 62 per cent vote in favor of it and by an 80 per cent favorable vote the second time. The result was that at the next session of the legislature a bill appropriating $200,000 to carry out the implied wishes of the people was presented, and in one of the committee hearings on the measure an unfortunate event occurred at the agricultural department. A senator who was opposed to the bill got excited and told a delegation of farmers who had come to Bismarck to voice their approval to "go home and stop their hogs," and then and there, as it is said ahont the cowboy and his wife, "the fight was on."

The stage was beautifully set for the events which followed. Townley happened to be in North Dakota and he took the cue at once. "He just fell into it," says J. J. Earley, president of the North Dakota Bankers' Association. "He called together a few of his friends—he was enrolled as a Socialist and had been doing a little work in the western part of the state in behalf of socialism—and developed a plan for the organization and called it the Non-Partisan League." The success which attended his efforts is too well known to call for further elnboration here, but for the purposes of this article it is well to call attention to the fact that subsequently the League added to its title the word "National," and as events have shown since, the ambition is to make the League national in its power and influence. Well, the leaguers, as you have so often read, got control of the government from the supreme court down and passed the industrial acts which had been so long promised. But those acts made state enterprises took money and lots of it; so that it was necessary early in the game to provide a source of funds, and this was done by creating the Bank of North Dakota.

The law creating this institution, which, by the way, many of the farmers think is something like a Federal Reserve Bank, provides that the capital shall be $2,000,000 of state bonds, not $2,000,000 of money. The intention was to sell the bonds outside of the state, so as to avoid levying taxes, for it was one of the promises of the Leagners to the farmers that all the changes would be brought about without increasing taxes and by assessing the costs thereof against the consumer and speculator in food products. But the bonds would not sell and in fact have not since been sold, except that a loan of $1,000,000 was obtained from a Chicago bank with $1,200,000 of bonds as collateral. And thus the public funds of the state, counties, townships and school districts formed the chief source of working capital for the bank and the deposit of such funds was required by law. The state banks and nationnl lnnks were not compelled to deposit their reserves in the Bank of North Dakota, but if any bank failed to keep a deposit with it, such bank failed to receive a redeposit of public funds. Hence it became good business to keep an account with the Bank of North Dakota, the method of persuasion being gentle and indirect but of deadly effect to the banker who tried to hold back.

The Question of Interest

Now right here comes up the question of interest paid on deposits, and while the scheme adopted by the great Moses and his followers did not bring forth immediate complaint, the scheme has proved since to have been one of the first thorns in the flesh of the farmer, for it reduced the interest on the public funds about one per cent. The banks therefore have commonly been paying three per cent on public funds, but under the new scheme the Bank of North Dakota paid the political subdivision two per cent and collected four per cent from the bank with which the funds were redeposited. This gave the Bank of North Dakota a two per cent margin on all the funds which passed through its hands, cost the banker one per cent more and gave the municipal treasury one per cent less. And in popular language the arrangement "got hy" nicely for a time, for all minds were engrossed in the dissemination of the many financial benefits which had been promised which for a time began to flow out from the new institution.

In last week's issue of this paper was given a statement of the Bank of North Dakota as of January 16, 1921, where it may be noted that the total of deposits due to political subdivisions of the state was $12,453,666, of which items only $6,204,526 had been redeposited with 793 banks in the state, leaving $6,229,140 which might normally be termed lonnahle funds, but notice that four principal items among the assets more than mnke up the latter total: Bonds, U. S., state and county $1,962,756; loans to banks $2,607,418; loands to public bodies, $993,350; loans on real estate, $2,885,864, or a total of $8,449,368. The statement is repented here for convenience.

RESOURCES	
Bonds, United States, state and county	$1,962,756.25
Loans to banks	2,607,418.02
Loans on warehouse receipts	94,001.14
Loans to public bodies	993,350.93
Loans on real estate	2,885,864.57
Interest earned, uncorrected	282,752.85
Furniture and fixtures	52,002.26
Due from 793 banks in state	6,204,526.67
Due from banks outside state	60,476.97
Cash items due from banks	282,667.27
Cash items due from correspondents	106,161.88
Cash on hand and cash items	23,276.37
Total resources	$15,926,725.24

LIABILITIES	
Capital	$2,000,000.00
Surplus	40,000.00
Reserve to repay appropriations	24,103.17
Reserve for depreciation	9,860.66
Net profits for 1920	121,883.17
Net profits for 1919 to date	4,237.77
Appraisal fees	5,713.43
Individual deposits	226,039.10
Public deposits, sinking funds	3,678,756.10
Public deposits state treasurer	2,389,184.54
Public deposits (county, school, etc.)	4,849,896.32
Due to banks (reserves)	958,550.00
Collection items	59,195.12
Bills payable	1,000,000.00
Total liabilities	$15,926,725.24

Now the point to emphasize nalde from the very apparent unsound condition which the statement shows, is that the bank was enabled in the beginning to use surplus funds generously in support of the state industries, but that the effect of the scheme in regard to liability in this direction is constantly diminishing; and it is just in this failure to keep up unnatural benefits to favored institutions without resorting to issues that has been to spell the failure of the Townley scheme.

For example, the sinking fund deposits, $3,678,756, January 16, provided good capital, while bonds it was created to retire were not due but some are coming due and the state must use the funds before long. The county and school money provided good capital until it was needed, and unless the counties and school districts tax themselves in order specially to provide deposits for the Bank of North Dakota, that fund must be used, and the same is true of funds accredited to the state treasurer. But hear ye how the cunning Moses and his cohorts have in a measure got around paying back deposits. It is said authoritatively that when the municipal light plant at Bench, N. D., gave checks on the Bank of North Dakota to its employes for wages, the bank simply refused to pay the checks. Very simple and very effective and of course kept the funds in Fargo. Warrants issued to the farmers for hail losses were supposed to be covered by taxes raised by the state and deposited in the Bank of North Dakota, but when the warrants were presented for payment, the holders simply were advised that payment would not be made for the time being. And if one had time he could gather plenty of testimony of many such devices resorted to by the Bank of North Dakota in order to hold on to its capital, i. e., the people's money raised for other purposes. Meanwhile

U. S. Rubber Co. Profit For 1920 Is $21,275,524

The United States Rubber Company in its preliminary report for 1920 states that total assets at the end of December were $389,245,980, as compared with $319,534,204 in 1919 and $262,891,450 in 1918.

Net profits for the year were $21,275,524, on total sales of $255,744,685, while the net the year before was $17,730,237 on business of $255,589,465. In 1918 net profits amounted to $16,072,042 on $215,398,425 of sales. The profit for 1920 was equivalent to $19.82 a share on the common stock, as against $17.59 in 1919, the common for the year totaling $81,000,000, as compared with $72,000,000 in 1919.

After taking into account dividends, previous surplus, and other items, the net profits and loss surplus at the end of 1920 was $53,347,227, as compared with $52,310,163 in 1919 and 41,848,051 in 1918.

hail warrants are changing hands at discounts ranging from 5 to 25 per cent and it is not to be wondered that Townley has suddenly found plenty of time to change his scene of operations to Nebraska.

The Farmer's Bank Deal

Bankers will be interested in the generous way in which the League organizers obtained a "farmer's bank" for the farmers living around Valley City, N. D. The scheme is not exclusive but mainly co-operative in that the smooth gentlemen co-operated with the farmers in obtaining a bank for them. The story was told by a Valley City banker about as follows: The organizers got the farmers together and sustained subscriptions for capital to the American Exchange Bank with a capital of $200,000, the majority of which was paid in notes. Thereupon they went to James Grady and H. C. Aamoth, who were holding control of the American National Bank, and purchased this institution for $375 a share. Later the minority interests were bought out at around $200 a share. The national bank charter was given up and the bank reopened under state charter, with the farmers in full control. Shortly afterward the League gentlemen who did the organizing effected an increase in the value of banking house of $20,000 and also effected a charge of $20,000 to expense or otherwise, and walked off with $40,000 for their services to the farmers in organizing the bank. The deal was so raw that for decency's sake Attorney General Langer made them put back $20,000, but the other $20,000 never was returned to the stockholders. Langer, it may be noted, shortly afterward was deposed because Governor Frazier "didn't have confidence in him." Now it is said that the capital is to be reduced to $100,000 and it may be presumed that a like amount of notes will be returned to the subscribers. The story goes that the entire transaction would have stood had it not been for action by the Comptroller of the Currency.

Again it will no doubt be interesting to Michigan bankers to learn more of the modern way of holding on to deposits. Other banks, doubtless encouraged by the example of the Bank of North Dakota, when put hard for reserve have invented the scheme of receiving but not opening letters which are supposed to contain cash letters. (Cash for which remittance must be made by mail). In one bank I saw a pile of unopened letters and when the cashier was asked why the same were not opened he replied that he thought they contained checks, and to be on the safe side he had deferred opening his mail. Another story is told by the same banker of a bank at Courtenay, N. D., which ran low on reserve and there was strong suspicion in the minds of the directors that the institution was insolvent; so they went to Bismarck to see the state bank examiner (called Commissioner of Banking in Michigan). They are said to have laid their troubles before that official and were advised to go back home and keep on doing business as best they could but to keep the bank open by all means regardless of their fears. This town, by the way, has a population of around 400 and has three banks. Tower City is another place with about 500 population and three banks, but there isn't as much real money in either city in the combined banks as one should have.

In connection with the persistent charges that the Federal Reserve Banks have discriminated against the farmer in favor of business interests, observe this case. A small national bank, not far from Valley City, was especially hurt by outside withdrawals, so that its deposits, which were normally around $150,000, fell off to $47,000 at the end of December. One of the reserve city bankers who had been working all fall to help them out showed the writer a statement which revealed that the Federal Reserve Bank of Minneapolis had lent this bank $80,000, notwithstanding other borrowed money liabilities of about $30,000 which were incurred. And the officials of the Minneapolis Reserve Bank were quoted in Valley City as saying that they would go the limit to help the member banks. In this case they surely did. And for some time to come they probably will be in the retail banking business in North Dakota as a result of their efforts to help the farmer. But what would we say if some bank at Flint for instance had borrowed about twice the amount of its deposits? It shouldn't need much argument to disprove some of the foolish, hastily formed statements made about the Federal Reserve Banks.

The Banker Holds the Bag

Now these instances are not given with the motive of making fun out of the misfortunes of the North Dakota bankers, for it is a sad commentary that out of the mess he will emerge the loser in more ways than one. His credit has been injured, his profits have dwindled and he looks out at the farmers, many of whom he helped to get started when they didn't have a dollar, going by in their automobiles while he is scratching his head for some way to meet his checks and keep his doors open. If there is one reason for the inconsiderate attitude on the part of the Dakota farmer toward his banker it is that credit has been too easy and the banker has been to the farmer like an indulgent father to an only son. How many states are there other than North Dakota where a farmer can buy a piece of land without paying a dollar down? There are hundreds who got their start hecnuse they could buy land on a basis of crop payments—one-half of the first crop to the seller, and the banker taking a mortgage on the buyer's half as security for funds advanced for seed and machinery. Meanwhile a good reputation for honesty brought the struggling farmer credit at the general store and credit for his implements; the basis of

Something New in Steam Engines

A STEAM ENGINE, said to be of almost limitless utility and embodying many new applications of old mechanical principles in a manner so novel that at first glance the expert would declare it impracticable, is the product of a Detroit inventor, E. U. G. Reagan, whose success in developing the machine is due largely to the backing of a combination of Detroit and Pittsburgh capital.

The engine is an eight-cylinder, reciprocating type machine, weighing approximately 160 pounds, which is less than the weight of the transmission of an ordinary five-ton truck, and developing 72.8 brake horsepower. In outward appearance it somewhat resembles a truck transmission, as may be seen by the accompanying illustrations. It is 12 inches high, 15 inches long over all and 11 inches long over the heads and cylinders. Mr. Reagan says it is practicable for automotive, marine and a variety of other uses.

The engine has no base, no crankcase, no crankshaft, no connecting rods and no flywheel. It is assembled without packing or gaskets of any kind. It has only eight bolts, and not a single bolt or screw in any moving part. It operates both forward and reverse at the same speeds with only two rotating valves. It has the same power, directly connected, from the starting point up to 600 revolutions per minute. It has a one-lever control, which starts it and stops it, all speeds forward, neutral and reverse.

A unique feature is the fact that, owing to the method of control and the fact that the power may be applied by direct transmission, the steam pressure in the cylinders may be

THE NEW REAGAN STEAM ENGINE

used as a brake, depending upon the position of the control lever.

The cylinder dimensions are 2½-inch bore by 2½-inch stroke. Just as in any other steam engine, the power varies in proportion to the cylinder dimensions. The engine may be constructed of any desired size, with any even number of cylinders. A sight-feed steam lubricator system is used.

Power from the pistons is transmitted to the driving shaft through a flexible power ring, somewhat on the same principle that a worm gear operates, or as the strength and weight of an animal is applied through a treadmill. The power ring encircles the shaft and acts upon bearings affixed to the shaft on either side. Friction is reduced by the use of ball bearings.

The power ring is actuated by trunions which fit into the notches provided in the cylinders, which encircle the power ring. Each trunion has a brass ball on its end to reduce friction as it works through its slot, and is fixed to the power ring so that the head may move in any direction through an arc of approximately three degrees. Thus they are permitted to assume the position whereby power may be applied by the pistons to the best advantage and at the same time without applying any end thrust on account of the position of the trunions to the roller bearings on the shaft.

Steam is admitted to the cylinders through the rotating valves at either end of the engine. The intakes and exhausts are so arranged that two opposite cylinders are idle at any one moment, while the two series of three cylinders are working in opposite directions. Thus end thrust on the roller bearings on the shaft is eliminated.

The fact that this engine in effect is two separate engines makes it possible, the inventor says, to use it as an air compressor, one end being used for steam and the other as a pump.

In conjunction with the engine Mr. Reagan has developed a new type of steam generator, which he believes solves many, if not all, the difficulties that hitherto have attended the use of this device.

The boiler is built of units, whereby any one or more units may be removed without dis-

Several Business Bills Are Before the Legislature

During the last and present week the Legislature has been flooded with bills, has proposed and started investigations of various kinds, talked capital punishment and taken further steps in the reorganization of the state government.

A resolution asking Congress to restore to the states the control of all railroads within the states has been passed by the House and is before the Senate.

The cost-plus system of letting contracts for public work by the state, counties, municipalities and townships is under discussion, with a bill before the upper house to prevent contracts being awarded under such a system. Among the other bills on the calendar are those prohibiting contractors on state or municipal work from employing any person who has not resided within the state one year; taxing of mining companies only on all buildings above ground at their actual value and on ore mines during the year, instead of on shafts and estimated value of property underground; repeal of the 1919 railroad rate statutes; limiting of money lenders to a rate of 3½ per cent, regardless of the amount lent; providing eight-hour day for labor in all mines, quarries, workshops, factories and manufacturing concerns in the state, with time and a half for overtime; preventing employers from exercising police power over their employes and prohibiting the taking of finger prints or photographs of employes; raising the mill tax for support of University of Michigan from one-half to five-eighths of a mill; compelling all insurance companies to pay the full face value of policies where the loss equaled or exceeded the insurance, and placing all auditing in the hands of state auditor.

During the present week a conference was held to consider an annual tax on Michigan corporations organized and operating for profit and on foreign corporations entering this state, the money to go into the coffers of the state. At present the filing fees for incorporating based on the capital stock and paid to the state department are about the only general corporation tax.

An effort to make the taxation of shipping docks owned and operated by railroad lines of the state a local proposition, instead of regarding them as other railroad property which is absolved from local tax but comes under state tax levy, is proposed.

FORD CUTS SOCIAL SERVICE

In connection with the recent resignation of Dr. Samuel S. Marquis as head of the sociological department of the Ford Motor Company, Detroit, the company has let it be known that the work hereafter will be conducted on a smaller scale. Dr. J. E. Mead, one of the executives of the department, did the talking.

"There will be no change of policy," Dr. Mead said, "and it is not true that the Ford Motor Company has decided to abolish its sociological department. The reason for the decision to conduct it on a smaller scale is that this department is to be consolidated with several others.

Dr. Mead said that as far as he knew the force would not be reduced, but that the workers would not cover the project in as great detail as has been done in the past.

In time of greatest activity the sociological department had a force of 130 workers.

MOONEY MANAGES BUILDERS' SHOW

C. H. Mooney, formerly manager of the Fort street-Military avenue branch of the Commonwealth-Federal Savings Bank, Detroit, has been made business manager of the Third Annual Builders' Show, to be held in the Armory, March 19 to 27.

Simplicity in Management

The Fine Art of Business

"... in all things the supreme Excellence is Simplicity"

Efficiency is the result of intelligent simplicity.

To relieve management of needless and wasteful effort in the control of production and cost, and to simplify the direction of all important activities, office as well as factory, work must be carefully planned and the plan persistently worked.

All competent plans are based on reliable figures. The deduction of *facts from figures* and the practical, timely and systematic application of those *facts* to individual needs is management simplified—the Fine Art of Business.

This lack of simplicity is the weakness we have noted most in our many years of personal audits and system service in practically every field of industry. And always this lack of simplicity is due to the lack of *a competent plan persistently worked.*

We have just issued a small booklet on this most interesting subject, Simplicity in Management. It outlines the need of simple, straight-line methods in the control and direction of business. It shows briefly the practical, time and labor saving value of plans based on competent facts and figures. It is a hand book to the Fine Art of Business.

Sent to executives or managers on request.

Jaxon's New Power Plant

Some Construction Details of $250,000 Building Installation Now Nearing Completion in Jackson

THE Jaxon Steel Products Company, Jackson, has a central power plant under construction which, when completed, will be one of the industrial show places of the city. The plant is being built by the du Pont Engineering Company, a subsidiary of E. I. du Pont de Nemours Company, Wilmington, Del. The Jaxon Steel Products Company is a part of the General Motors Corporation, which is controlled by the du Pont interests. The plant under construction will be 82 by 40 feet in size and 50 feet high. Work was started last August.

The lay-out was made with a cost estimate of $250,000. The building is of sand-lime brick, and the north and south walls have been made of corrugated iron to permit of future expansion. There are two units of water tube boilers, each rated at 354 horsepower, but capable of developing 1,500 horsepower. Both are equipped with soot blowers and two combustion E type automatic stokers, which are fed from an overhead hopper with a capacity of 45 tons of coal, sufficient for operating the plant 16 hours. The hopper is fed by a coal handling apparatus, made of structural steel, and a monorail system is used to operate an electrically driven traveling crane with a bucket, holding three quarters of a ton at one time. The same apparatus handles the ashes.

A blower used to provide a forced draft for the stokers connects with the boilers and is driven by a horizontal steam engine. The fans make 584 revolutions per minute. The stokers are regulated automatically. The oiling system also is automatic and the supply of water is controlled by two water feed pumps. The water is run through a water feed heater, heated to 200 degrees, and then accurately measured. An attachment of the stokers measures the coal used and thus permits an accurate check on efficiency.

The smokestack has a foundation 30 feet 6 inches in diameter, and sets 70 feet in the ground. At the base the stack is 18 feet, 4 inches in diameter, while at the top the diameter is 9 feet, internal measurement. The deadweight of the stack is 537 tons and it is guaranteed to withstand wind pressure up to 100 miles an hour.

There is a 500 k. w., three phase, 4,800 volt, 60 cycle turbine as part of the electrical equipment. The generator efficiency of the turbine at its full load is 94 per cent. The buss wall is of concrete and is equipped with copper buss, disconnecting switches, current transformers and oil switches. The latter are controlled from the switchboard, which is at the front of the buss wall. The switchboard has mounted on it, meters, measuring devices and switch control levers. All the underground wires leading to the main plant are lead-covered, laid in a fibre conduit, which in turn is encased in a slab of concrete and buried five feet in the ground.

In the construction of the plant the du Pont Engineering Company has followed its policy of purchasing as much of the materials as possible in the town where the work is being done, and thus it is said that most of the $250,000 which this power plant cost will have been expended in Jackson.

The Jaxon Steel Products Company is expected considerably to increase its manufacturing activities and its new power plant is part of the program.

$8,272,211 Expended On Lincoln Highway in 1920

In checking accomplishments at the end of 1920, officials of the Lincoln Highway Association express themselves as highly pleased with the progress made in the improvement of the transcontinental route during the year. Each state traversed by the highway from the Atlantic to the Pacific has done all that it was physically able to accomplish during the year. Nowhere did lack of money hamper the work.

As a result, 548 miles of actual improvement have been added to the thoroughfare. That is 16 per cent of the total length of the road. The money spent in bringing about this construction fell but little short of the total expended in 1919, which represented the high point in cash investment on the Lincoln Way in any one year.

Had it not been for physical handicaps, such as the lack of transportation facilities and building materials, the high price and prevalent shortage of labor, the condition of the securities market affecting the sale of bonds for road building, and the reluctance on the part of reputable contractors to undertake road work in consequence, it is an assured fact that 1920 would have seen a greater outlay for building the Lincoln Way than any year in the past. Much of the work contemplated for 1920 has of necessity been carried over into 1921, and accordingly the Lincoln Highway Association is expecting a new year of splendid results.

The work for the year is given in the following table:

State	Mileage	New construction	Maintenance
New Jersey	14.0	$ 852,000	$105,352
Pennsylvania	22.0	1,162,000	500,000
Ohio	19.5	507,612	.....
Indiana	10.0	294,746	.....
Illinois	51.0	2,180,000	.....
Iowa	21.0	571,845	71,700
Wyoming	237.5	493,200	37,136
Nebraska	29.0	527,822	.....
Utah (est.)	16.5	144,000	16,000
Nevada	65.0	745,845	7,867
California	2.5	51,321	63,836
Total	529	$7,470,490	$801,721

Total expenditures upon the Lincoln Highway in 1920, $8,272,211.

The progress made in bringing the Lincoln Highway from a dream in the minds of its founders, seven years back, to its present status, is summarized in the following table of yearly expenditures:

1914	$1,200,000
1915	2,580,380
1916	4,580,105
War (1917	2,500,918
(1918	2,996,107
1919	9,386,400
1920	8,324,624
Total	$31,569,094

Michigan Fire Losses in Five Years $43,767,928

THE National Board of Fire Underwriters through its Actuarial Bureau has just completed a five-year analysis of fire losses in Michigan. These figures, now for the first time made public, reveal the price which is paid by the state for public ignorance or carelessness in the matter of fire hazard. They are drawn from an exhaustive study of approximately 57,000 different fires actually reported upon by the insurance companies, and to the figures presented it is estimated that 25 per cent should be added to cover fires not reported to the Actuarial Bureau.

The causes are classified into three groups, of which twelve are listed as strictly preventable, with a total of $15,487,857, or 35.4 per cent of the whole; nine are designated partly preventable and total $18,683,374, or 42.7 of the whole, and beyond these are the unknown causes totalling $9,596,697, or 21.9 per cent. These unknown causes may be considered as probably largely preventable, since, if known, they would be distributed among the other causes.

Examining more closely, one finds that while exposure, meaning the spread of fires already started, takes the lead with a total loss of $5,255,973, the largest original cause of fire is that of electricity, with its toll of $4,573,567. Next after electricity the most destructive fire cause was stoves, furnaces, boilers and their pipes, $3,408,753; followed by defective chimneys and flues, $2,618,903 and spontaneous combustion, $2,600,206.

The complete table of five years' totals and yearly averages by causes is as follows:

Strictly Preventable Causes:	
Defective chimneys and flues	$2,618,902
Fireworks, firecrackers, etc.	61,266
Gas, natural and artificial	176,574
Hot ashes and coal, open fires	417,306
Ignition of hot grease, oil, tar, wax, asphalt, etc.	271,202
Matches and smoking	2,557,907
Open lights	2,480,819
Petroleum and its products	1,240,824
Rubbish and litter	102,949
Sparks on roofs	2,070,399
Steam and hot water pipes	60,155
Stoves, furnaces, boilers and their pipes	3,408,753
Total	$15,487,857

Note: In each of the above cases, preliminary inspection would have shown the element of danger, which then might have been easily remedied.

Partly Preventable Causes:	
Electricity	$4,573,567
Explosions	915,402
Exposure (including conflagrations)	5,255,973
Sparks from machinery	1,853,744
Incendiarism	1,830,665
Lightning	998,926
Miscellaneous known causes	677,221
Sparks from combustion	781,690
Spontaneous combustion	2,600,206

Note: It is estimated that at least half of the loss occasioned by electricity, sparks from fires, and spontaneous combustion was preventable, and that all the other causes had some degree of preventability.

Unknown causes (probably largely preventable)	$9,596,697.

Michigan stands ninth among all the states in losses from fire, and the totals quoted above should, as stated, be increased by about 25 per cent to cover losses not reported to the National Board of Fire Underwriters. Thus it will be seen that this state during the years 1915 to 1919, incinsive, paid $43,767,928, or a yearly average of $8,753,585 for the indulgence of the costly habit of playing with fire. If the huge five-year total of $43,767,928 could have been used instead of wasted, it would have built 8,750 houses at $5,000 each (sufficient to furnish homes for 43,000 people, or more than the population of Muskegon), or it would build 4,300 miles of good macadam roads at $10,000 a mile.

ST. LAWRENCE ROUTE REVENUE

Addressing the Detroit Engineering Society, at the Board of Commerce, last week, Prof. Gardner S. Williams, of the University of Michigan, said that while the cost of the Great Lakes-St. Lawrence ocean route engineering work would approximate $750,000,000, the sale of water power would bring an annual revenue of 15 per cent on the investment and the revenue from navigation rights would reach 7 per cent a year. Relative to methods of developing the route, Prof. Williams said that either the United States and Canada would unite in constructing it, or long-term franchises could be granted to private corporations. Potential water power available, he said, would release 60,000,000 tons of coal now used in the Great Lakes district, and that water power could be sold for $54 per horsepower per year, a much lower commercial rate than now in force.

HOLMES LUMBER CO. SOLD

The Arthur L. Holmes Lumber Company, Detroit—Gratiot, West Warren and Van Dyke avenue yards included—has been sold to Joseph A. Braun and Fred L. Lowrie. The name will not be changed. Mr. Lowrie is president of the F. L. Lowrie Lumber & Finish Company and Mr. Braun is president of the Braun Lumber Company.

Production :: Sales :: Service :: Financing :: Personnel

NASH'S PRODUCTION SPURT

One of the most talked-of concerns in the automotive industry today is the Nash Motors Company, Kenosha and Milwaukee. Announcement that the company made more than 41,000 vehicles last year—37,263 passenger cars and 3,848 trucks—was not expected in many quarters, and it brings the Nash concern up among the half dozen big producers, of which Ford is the leader, followed by Dodge, Buick, Studebaker and Chevrolet. Overland dropped out of the van last year as a consequence of the strike which interfered with production for several months. Another concern which made an unexpectedly good showing last year was Franklin, which is classed among the first eight or ten largest producers.

STUDEBAKER OPERATIONS

Operations of the Studebaker Corporation, Detroit and South Bend, Ind., are said to be steadily progressing toward a normal basis. During the first three months of this year it is planned to make 12,000 cars and to increase this output probably one-fourth during the next three months, or even doing better if conditions warrant. Studebaker is now in a position where its production can be materially increased at any time, owing to the completion of the new South Bend plant. During the last year the Corporation made approximately 52,000 cars, which is 13,000 more than in 1919.

REPUBLIC RUBBER RESUMES

The Republic Tire Company, Youngstown, O., which had been closed for some time, resumed operations January 31 in its tire departments, also increased mechanical goods production.

SIMPLEX WIRE WHEEL RE-ELECTS

The Simplex Wire Wheel Company, Cadillac, has re-elected the old board of directors and officers: President, J. P. Wilcox; vice-president, W. E. Curry; secretary-treasurer, J. C. Ford. The other directors are J. B. Wagner, W. A. Kyser, C. B. Smith, C. A. Saunders, George J. Sandel and C. F. Williams. The concern moved to Cadillac from Detroit, where it was known as the Kol-Ben Wheel Company.

PRESSED STEEL PLANT ABOUT READY

President W. Ledyard Mitchell, of Maxwell-Chalmers, announces that the company's new pressed steel plant is about ready for manufacturing. The plant covers more than 217,000 feet of floor space and will supply all pressed steel for both cars. The main building contains two craneways each with a double row of presses, 300 feet long and each equipped with a crane capable of picking up any material or even the presses themselves and moving them to any other part of the building.

49,035 OWN GMC STOCK

It is announced that on January 10 stockholders of the General Motors Corporation numbered 49,035, as against 36,884 on October 5, 1920, and 26,136 on April 5, 1920.

ANOTHER NEW CLARK AXLE

Announcement is made that a new motor bus axle of the internal gear type has just been placed in production by the Clark Equipment Company, Buchanan. The first model in production is that for a single deck, 20 to 30-passenger motor bus, to be equipped with solid or pneumatic tires. All models of this bus axle will use standard stock parts. The design provides for a low body with a minimum number of steps, insuring a low center of gravity and providing maximum road stability.

This new Clark product is designed so that a low-hung body may be used without loss in the seating capacity. Added efficiency in bus construction is obtained when a drop frame is used in connection with the Clark axle, permitting the use of underslung springs. The axle is light.

The company announces that while the model of the 25-passenger bus axle has been put into production first, it is prepared to turn out units up to the largest size; in all of which standard stock parts are used as the load carrying member, drive shafts and differential.

GOODYEAR GAINS 50%

Vice-President G. M. Stadleman, of the Goodyear Tire & Rubber Company, Akron, O., has announced that business of the company during January increased more than 50 per cent over December orders and that as soon as the refinancing arrangements of the company have been completed it will be necessary to increase the output more than 100 per cent, or to 18,000 a day.

GOVE SAID TO BE ABOUT READY

From Brighton comes the report that the Gove Motor Car Company expects to have its factory in readiness for production within 30 days and that assembling of the first Gove cars will be started early in March.

MULLINS BODY PROFIT $701,290

The Mullins Body Corporation ended 1920 with a net profit of $701,290 and after deduction of preferred and common dividends, had a surplus of $211,920. Net sales amounted to $3,711,420.

FIRESTONE INVENTORY, $37,273,000

Inventories of the Firestone Tire & Rubber Company, Akron, O., on January 1, 1921, totaled $37,273,873, as compared with $26,369,535 in 1920. Materials on hand, in transit or in process totaled $21,168,140. On January 1, 1920, the amount was $11,217,872. Finished products show only a slight increase, the total this year being $16,105,733, as compared with $15,751,662 last year.

INTERNATIONAL MOTOR TRUCK

The last year was the best in the history of the International Motor Truck Corporation. Seven thousand twenty-five trucks were sold, as compared with 4,604 in 1919 and 3,829 in 1918. Sales of trucks and parts will show a total of about $35,000,000, says the Wall Street Journal, as compared with $22,123,951 in 1919 and $19,641,572 in 1918. "Last August," says the newspaper, "anticipating the falling off in business, the management readjusted its production schedule from approximately 700 trucks to 500 trucks a month. For the first quarter of 1921 the company has again readjusted its production schedule, this time to an amount less than the number of orders which it expects to receive. The volume of orders received has been fairly uniform since September and has averaged 562 a month. Deliveries to customers, since August, have been slightly less than 500 a month."

DURANT STOCK MOVES UP

There has been some comment in automobile trade quarters concerning the upward movement of the stock of Durant Motors. The sub-

Digitized by Google

scription price was $10 a share and the trading a few days ago brought the shares up to 18⅛. The first of the Durant cars are expected to be out next August. Very little has been learned officially as to the company's production plans.

STEWART-WARNER PROFITS

Net profits of the Stewart-Warner Speedometer Corporation, Chicago, for 1920, amounted to $2,728,472 before taxes, as compared with $2,331,915 in 1919.

MICHIGAN COMITTEEMEN

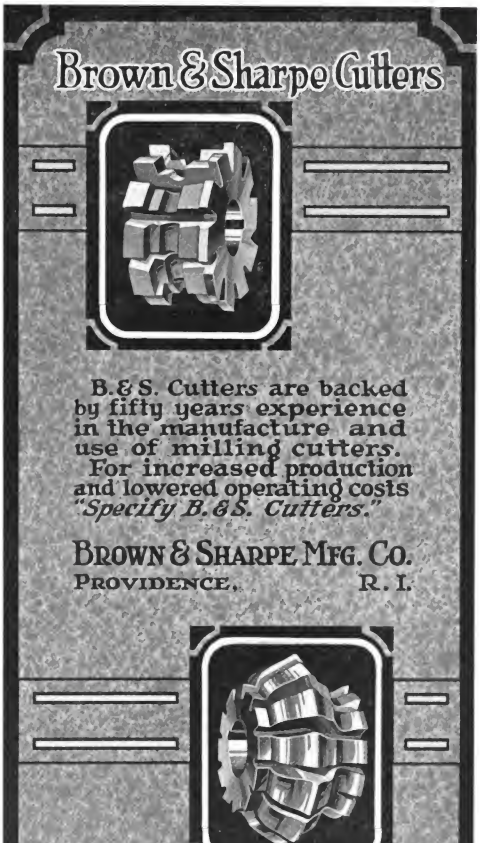
The Motor and Accessory Manufacturers' Association announces that the following Michigan men have been named members of committees: Executive—E. P. Hammond, Gemmer Manufactnring Company, Detroit; A. W. Copland, Detroit Gear & Machine Company, Detroit. Finance—Messrs. Hammond and Copland. Show and alottment—C. H. L. Flintermann, Detroit Pressed Steel Company, Detroit. Banquet—Messrs. Hammond and Flintermann. Membership—A. W. Copland, chairman; G. W. Yeoman, Continental Motors Corporation, Detroit; Fred Glover, Timken-Detroit Axle Company, Detroit.

MOTOR WHEEL MEETING MARCH 1

The annual meeting of the Motor Wheel Corporation, Lansing, will be held in the office of the Prudden unit, March 1, at 2 p. m., for the election of directors. The meeting was postponed from the third Tuesday in February.

MAURICE J. MOORE DIES

Maurice J. Moore, secretary and treasurer of the LaFayette Motors Company, Indianapolis, died February 1 as the result of acute dilation of the heart, following an operation on his knee a week before. He was 35 years old.



Mr. Moore had held the position of secretary and treasurer of the LaFayette Motors Company since the corporation's inception in 1919. He was also president of the LaFayette building Company and was largely responsible for the building of a colony of homes for LaFayette employes near the LaFayette plant. He was formerly connected with the Northway Motor & Manufacturing Company, Detroit, and was at one time comptroller of the Chevrolet Motor Company, Flint. During the war he was disqualified for overseas service by the affected knee, injured in a football game several years ago, but performed an important service as captain in the Motor Transport Corps, in charge of finance, accounting and settlement of claims under the Motor Vehicles Divison.

AUTOMOTIVE EXPORTS INCREASING

According to a report issued by the United States Department of Commerce, there is a steadily increasing market for American motor cars in countries outside of Europe, which will help in stabilizing the industry. In 1919, during a period of 11 months, 14,104 commercial vehicles were sold abroad, of which 3,453 were sold in France. This country was the best customer for American trucks. When France put on the 45 per cent tariff, the number of trucks sold in 1920 was only 135, but, all told, foreign sales of American cars reached $43,168,368, an increase of more than $10,000,000 over the sales of 1919. Great Britain became the best customer. While truck sales in the United Kingdom in 1919 amounted to $811,299, in 1920 the business increased to $7,277,665. Also the United Kingdom bought 20,096 passenger cars, compared with 5,021 in 1919.

NEW DORT SALESROOM OPENED

The new salesroom of the Baker-Fisk-Ifugill Company, 3934 Woodward avenue, Detroit, was formally opened this week and the 1921 Dort models exhibited.

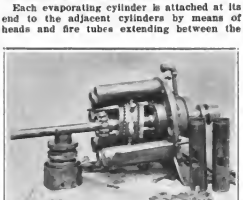
TRANSPORTATION NEWS

Rail :: Commercial Hauling :: Water

Detroit—Boards of commerce of Michigan, Wisconsin, Illinois, Indiana, Ohio and Minnesota have united in a campaign to urge Congress to modify the Seaman's Act so far as it applies to inland waters, and particularly the Great Lakes. A meeting of representatives from states bordering on the lakes was held at the Detroit Board of Commerce, last week. It was decided to have a general meeting in Detroit in April and draw up tentative amendments to the law and then send a delegation of 100 men to Washington to appeal directly to the legislators for a change in the laws. It is contended that the act is driving ships from the Great Lakes or forcing abandonment of many ports of call.

Washington—The New York Central Railroad Company has been authorized by the Interstate Commerce Commission to issue $7,000,000 of refunding and improvement mortgage bonds to be pledged to the director general as security for a demand note for a similar amount for additional improvements during federal control. The bonds are dated April 1 and mature October 1, 2013.



Detroit—General Agent Harris announces the Lehigh Valley freight service has reverted to pre-war schedules and that 24 hours have been clipped from the running time between western cities and New York and Philadelphia. Freight shipped from Detroit will arrive in New York or Philadelphia on the third morning, with similar shortening of delivery time for westbound freight.

Something New in Steam Engines

(*Continued from Page 10*)

turbing the other units and the other units may be used to make steam after one has been removed. The boiler flues consist of 48 pieces of 2½-inch seamless steel tubing, each 24 inches long. This makes the flues 96 feet in total length. Inserted in each fine are 13 steam and water tubes of ½-inch seamless steel tubing, a total of 624 feet, and giving approximately 150 square feet of heating surface.

Each evaporating cylinder is attached at its end to the adjacent cylinders by means of heads and fire tubes extending between the

Reagan engine partially assembled, showing the cylinders with slots, flexible power ring with ball bearings, roller end thrust bearings and one of the two rotating steam valves.

heads. Connecting steam and water mains extend along one end of the boiler near the tops and bottoms of the units, and the units are connected with these mains.

The boiler includes a novel superheater. Connected at one end of the steam main is a conduit, which extends back and forth above the boiler units and then down to the space below the units and back and forth above the burner. Thus the steam is heated to a high temperature.

There is what is claimed to be an exceedingly efficient injector device whereby, when used in motor vehicles, water may be injected automatically into the boiler when the vehicle is going down hill and cut off automatically when the vehicle returns to level or goes up hill.

This consists of a water float and needle valve, which are actuated through connections with the evaporation cylinders and which are connected through a tube with a spring and piston actuated valve which controls the water supply. Thus when the vehicle goes down grade, the needle valve is closed by the change in position of the float, the steam pressure from the evaporation cylinders is cut off, the pressure on the piston of the water supply valve is removed and the spring opens the valve. When the vehicle returns to level or goes up grade an opposite action takes place and the water supply is cut off. When the water gets low in the boiler the injector acts automatically in the same manner.

A perforated plate burner is used with this generator, with a superheater that turns kerosene oil into coal gas. The generator burns about a gallon of oil an hour while in full operation.

The generator has been tested to 900 pounds pressure, cold water test, but carries only 450 pounds working pressure.

Mr. Reagan started work on the development of his engine and generator in April, 1917. The Allied Die Casting Company built the first engine for him and it was tried out at the

INDUSTRIAL BUILDING

Progress, Projects and Contracts of the Week

Lansing—Plans are being made for the erection of the largest store and office building in Lansing, on the site of the American Savings Bank structure, destroyed by fire recently. The Dancer-Brogan Company has closed a 99-year lease with W. K. Prudden for the property, and with the J. W. Bailey Company will put up a building at least 10 stories high. The cost, it is estimated, will be about half a million dollars. A building company will be formed and work will be started early in March, to be completed ready for occupancy about June 1, 1922. The structure will be known as the Prudden building.

Detroit—Two hundred and thirty-five permits were issued during the week ended February 5, involving an expenditure of $763,360, as compared with $934,680 for the preceding week and $1,562,755 for the corresponding week in 1920. While the total for the week was lower, there was an encouraging feature, namely that most all of the money represented was for new construction. There were 154 permits for new work, entailing an expense of $666,565, and 81 permits for repairs and alterations, to cost $96,795.

Adrian—No new buildings were contracted for during January, but four permits were issued for repair and remodeling work, entailing an expenditure of $4,750. This is $3,750 in excess of the amount spent in 1919 and in 1920, when only one building permit was issued during January.

Pontiac—The 34 building permits issued during January involved $34,933, while during December nearly $14,000 more was expended for buildings and repair jobs.

Saginaw—There was a considerable decrease in building operations in the city during January as compared with a year ago, from the monetary standpoint. The number of permits issued was 49, or five more than in January, 1920, but the expenditure involved totaled $25,694, as compared with $52,415. Of the 49 permits, 24 were for garages and 16 for alterations and repairs.

Kalamazoo—During the week ended January 29 five building permits were issued, the expenditure involved being estimated at $12,600. Last winter during the corresponding week a single permit was issued, involving $1,000.

Detroit—Data from the city building department shows that during January 813 permits for new buildings were taken out, as compared with 536 in January, 1920. However, the cost this year is $3,095,964, as compared with $5,093,855 last year. There were also taken out 305 permits for repairs or alterations, involving $885,979, as compared with 150 permits, involving $564,975, a year ago. Thus the money total for January was $3,981,343, as against $5,658,830 in January, 1920.

Jackson—Twenty building permits were issued during January, and mostly for minor work, such as alterations and repairs, the total involved being $14,060.

Adrian—The Andrix Lock-Nut Company will build a plant addition, 50 by 50 feet in dimensions.

Detroit—Among the contracts awarded by architects, according to the announcement of the Detroit Builders and Traders' Exchange, during the week ended February 3, were the following: A two-story store, flat and office building to be erected at Oakman boulevard and Glendale avenue; a one-story bank building for the Merchants and Mechanics Bank, in Hamtramck; a private bank building to be located at Junction and Michigan avenues, and a one-story addition to the Children's Free Hospital. Among the more important projects from offices of architects are the following: A two-story brick residence and garage; a brick and steel 31-family apartment; a two-story stone residence; an eight-steel, eight-apartment building; a two-story brick and steel recreation building; a brick, steel and stone church edifice to be erected in Highland Park; a three-story, brick and steel school, and a brick and steel intermediate school.

Grand Rapids—Permits issued during the week ended January 27 totaled 27 and the expenditure involved $47,850. This is three times as much as the outlay for the corresponding week a year ago. The biggest item in the list is for a $27,000 addition to the factory of the Grand Rapids Chair Company.

New York—The American Contractor states that according to its 1920 compilations of building activities in 194 of the larger cities of the country, 417,287 building permits were taken out and that the expenditure represented was $1,511,489,459, while in 1919 the money spent was $1,428,423,683. The increase was thus 6 per cent.

Jackson—Bids on the new Seymour school building and the addition to the Bennett school will be opened March 17. The school board has approved revised plans for the Seymour building. For this job bids will be asked on the complete work and also on the building with the third floor left unfinished.

PACKARD ADDS 1,000 MEN

Simultaneously with the payment of its regular quarterly preferred dividend to stockholders, Thursday of this week, the Packard Motor Car Company, Detroit, announced that owing to the increase in sales and the improved outlook for spring business, it was adding 1,000 employes immediately.

BUYS TRAINLOAD OF REOS

That the early spring buying season is opening satisfactorily in the automobile trade is indicated by the order for a trainload of automobiles for immediate shipment placed with R. C. Reuschaw, sales manager of the Reo Motor Car Company, by George McFarland, president of the Harrisburg Automobile Company, Harrisburg, Pa., during the Chicago Automobile Show. Mr. McFarland visited the New York Show as usual and ordered his full allotment of Reo passenger cars and Speed Wagons for January, which was shipped him. The buying season opened so vigorously in his territory following the eastern show during the second week of January that he realized the necessity of obtaining increased shipments that he might be prepared for the spring rush. The result was Mr. McFarland's trip to the Chicago show and his trainload order for February shipment.

ROBINSON NEW BANK EXAMINER

E. Robert Robinson, Grand Rapids, formerly a state bank examiner under Commissioner Merrick, has been appointed a national bank examiner attached to the Seventh Federal Reserve District, with headquarters in Chicago. Robinson is well known in Grand Rapids financial circles, having sat one time been connected with the National City Bank, which he left to become an assistant national bank examiner before joining the Michigan force.

Digitized by Google

MR. HATHAWAY CORROBORATED

A reader who took notice of the remarks of P. R. Hathaway, of the Michigan Sugar Company, before the ways and means committee of the House of Representative, as outlined in this paper January 29, writes as follows:

"We wish to say during the last year the Internal Revenue Department at Washington sent us so many requests for duplicate reports on income tax for 1917 and 1918 that it has got to be a regular nuisance. We are evidently not alone in this annoyance, and the sooner the matter is remedied the better it would be for all concerned. It practically takes one-third of our bookkeeper's time to answer these questions."

MICHIGAN BUILDERS ORGANIZE

Builders and contractors of Michigan held a two-day session in Lansing last week to promote closer co-operation. They decided to go ahead this season on the American plan of employment, to endeavor to lower the costs of construction and formed a preliminary organization. In the matter of wages the state will be apportioned into sections, with a minimum scale set for each. A board of governors will be named to select officers and administrators of the association. During the meetings the builders were entertained by the Novo Engine Company and H. G. Christman Company.

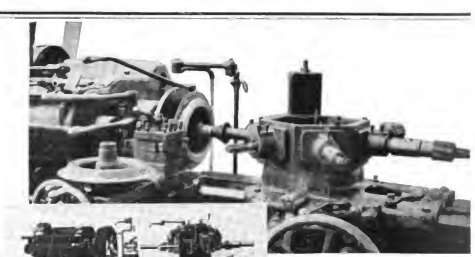
PRODUCTION FOUNDRIES CO.

Although no definite announcement has been made, the Production Foundries Company, Ann Arbor, is expected to resume within a short time. W. O. Adams, plant manager, is quoted as saying that the work at first will consist of filling general orders, and that the output will be considerably increased when resumption of operations at the Ford Motor Company's tractor plant takes place, for the company has orders on hand from the Ford plant. It is expected that within the next few weeks production of the Ann Arbor concern will have progressed to about 50 per cent of normal. When operating normally the plant employs about 150 men.

U. OF M. HIGHWAY CONFERENCE

Under the auspices of the permanent committee on highways and highway transportation education of the University of Michigan, and the state highway department, a mid-western conference on these subjects will be held at Ann Arbor, February 23.

Included the speakers are: Dr. P. P. Claxton, United States commissioner of education; Prof. C. J. Tilden, Yale University; Roy D. Chapin, Detroit; Harriet E. Beard, Detroit; Thomas MacDonald, chief of the United States Bureau of Public Roads; Col. Mason Patrick, corps of engineers, United States Army; Charles Bennett, Connecticut state highway commissioner; Thomas Snyder, secretary Indiana Highway Transport and Terminal Association; A. R. Kroh, Goodyear Tire & Rubber Company, Akron, Ohio, and William C. Reefield, former Secretary of Commerce.



Among the faculty of Michigan on the program will be President M. L. Burton, Dean M. E. Cooley, Prof. H. E. Riggs and Prof. Arthur Blanchard.

NEW LANSING CO. FACILITIES

The new warehouse and sales office of the Chicago branch of the Lansing Company, Lansing, have been fully established at 1535-1537 State street. J. Fred Schultz, formerly of Lansing, is manager of the branch. The warehouse is 50 by 150 feet, four stories and a basement.

GLOBE CASKET ELECTION

The Globe Casket Company, Kalamazoo, has elected George E. Bardeen, president; Woodbury Ransom, vice-president; H. E. White, secretary and general manager, and Charles A. Peck, treasurer.

A Malleable Iron Pressure Ring (12¾" diam.) for a Tractor finished on a W. & S. No. 2-A. The tools on the two turrets are the entire equipment necessary for completing both chuckings.

Be Ready for Increasing Business

Remember there are no obligations attached to the engineering services we offer you. If we cannot help you we tell you so. But—we have helped others to increase the earning capacity of their turret lathe equipments and are ready to try to help you if you wish.

We've had forty years experience making and tooling turret lathes to satisfy unusual demands. Draw on our experience and be ready for the business increases which are bound to come soon.

Write us and we'll send an engineer to consult with you, or send us blueprints and samples of your work for estimate.

EDITORIAL

DETROIT, SATURDAY, FEBRUARY 12, 1921

The Proposed Corporation Tax

THE GOVERNOR of the state is credited with the proposal that a new source of revenue shall be found for the purpose of meeting the rapidly increasing demand for money by the state government. The form which this new levy shall take is a tax on corporations. The particular species of tax is not definitely stated by those who have given out the program, but the indications are that it is to be a corporation profits tax, from the amount which it is proposed to levy and the graduations which are described as a part of its operation. The only definite thing which has been put out about the measure is the deception of the public which has been practiced by the newspapers, whether wittingly or ignorantly, as to the present tax-paying status of the corporations of the state. From what has emanated from Lansing, the average uninformed citizen—and the average citizen is uninformed—would be led to believe that corporations pay no taxes at all nowadays. An insignificant figure of their contributions to the state treasury has been published, this amount being probably the aggregate of franchise fees paid by the corporations of the state upon the filing of their articles of incorporation.

As a matter of fact, corporations of this state pay taxes on all their real and personal property, on an assessment more nearly approaching their true cash value than any other taxpayers. Their annual reports contain statements of their property holdings which are made on the theory of putting their best foot forward. These reports are made, first of all, to comply with the law, and, secondly, for credit purposes. Under the circumstances, the highest property values carried on books are reported. Forthwith these reports are conned by the assessing officers of the larger cities, where the greater number of the corporations are taxpayers, and used as a basis of local assessment. How many corporation officers seeking relief from what they consider overassessment of the corporate properties, are confounded with their own sworn statements taken from the annual reports!

In addition to paying taxes to the state and its various municipal subdivisions, the corporations of Michigan pay an enormous sum to the federal treasury for income taxes. In 1919, the latest year for which complete figures have been compiled, 5,951 corporations in Michigan paid corporation and excess profits taxes aggregating $143,175,293 on incomes earned in 1918. The figures for 1920 were very much larger, according to the casual reports which were made from time to time by the internal revenue collectors. It may be interesting to note that the income taxes of corporations in Michigan for 1918 were 42.5 per cent of their net incomes, while, under the peculiar operation of the federal tax law, private incomes aggregating $415,313,164 produced but $22,336,385 of taxes, or about 5.5 per cent of their total. Thus the discrimination shown by the operations of the federal revenue laws against corporation income and in favor of that realized by individuals and made subject to taxation under the law is very great. The earnings of capital invested in corporations are made to produce nearly eight times as much as similar income from investments and operations of individuals.

When some years ago Gov. Osborn proposed a corporate excess tax law, the same process of discrimination was its informing feature. A corporation, having a given capital, doing a given business and producing a given net revenue, would have been taxed heavily under that proposed measure, while an individual non-corporate owner, employing the same amount of capital, doing the identical amount of business and realizing an equal net profit, would go scot-free of the proposed discriminatory corporate tax.

It cannot be held that such a procedure would effect a heavier levy of taxes upon the wealthier citizens of the state. The corporation, as a rule, has a capital that is provided by a large number of shareholders of more or less uniformly small means, while the individually-held property must of necessity be the possession of capitalists of large wealth.

Michigan stands sixth today in industry as compared with its sisters states of the Union, or at least she did so stand prior to the present cessation of industrial activity. The favorite method of industrial development has been through assemblages of capital in corporate form. If further discriminations in taxation are to be made against the corporate industrial operator, it cannot be very long until investments made in that form must become unpopular and the supply of capital available for industry under the protection of corporate limitations of liability must shrink. This consequence would be harmful to the growth of industry, and the future growth of Michigan depends on the extension of industry. We have already heard enough from the captains of industry in the country about the evil results of the continuance of a discriminating tax system, devised for war purposes, beyond the period of the war and into conditions of peace. The addition of a state system having the same demerit could certainly have none other than similar harmful effects.

The corporation tax proposed by the administration has another bad side. It would levy the bulk of the taxes produced by it in the industrial cities, thereby relieving the general properties of the state from their share of the burdens of government. Such a plan as is proposed today would derive 60 per cent of its income from Wayne county alone. It would probably derive 90 per cent of its product in taxation from the counties of Wayne, Kent, Saginaw, Bay, Genesee, Oakland, Jackson, Calhoun and Kalamazoo. Such a distribution of the burdens of the state's government would be bound to be sectional. With the bulk of the income derived from the industrial counties of the state, and the bulk of the votes which determine the expenditure of state revenue coming from the agricultural counties and those possessing only small village industrial centers, it would not be long before the farmers would be making ducks and drakes of the state's revenue. Taxation without representation and expenditure of public money without responsibility to the territory from which it is derived are hardly conditions which Michigan should care to encourage in this day and generation.

The great sense of Michigan should find expression on the matter of state taxation in a clarion call for the reduction of state expenditures rather than in their increase. It is the most arrant nonsense to say that the growth of the state and the enlargement of the functions of government are calling for the tremendous increase in state expenditures that is proposed this

Digitized by Google

year. The net income of the state is becoming so shrunken between bad business conditions and increases of state and federal tax levies that our ordinary and necessary accrual of new capital for normal growth has become interrupted. We read that in the lowered proportion of increase of commercial and savings deposits which our consolidated bank statements show. Let us be careful that we do not read it further in a reduction of the opportunities of employment in Michigan, reflected by the diminution of industry.

Hoist by Their Own Petard

THE USUAL—and entirely sound—arguments against the eight-hour bill introduced in the Michigan legislature will be advanced. It will be contended that in these times of business readjustment every man who wants to work ought to be encouraged to work, with no limitation on his efforts, and that no artificial conditions should be set up whereby the cost of producing the necessities of life will be increased. It seems to us, however, that most of the opposition to the measure ought to come from workingmen themselves.

The reason for their opposition will be found in the developments that will follow the enactment of such a statute. When the demand for manufactured commodities becomes normal again and the factories are hard put to it to turn out enough goods to fill their orders, more than eight hours of daily work probably will be necessary. With an eight-hour law in effect, is the employer going to pay the time and a half overtime fixed by the statute? He may in some cases and under certain conditions, but the majority of manufacturers will adopt the more economical procedure of putting on more than one eight-hour shift, operating their plants sixteen or even twenty-four hours a day and paying their men regular time rates only. The result will be that the prospect of overtime will fade from the view of the very interests seeking to obtain it by statute.

From another standpoint, eight-hour shifts would be advantageous to manufacturers who found themselves overstocked with orders, in that they would make possible a reduction of interest, rent and certain other fixed charges and effect a saving in investment in equipment. Why let the machinery lie idle sixteen hours a day, when it might work sixteen or even twenty-four? Or, why install more when the present equipment will suffice if operated more steadily?

Another One

HOUSE BILL NO. 100 provides that no person may be employed upon any public work by any municipality or by the state or its departments unless such person has resided in the state at least six months. The proponents of this measure probably have in mind the present unemployment situation and desire to sew up public improvement jobs for Michigan workmen. If the slack period were likely to last any great length of time, the proposal to give such work to home people exclusively might not be so bad, but when the outlook is that by the time weather conditions are such as to permit the resumption of improvements, industrial conditions will have recovered in a measure sufficient to bring most of those now idle back into the factories, legislation such as this bill proposes becomes harmful. With the current oversupply of labor absorbed, the state and the municipalities would find themselves hamstrung by the inhibition against allowing contractors to import labor, with the result that public improvements which now too long have been held up by money conditions and other difficulties would be further delayed.

The bill ought to be defeated.

Have You Signed Your Waiver?

A CORRESPONDENT has submitted for inspection a letter received from the Bureau of Internal Revenue, at Washington, which invites his company to sign a waiver of the necessity of the revenue department's auditing the 1917 returns by March 1, 1921, as provided by law. The waiver reads in part as follows:

"In consideration of the assurance given it by officials of the Income Tax Unit of the Bureau of Internal Revenue that its liability for all federal taxes imposed for the year 1917 shall not be determined except after deliberate, intensive and thorough consideration,——————hereby waives any and all statutory limitations as to the time within which assessments based upon such liability may be entered." Boiled down, the proposition is about as follows: We are unable to audit your 1917 returns as provided by law, and therefore ask you to extend the time for us and to continue your liability. If you do not do so, it may be necessary to audit your return in a hurry, in which event it may cost you more or perhaps less than it should.

Manufacturers with a lofty spirit of willingness to support the government may feel inclined to co-operate, but in view of the methods of the bureau often complained of, one would hardly blame a man for not signing the waiver.

Short Measure Stuff

VALENTINES

From us to the Police Commissioner

You may be my valentine
If your efforts don't relax,
And keep the bandits off my trail
Till I've paid my income tax.

—

Gov. Groesbeck to Warden Fuller

I don't like some of the things you've done,
I want your job for a friend of mine.
So if you will kindly ring in your time,
Why then I will be your valentine.

—

Dr. Burton to the State Legislature

Our school is too small and it's wearing out,
A bunch of new buildings would be just fine.
So you may present us, if you please,
With an eight million dollar valentine.

—

"Gus" Schantz to the Boys

This year I cannot run my boats
As far as Mackinaw,
Unless I get a valentine
That kills the seaman's law.

* * *

WINE LID OFF, IF DOC SAYS SO

—Newspaper Headline.

"I can feel myself slipping," moans W. P. M. "I just know I'm going to suffer a relapse."

* * *

A Detroit woman is suing a physician for loss of a leg. Maybe he pulled a little too hard.

* * *

Burbank has grown some beardless barley,
And science sets up quite a cheer;
Yet there was not a murmur, hardly,
When we home brewed some hirtless beer.

* * *

The man who invented Lent was the original "back to normal" advocate.

FINANCIAL

THE BUSINESS OUTLOOK

By PHIL S. HANNA

IT IS VERY EASY these days to find plenty of sentiment and prediction expressed according to the wish of the prophet rather than according to Simon pure belief. As a man who has something to sell that cost him more than present prices will bring and he will tell you that the price adjustment has run its course and that we may expect an upturn rather than a further drop; but dig out the man who is out of the selling market—which species of man is, of course, rare at present—and he will tell you a different story. In fact, there is much in the present attitude of business men that may be compared with the mental state of a man convalescing from a severe illness—the fever has passed, the crisis is over and the mind is normal, but the body is at that state of recovery where long days of rest and quiet recuperation are necessary. The patient in the case, moreover, is a pretty husky proposition and will be hard to hold down, but Dr. F. R. Board gave out some pretty sound warning about a year ago which the patient now has begun to think about; and what is more pointed, the new doctor saved the country from undergoing a serious operation. More than likely, therefore, the patient will heed "doctor's orders" for the time being.

Our home situation is good. Comparatively it is better than many of us realize, and the figures of clearings, borrowings and deposits go quite a way toward proof of it. Detroit clearings for the week ended February 9 were $76,606,462, compared with $101,049,806 for the same week a year ago. Take off the latter figure an amount ranging from 25 to 30 per cent due to lower prices—say the difference is only 15 per cent, or about $15,000,000, which would make the comparison ratio 76 for the week this year, against 85 a year ago and the decrease in volume of transactions as represented by clearings is nowhere near the decrease that might be expected as a result of the supposed falling-off in business.

Bank deposits, as this is written, are resisting nicely the downward abrupt tendency of the period around the holidays, and borrowing of banks, as shown by the statements of the Chicago Federal Reserve Bank, are letting up. On December 30, 1920, the banks of the Seventh District owed the Chicago bank $475,000,000 in borrowed money obligations, whereas the total on February 4 was $369,000,000. Taking the combined returns of the Reserve Banks into consideration, the figures for February 4 show a desirable improvement over the previous week. Members' loans and rediscounts decreased $23,000,0000, circulation decreased $15,000,000 and members' deposits went up $28,146,000; and a further agreeable trend to be noticed is that the southern and western Reserve Banks are taking back part of the paper previously rediscounted with Boston, Cleveland and Philadelphia Reserve Banks. Even San Francisco had enough surplus to justify its taking $15,654,000 of paper for New York.

It is a singular circumstance, in view of the tendency shown by nearly all the other Reserve Banks toward an increase in reserve ratios, that the New York Reserve Bank continues week after week as a tail-ender in this respect. On reviewing reports since December 30 it appears that on only two occasions did any other Reserve Bank bring up the rear in the matter of reserve ratios, and the exception in each instance was Minneapolis, which beyond doubt may justify over-extension of credit, if any, by the delicate banking situations within its province. But New York, which, by the way, represents nearly 30 per cent of the combined federal bank resources ($1,707,634,000 or assets as against total assets of the system of $5,849,053,000 on February 4) continues as a laggard. Our esteemed contemporary, the Commercial & Financial Chronicle of New York, devoted much space some months ago in an effort to discourage peak load credit undertakings by the New York Reserve Bank, and if the present ratio has been brought about by unnecessary original credit granting in New York, it would seem to be about time to begin the campaign anew.

As predicted in these columns January 1, there came a fair sized revival during January, and it has extended well into February, notwithstanding the continuance of weather which does not help the clothiers. It is the more remarkable therefore to note quite a pronounced improvement in the textile industries. But on the whole, while the general trend is upward, there are spots of resistance here and there that must be disinfected before we may expect any extended gains. The chief of these is the railroad conundrum. In spite of rates nearly double pre-war figures, we are treated with every report to an exhibit of diminishing returns. It would be a blessing provided the experiment could be made without holding up business, if a section of the roads could be turned over to the union managers "as is," financially and physically, with the stipulation that they run the roads without further government or private financial assistance for a period of six months, and with a distinct provision that the unions make good any losses or take any gains over 6 per cent after all expenses. The reader may draw his own conclusions; imagination needs but little fertilizer to picture results.

There is one event locally that tends to prove that some workers are sure that business has fully recovered, and that is the strike at the Fisher Body plant. A discerning business man interprets the workers' action to mean that they think business so good that they can afford to walk out.

M'CORD BOOK VALUE $26 A SHARE

Company's Difficulties Due to Plant Expansion, Followed by Business Slump; Little Danger of Loss

DETROIT business suffered a mild shock early in the week when bankers interested in the McCord Manufacturing Company issued invitations to creditors to attend a meeting at the Board of Commerce on Friday, February 11, for the purpose of appointing an advisory committee of creditors to determine the future policy of the company.

Investigation, however, reveals that there is small likelihood of any loss either to creditors or stockholders if arrangements proposed by the committee can be carried out at once. It is known that the chief difficulties have arisen because of unprofitable operations of the West Pullman plant, the auditors' preliminary report exhibiting enough of a loss here to wipe out the ample profits at the other plants. Parties close to the situation express the conviction that the disposal of this one enterprise (West Pullman) will remove the chief obstacle in the way of profits.

It is noteworthy that net profits for 1920 of $34,000 were made nootwithstanding the losses and after paying out $400,000 in dividends during the year. An item of $635,000 representing inventory reduction to market brings the net gain down to a minns figure of $601,743 for the year. But on the basis of the preliminary statement, and collections and reserves all taken out, there remains a book value of $3,290,000 surplus applicable to 125,000 shares of common stock, or $26 a share. The situation viewed from all angles is the familiar result of the sudden business recession of last year. Like many other manufacturing companies, McCord was spurred on by a desire to catch up in facilities for prodnction with the insatiable demand for goods, and the slump caught it with large property and inventory account, small cash assets and a too large borrowed money liability. There is a large surplus in property assets over the funded debt and ample inventory and current assets to cover liabilities of all kinds if creditors will accept the situation and get behind the bankers' movement to work it out deliberately. A rush to force collection will avail little. For comparison we present an approximated statement:

Assets	Dec. 31, 1920	Dec. 31, 1919
Cash	78,000	$ 380,000
Government bonds and notes		21,000
Accounts receivable	1,201,000	1,691,000
Inventory	4,166,990	3,442,000
Plant and permanent assets	5,403,000	5,369,000
Other assets	335,000	524,000
	$11,783,000	$11,627,000
Liabilities		
Preferred stock	$ 1,325,000	$ 1,243,000
Notes payable	3,588,000	1,602,000
Accounts payable	1,374,000	1,126,000
Funded debt	1,957,000	2,174,000
Other liabilities and reserves	249,000	959,000
Surplus for common	3,290,000	4,523,000
	$11,783,000	$11,627,000
Sales for 1920		$14,829,000
Less cost	$12,784,000	
Overhead and miscellaneous	1,034,000	
Other costs	483,000	
		$14,286,000
Net		$ 34,600
Less adjustment of inventory to market		635,000
Deficit		$ 601,000

The bankers committee is comprised of the following: Frank G. Smith, vice-president, First and Old Detroit National Bank, Detroit; W. L. Dunham, vice-president, Dime Savings Bank, Detroit; John Fletcher, vice-president, Fort Dearborn National Bank, Chicago; Ralph Van Vechten, vice-president, Continental and Commercial National Bank, Chicago; H. MURCHEY BROADENING SERVICE

G. N. Murchey & Company, who have been established in Lansing two years, are extending their investment business. Mr. Murchey has been in Lansing four years, having represented William A. Neer & Company, Detroit. Two years ago he organized the local company to provide full investment service.

The departments which have now been created include the New York department, in charge of H. P. Quinlan; trading, directed by G. Roger Hawkins, who has been with the Neer company until recently; and investment, in charge of Lyman Covell, who is backing a community merchandising campaign for the distribution of securities. These departments, together with all other branches of the business are under the general direction of Mr. Murchey.

The firm has direct connections with all stock centers. Its offices are at 100 Capital National Bank building.

CLEARING HOUSE ELECTION

At the annual meeting of the Detroit Clearing House Association, William Livingstone was elected president and J. L. Langton, secretary and manager. The clearing House committee comprises John Ballantyne, Julius H. Haase, Emory W. Clark, George H. Kirchner and James T. Keena.

New Export Problems

Mere order-taking in foreign trade has had its day. Though American shipments of foods, merchandise and materials over-seas continue large, exporters in every line recognize that the turn in the tide has come.

In future, goods that go abroad must first be sold. Customers must be sought, studied, served. Markets must be developed and connections formed on a basis of information and analysis even more exact than those required in securing business in the past.

In making contacts with unfamiliar markets—in keeping touch with changing conditions—in carrying out the financial or shipping operations required in over-seas transactions—the Irving's Foreign Service and Foreign Trade Divisions may be able to supply you with just the information, counsel or banking and commercial aid you need. For exporters—as well as importers—Irving spans all seas.

Banks and Bankers

NEW BANK AT MILFORD

The Farmers State Savings Bank has been organized at Milford, Oakland county, to do a commercial and savings business. The capital is $50,000 and the principal incorporators Arthur M. Bird and Fred Childs, Milford, and Harmon A. Smith, Wixom.

RACHOW ORGANIZES BANK

W. J. Rachow, former manager of the savings department of the First and Old Detroit National Bank, Detroit, has acquired an interest in the Central Foreign Exchange Corporation of Hamtramck, and has organized what is to be known as the Citizens Bank of Hamtramck, Beger, Rachow, Stefanowski & Company, bankers, which is to open for business about February 15 at 9701 Jos. Campau avenue, operating as a unified institution in a general banking business, handling also foreign exchange, real estate mortgages and steamship transportation. Mr. Rachow came to Detroit about four years ago from Charlevoix, where he was cashier of the State Savings Bank.

LANSING MERGER EFFECTIVE FEB. 14

The consolidation of the Lansing State Savings Bank with the American State Savings Bank has been ratified by the stockholders and the united institutions will open February 14 under the name American State Savings Bank. The Lansing bank has had a separate existence of 30 years and the American of 19. J. Edward Roe, president of the Lansing bank, becomes head of the American State Savings Bank, with Cashier Charles E. Toms, of the American, as cashier of the consolidated banks. Practically the entire clerical staff will be retained, as will the two branches.

F. C. WHERRETT MOVES UP

Harry D. Bennett, who since 1908 has been an officer of the Capital National Bank, Lansing, resigned, effective March 1, to take over the duties of secretary-treasurer of the Garlock Sales Company. He has held the latter position some time. Mr. Bennett has been assistant cashier at the bank for several years, having moved to Lansing 13 years ago from Eaton Rapids, where he had five years of banking experience. He started at the Capital National as teller. He will be succeeded by Fred C. Wherrett, next in line.

PARKS WOLVERINE DIRECTOR

E. F. Parks, president of the First National Bank, Paw Paw, has been elected as a director of the Wolverine Insurance Company, Lansing.

FIRST NATIONAL, MUNISING

Deposits, $1,432,688; capital, surplus and profits, $182,662. No borrowed money and a 20 per cent reserve, as per statement of December 29, 1920, just received. This is the bank of which Chester D. Masters, formerly cashier of the First State Bank, Petoskey, has recently taken charge.

FENTON, DAVIS & BOYLE DIVIDEND

At a meeting of the board of directors of Fenton, Davis & Boyle, Chicago, Detroit and Grand Rapids, a dividend at the rate of 7 per cent per annum was declared on the preferred stock of the corporation computed to and including December 31, 1920, to stockholders of record on January 25, 1921.

Addressograph
For Sale

Motor Driven Model B, in good condition. Prints direct from ink. Has "lister" attachment for running off lists from address plates. A bargain buy. See Mr. Grimm or Mr. Walker, Security Trust Co., Detroit.

Accounts Payable	50,780.01	14,661.71
	$325,475.44	$325,244.45

Net earnings after deduction of taxes: 1917, $10,000; 1918, $13,000; 1919 and 1920, none reported.

Board of directors: T. W. McAndrew, G. M. Hull, D. L. Quick, Jr., Geo. Geer, C. V. Brown. Officers: President, T. W. McAndrew; vice-president, G. M. Hull; treasurer, D. L. Quick, Jr., secretary and general manager, C. V. Brown.

Orders booked, not shipped, December 31, 1920, totaled $189,635.33.

Opportunity

Any investment review of the past year must unfailingly select as its outstanding feature the high bond yields offered during the entire period. No similar opportunity has ever been presented to the present generation of investors, nor, when the turn comes, is it likely to be repeated in our lifetime.

Those who have secured high interest yields (8% or more) by investing in safe, long-term bonds, have good reason to look back at the year with complacency. To those who have not, thought must suggest the impulse—the resolution—to seize the opportunity before it slips away forever.

It was our privilege, during 1920, to start thousands along the road that leads to financial independence by means of helpful investment advice. The same help is available (without obligation) to all old and new friends who need our analysis and solution of their individual investment problems.

Status of Trust Company-State Bank Legislation

According to latest advices from Lansing, Rep. Joe Watson's bill to give state banks trust powers may come out of committee in amended form with enough of the author's measure left to give the small banks power to act as administrator and executor.

The outcome of this proposed legislation will be watched with much interest by the banking fraternity. It is admitted by some of the smaller national banks which have undertaken a trust business by means of availing themselves of the amendment to the Federal Reserve Act that the business is not profitable. Yet others testify that their new departments are a success. Trust company officials of Detroit point out that there is no particular objection to permitting small banks to act as administrator or executor, but that a broad grant of trust powers to banks doing a general banking business should be followed by a provision that trust companies as such may have general banking powers. A point often lost sight of is that failure to perform under a trust agreement may create a liability greater, in cases, than the entire capital of a small bank. The circumstances surrounding country banking are so different from those of the large cities that it doubtless will be difficult to frame legislation that will be equitable; yet it were much better to bring the miscellaneous trust activities of the small bank cashiers within the purview of the bank examiner, whereby they may be checked up twice a year, than to go on under the system which has been so long in practice, with little or no supervision.

The Great Lakes Engineering Works, Detroit, has declared a liquidating dividend of 50 per cent on stock of record February 7, payable February 10 on a basis of 25 per cent in cash and 25 per cent in bonds of the new corporation which purchased the properties of the original company. A 100 per cent liquidating dividend was paid in October. The name of the corporation will be retained.

Nicholson Heads Foreign Trade Bank Committee

Walter G. Nicholson, vice-president and cashier of the First and Old Detroit National Bank, has been appointed chairman of the Supervising Committee for Detroit of the Foreign Trade Financing Corporation. Roy D. Chapin, president of the Hudson Motor Car Company, will represent the commercial interests, and a prominent upstate farmer, whose name will be announced later, will represent the agricultural interests.

The immediate activities of the committee will consist in providing a market for the stock of the corporation. It is hoped to spread the stock around among diversified business and agricultural interests so widely that the corporation may have the support of many interests as soon as it begins to function.

A New York correspondent advises that arrangements looking toward obtaining guaranties by foreign municipalities of credits that may be arranged for business concerns located in various foreign cities already have been taken up, and that the committees have been given much encouragement in this direction.

MICHIGAN STOVE'S YEAR

Francis Palms, first vice-president of the Michigan Stove Company, writes that "the business for 1920 was very gratifying, eclipsing all past years in point of volume, notwithstanding the slump experienced during the last two months of the year. Stocks are not excessive, and we anticipate a very good year's business in 1921." Directors elected at the annual meeting, January 31, are: George H. Barbour, C. A. DuCharme, E. S. Barbour, H. B. Gillespie, L. B. Young, D. J. Dwyer, C. B. DuCharme, Francis Palms, C. L. Palms, R. B. Mills. H. B. Gillespie was elected to fill the vacancy caused by the retirement of Edwin S. Barbour, who will travel for his health. Other officers were elected as follows: Chairman, George H. Barbour; president, C. A. DuCharme; first vice-president, Francis Palms; general manager, L. B. Young; secretary, C. B. DuCharme; treasurer, H. B. Gillespie; vice-president and factory manager, E. J. Dwyer. Total assets as of December 31, 1920, were $4,803,932. Current assets were $1,855,913, against $963,043 of current liabilities. Preferred stock outstanding was $1,543,000, common, $1,500,000, and surplus was $797,888.

PERMANENT BONDS READY

Detroit banks have announced that they are now able to make delivery of permanent Liberty loan bonds of the fourth 4¼ per cent issue which may be exchanged for the temporary bonds issued originally. This will be welcome news to those who have been obliged to wait the deliberate action of the Government.

HALSEY NATIONAL CITY CO. MANAGER

Ralph W. Halsey, New York, is the new sales manager for the Michigan district, which comprises the lower peninsula of Michigan, for the National City Company, New York, with offices in the McGraw building, Detroit. Mr. Halsey succeeds Harvey Hughes, the former manager, who resigned December 15 to form a company of his own. It is understood that formal announcement will be made in the near future.

MICHIGAN SUGAR DIVIDEND

The Michigan Sugar Company had declared a dividend of 1 per cent, payable March 1 to stockholders of record February 15. According to Stock Exchange records the last dividend was 3 per cent, paid December 1, 1920.

Who's Who In Michigan Finance

Chester D. Masters, Cashier and Manager, First National Bank, Munising

Chester D. Masters, recently elected cashier and manager of the First National Bank, Munising, has had a variety of banking experience which fits him eminently for the position that now has been given him.

Mr. Masters is a native of Buffalo, where he attended the public schools. Thereafter he was a student in Kitchener Collegiate Institute, Kitchener, Ont., where his father is still a merchant and has interests in elevator and flour mill.

In 1909 he graduated from the Detroit College of Law and went into the First & Old Detroit National Bank, leaving in 1910 to become associated with the Cleveland-Cliffs Iron Company's bank at Gwinn, Mich., serving as

CHESTER D. MASTERS

cashier until November, 1916, when he became cashier of the First State Bank of Petoskey.

In 1918 he was made a director of the Petoskey bank and severed his connection with it January 15, 1921, to accept the position he now holds at Munising, where he is cashier, director and manager of the First National Bank of Alger County.

In June, 1918, he was given a year's leave of absence to join the army and went overseas as a private. During his service in the army he was advanced to a second lieutenancy. He was married in 1917 to Margaret Anne Murray, of Wausau, Wis., and has one daughter, six months old. Masters has always been identified with the best interests of the communities in which he has been situated; he is a clean, high grade type of man, plays a good game of golf and is an officer in Ivanhoe Commandery, Knights Templar, and in Petoskey Lodge, B. P. O. E.

PAPER MERGER AT MONROE

The Monroe Corrugated Box Company and the River Raisin Paper Company, Monroe, have been merged and the River Raisin company has increased its capitalization from $2,500,000 to $5,080,000 as a consequence.

A Service of Facts

Through contact with every phase of big business, and as a result of the exhaustive and constant study of economic conditions which is essential to the safe conduct of a great bank, the National Bank of Commerce in New York is able to render to its friends a peculiarly valuable service.

Broadly speaking, we are in a position to supply authoritative information, drawn from original sources, on practically every important matter related to commerce and industry, whether national or international.

Our friends, in this sensitive period of adjustment, are invited to employ this service to the fullest extent.

Michigan's Rate Problem of the Moment

(Continued from Page 6)

do a large amount of terminal work for their connecting lines east, south and west. This is perhaps well illustrated by the interchange with the Baltimore & Ohio Railroad. This company does not have any mileage in Michigan, either owned directly or indirectly. At the same time it does a very large business in the state, both through the Toledo gateway and through its Indiana junctions, connecting as it does with the Grand Trunk, G. R. & I., Pere Marquette and other north-and-south lines. For example, for the year ended June 30, 1916, they received (B. & O. and C., H. & D. combined) from the Pere Marquette 210,550 tons of freight, and delivered to the Pere Marquette, largely for Michigan points, 525,000 tons. On a very large proportion of this business the B. & O. received a long haul and the Michigan roads a short haul, and in order to reach the consuming points in Michigan the Pere Marquette, for example, was obliged to make three or four train movements, retailing the business out one car at a time, whereas it moves on the B. & O. largely in train loads for two junction points. This puts a heavy operating burden on the Michigan lines both in the matter of train movements and in the matter of per diem. What I have said about the B. & O. is equally true of the other roads.

It must not be overlooked that the principal roads in the territory south of Michigan, especially Ohio and Indiana, are on the great highway between the east and the west, and the north and the south. They get a large amount of business passing north and south to and from Michigan, and a very large amount of business east and west originating west of Indiana and south of the Ohio river and passing to trunk line territory east of Buffalo and Pittsburg. There is hardly a road of any size in the Ohio and Indiana territory but handles a considerable portion of through business. On the other hand, some of the Michigan railroads of considerable mileage handle very little through traffic. Take the Detroit & Mackinac Railroad for example. It handles absolutely no through traffic. The Manistee & Northeastern is another example. There are several smaller roads that are purely local switching lines, handling no through traffic and depending entirely upon the larger railroads in Michigan for their equipment and service.

Empty Car Mileage

It should also be kept in mind that a very considerable portion of traffic coming into Michigan is coal, and a large proportion of this is in open cars, very many of which are obliged to go back to junction point empty. This is especially true of the large self-clearing gondolas. This means a large empty car mileage for the Michigan railroads. It also happens that considerable of the outbound business of Michigan is made up of fruit, automobiles and other light and bulky articles, many times requiring large cars or cars with special doors, and these oftentimes have to be handled empty from the junction point to the industries in Michigan, which means a large empty car mileage.

The railroads of Michigan have so many branches that it is hard to compare their operation with that of some of the roads further south. This can perhaps be illustrated by referring to the movement of a carload of freight from Harbor Beach to Chicago, about 425 miles, compared with a similar movement on the Nickel Plate Railroad from Erie, Pa., to Chicago. The car from Harbor Beach has to move in four or five different trains, whereas a car from Erie to Chicago on the Nickel Plate would be put into a through train at Erie and kept intact to destination, there being no operating reason for setting it out at any point. This illustration can be amplified in almost any part of the Michigan territory.

There seem to be two principal factors which operate against the transportation situation in Michigan. The first is the lack of density of traffic and the second is the difficulties of operation due to the climatic conditions and the larger number of branch lines. If they cannot get the density of traffic, they certainly must have higher rates on such traffic as they do move.

No matter what rates are effective in Indiana and Ohio the operating conditions in Michigan will always be bad in comparison with these states.

With all these conditions facing the Michigan lines, it was thought that the only way to spread the burden of rate increase was slightly to raise the scale of rates in parts of lower Michigan, and three zones were proposed.

Zone A embraces all points on and south of the main line of the Michigan Central Railroad, Detroit to New Buffalo. The reason for this line was the fact that the New York Central Railroad touched Detroit, Ypsilanti, Jackson, Battle Creek and Kalamazoo, and they did not see how they could carry one basis of rates in Ohio and Indiana and another in Michigan.

Zone B extended from zone A to a line running from Port Huron through Bay City, Midland and Greenville, to Muskegon.

Zone C extended from Zone B to the Straits of Mackinaw.

When the case was explained to the Interstate Commerce Commission it not only approved the plan but separated Zone C into two zones.

To and from each of these zones the interstate rates were graded up from Zone A and the increase over the regular, or Zone A, rates went to the Michigan roads on account of their disability.

Local differences were very slight compared with the general rate increases since ordered by the Government, and I am not convinced that it is possible to determine whether or not any serious results have come from the zone system.

Crippling Michigan's Roads

The real point is this. If the revenues now derived by the Michigan roads from the zone system of rates are taken from them, what plan is to be substituted to bring the same results?

If we cripple the Michigan railroads by cutting off their earnings without also providing some way of reimbursement, nothing will be gained, because crippled railroads cannot give good service and furnish necessary facilities.

Of course, under the recent railway legislation, the Interstate Commerce Commission can fix the division of earnings; and this is, so far as I can see, the only means of protecting the carriers in this state.

It must not be taken as a foregone conclusion that the present system of divisions is wrong and that a readjustment can be had for the asking.

The New England railroads, whose rates are now as high as in Michigan, are now before the Commission in a case of this kind. If the present divisions allowed the New England roads are found to be insufficient and a readjustment is ordered, it means that roads like the Grand Trunk, Pere Marquette, Ann Arbor and other Michigan lines must back into their proportions to pay the New England lines.

If this question of the zone rates is to come up by complaint before the Interstate Commerce Commission, careful consideration should be given at the same time to the best method of protecting the Michigan roads by readjustment of percentages or divisions, for if this is not done it will simply throw them back into the same relative position as they were in 1916, when nearly every road in the state, except the Michigan Central, was in a bad way financially —and the Michigan Central would have been just as badly off had it not been for its through business and rich relations.

Commercial Banking

service must, above all, assure accuracy based upon a knowledge of conditions and possibilities of the field in which it is rendered. Thirty-six years of successful operation has enabled the Dime Savings Bank to acquire this most essential knowledge—and this is the governing basis of all its service to banks, firms and individuals.

What do the people and industries of Michigan most need from their railways?

Remember, we are running on an ebb tide in business and must not forget that the present recession is only temporary.

What may we expect when the tide turns?

The railroads are not, as a rule, buying new cars. Look at the weekly pages of the Railway Age and you will see but few of them are even making any inquiry regarding equipment.

None of the Michigan railroads, with the possible exception of the Michigan Central, is properly equipped to handle the natural increase of business in the next five years. Compared with some of the eastern roads, their facilities are very limited, and the only reason for this condition is that they have not had the money.

History will repeat itself and when the flood tide of business comes we will have worse than the former car shortages, congested yards and scarcity of power.

Flint As an Example

In Flint, for example, we need heavy expenditures by both railroads. A recent number of the Flint Saturday Night told at some length of the city's transportation needs. It will cost more than $1,000,000 to give Flint what is needed today to make our service ample.

Where is the money coming from?

There is a homely saying that "you can't get blood from a turnip," and in this instance you can't get money from railroads if they do not earn it.

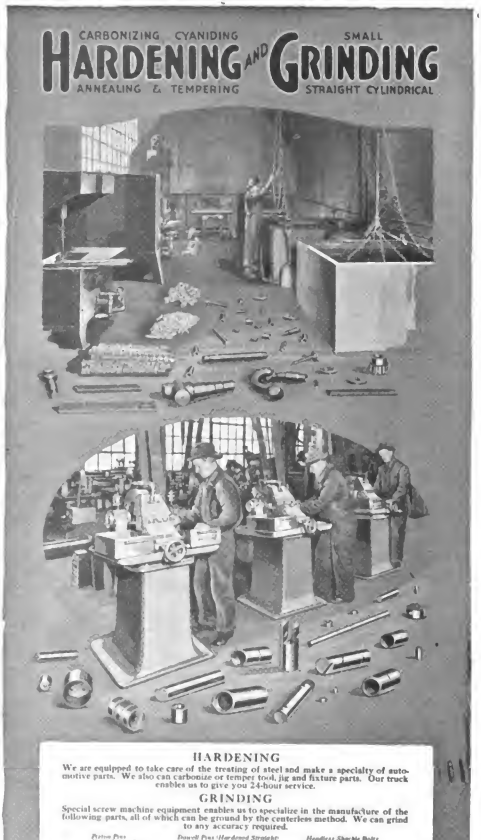
No doubt some specific rates are too high and require readjustment for the mutual benefit of the public and railroads, because rates which are prohibitive never produce revenue. These can be reviewed and adjusted.

Those who worked out the zone system in 1916 knew it was not a perfect solution, but at the time it was the best that could be suggested. It took weeks of thought and careful study by the railroad people, and a long time by the Interstate Commerce Commission, to get for the railroads this partial relief.

If someone now has a better plan for helping the present general rate situation and can work out some logical way of reducing the rates and at the same time producing sufficient revenues to provide new cars and improved facilities, we should all welcome such an effort; but it should be along constructive lines with an eye always on the final results to the shipping and traveling public.

Editor's Note: The foregoing is part of an address delivered by Mr. Cyon before the Transportation Club of the Flint Board of Commerce, at the Hotel Durant, February 3.

TO FACILITATE ROAD BUILDING



Adoption of a plan for a closer-knit policy in the construction of highways, as against the present hit-and-miss methods, is under consideration by Gov. Groesbeck.

Freight rates within the state have increased so much that they threaten road work, according to Frank F. Rogers, state highway commissioner, in testimony before the Michigan Public Utilities Commission. In some cases it costs $7,500 a mile in road construction.

Another condition that threatens road construction is the failure to sell the last $1,600,000 issue of highway bonds, only one bid at $98.50 for $50,000 being received. The 1919 law provides for $50,000,000 of bonds for trunk highway construction, to be sold at par with 5 per cent interest, but the present condition of the money market makes it difficult to dispose of them.

GALVIN JOINS MUSKEGON CHAMBER

Manager J. E. Coad, of the Muskegon Chamber of Commerce, announces that Howard E. Galvin, who has been manager and secretary of the Chamber of Commerce of Oelwein, Ia., has become assistant manager of the Muskegon chamber.

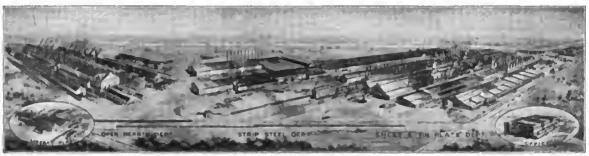
Why the North Dakota Failures

(Continued from Page 10)

credit in fact, however, being largely a belief in the honesty of purpose and ability of the borrower. Then there came those years of poor crops when interest was added to principal and the whole was renewed again and again on the security of prospective crops. It is small wonder with such a hountiful and persistent extension of credit that the North Dakota farmer readily embraced the doctrine that he need not pay notes if prices of crops were not to his liking.



In many towns money, other than pocket change, has almost disappeared. An oversupply of banks has made each banker timid about forcing payment of notes. The well-to-do farmer is the best depositor, and if forced to sell crops he has shown his resentment by withdrawing his deposits, with the result that there has been much liquidation of loans and a corresponding drop in deposits. Thereafter this farmer has sold only such wheat as he has needed money for groceries and clothing, and instead of depositing his wheat checks in the bank he has taken them in small installments direct to the grocery and has given them over in payment for goods. To add to the banker's troubles, he has found that persons in Iowa, Minnesota and Wisconsin and other distant states, who previously had been his best depositors on time certificates, began more than two years ago to withdraw their funds in fear of Townley taxes or other ill effects of the bolshevist operations in the state. Then the Federal Farm Loan Banks cut off the farm loan supply because of laws which made bail insurance premiums and other liens prior to mortgages; and, finally, the investors in farm mortgages, which in the aggregate have been the greatest single source of money supply, began to ask for payment of mortgage at maturity instead of reinvestment of their funds, as was uniformly the custom heretofore. Now add to this loss of outside funds, the total of which is easily more than twice the normal home bank credits, an item running up into the hundred of thousands of dollars representing investment by the farmers of North Dakota in blue sky stocks, prominent among which is a cat ranch, a safety razor factory, an automobile plant, Cuban fruit ranches and scores of other remote enterprises, and it may be readily ascertained why many of the small banks have been embarrassed.

But the End is in Sight

But the worm has turned. It has been a bitter pill, but it will take more than these misfortunes to uproot the confidence which the average North Dakotan has in his broad acres. The improvements in roads, buildings, fences, stock and farming methods in the five years since the war left are astonishing. And all in spite of the millstone which has been hung around his neck. Little hamlets that used to have but one acetylene street light and only oil house lamps have complete electrical lighting systems, and the statement was made at Valley City that there are more of these single flue furnaces in the farmers' homes than stoves. Politically, a great change is on the way. The Leaguers control the state Senate by one vote, but the conservative elements control the House by three votes, and there is an easily discerned desire on the part of some of the Leaguers to switch gracefully over to the conservative hand wagon before the seats are all filled. The chairman of the House committee on banking is studying the Michigan banking law in an endeavor to find something that will put the North Dakota banks on a safe footing.

Editor's Note: This is the second of two articles by Mr. Hanna, financial editor of the Michigan Manufacturer and Financial Record, who returned late last week from a trip of investigation of banking conditions in the Northwest. The first article was published last week.

How Steel Balls Are Made

(Continued from Page 8)

the balls being rotated between a grinding wheel and a cast iron disc having grooves in which the balls travel. The balls enter the machine, fall into a groove, travel once around the grinding wheel and come out again, the stream of balls entering at one side of the disc and leaving it through another opening continuously. This constantly changing stream precludes the possibility of one ball, perhaps a trifle larger than the rest, wearing a groove in the grinding wheel. Pressure is applied back of the disc until the balls are approximately the size required, then the pressure is gradually removed, so that when the balls are finished, they are perfectly round and all of the same size.

The balls now pass to the oil grinding machines, where the final grinding takes place. This operation removes any fine scratches left on the balls by the Hoffman machines and brings them down to within four ten-thousandths of the proper size. In this operation the balls are rotated in a mixture of machine oil and a very fine abrasive under pressure, the pressure being applied by a revolving cast iron ring or plate. After this operation they are again cleaned in hardwood sawdust and then proceed to the finishing room.

The balls are now put into tumbling barrels containing a mixture of oil and Vienna lime, in which they are rolled for a sufficient length of time to give them a preliminary polish, after which they are removed and again cleaned in a special machine of the type previously described, using hardwood sawdust. They are then put into kegs containing strips of kid similar to that from which gloves are made, in which they are rolled for from twenty to twenty-five minutes. Rolling the balls this way gives them the high polish which is the final step in the process. They are now ready for the final inspection.

Non-Ferrous Alloy Balls

Balls of brass, bronze, aluminum, nickel, monel metal and other alloys are also made in this plant, such balls being used in various forms of valves and other mechanical parts where a metal which will resist corrosive action is necessary. The general features of the method in producing these balls are the same as those employed in making steel balls, but there are certain modifications which will prove of interest.

Brass ball blanks up to one inch in diameter are made in cold-headers, while blanks for balls exceeding this size are forged. In the case of very large balls, the practice is often adopted of making the blanks hollow, which is done by casting them with a sand core which is subsequently removed. Then, in order to prepare the blank for finishing, the holes left by the core prints are drilled and tapped so that threaded plugs may be screwed in. These hollow ball blanks are then subjected to a modification of the regular process if small, and the larger ones are turned in a lathe equipped with special apparatus for this operation, after which they are polished. The small balls are subjected to a dry-grinding process which makes them approximately spherical, after which they are ground in the Hoffman machines, oil-ground, and then polished.

After receiving their final polish, the finished balls go to the inspection department, where all the defective balls are eliminated and those which pass inspection are separated into various grades according to the accuracy of their dimensions. After the final polishing the balls are not touched with the bare hands, as even the moisture from a person's fingers would be sufficient to cause rust.

The first inspection is the "plate inspection," a number of balls being placed on a glass plate which is painted black on the under side. Back of each plate is a reflector which throws light on the balls, and a strip of thin, flexible cardboard is drawn back and forth beneath the balls to rotate them and bring all surfaces into view. Such balls as have cracks, flats or other defects are picked out with the aid of a magnet.

Balls used in annular bearings must be of absolutely the same size in order to give satisfactory results. If they are not, the larger balls will support all the load, with the result that these balls will soon fail and the bearings be ruined. Automatic gauging machines are used for grading the balls according to size, for balls up to and including 3-4 inch in diameter. These machines separate the balls within a limit of 1-10,000 part of an inch, balls within this limit being considered as of the same size. These automatic gauging machines receive the balls in hoppers, the balls leaving the hopper one at a time and running very slowly down an incline over a pair of accurately set blades of predetermined angularity. When each ball reaches a certain point in the runway, it drops between the blades into a tube which conducts it to the proper storage compartments. Balls larger than 3-4-inch diameter are inspected individually by micrometers of remarkable precision. These register ten-thousandths of an inch and the inspector is able to divide the measuring units into halves and quarters without error or difficulty. All gauges, micrometers and standard balls are regularly standardized by the use of measuring blocks in a special department devoted exclusively to this work. Great care is taken to see that standard balls and production balls are gauged at the same temperature, so that the heat expansion and variation is taken care of. After this inspection, all "Microchrome," or first-grade balls are guaranteed to be accurate in sphericity to .0001 inch and all balls in a box are guaranteed to be within .0001 inch in size.

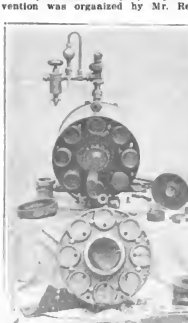
Several methods of mechanical counting have been developed which have proved entirely satisfactory. Balls up to and including one-half inch in diameter are put into the hopper of the machine, which lets them fall into a tray which holds one hundred balls. As soon as the tray is filled, it is withdrawn, and the balls emptied into a box, this process being repeated until the desired number have been counted out. Larger sizes are allowed to run from a hopper into several parallel grooves in a long board. The balls run into the grooves at one end of the board, and as soon as the grooves are filled to a predetermined length, depending upon the ball size, the balls are allowed to run out at the other end and the process repeated. Large balls are counted by hand, care being taken not to touch them with the bare fingers. After counting, the balls are immersed in a solution of rust preventative, after which they are packed in cartons lined with waxed paper and these packed in substantial wooden boxes for shipment.

The Research Laboratory

It is obvious that in the tonnage manufactured each month which has to meet such exact requirements as balls for use in high-grade annular bearings, the greatest care must be taken in the selection of raw materials and in conducting each step in the process of manufacture so that the balls produced will pass the inspection department. It is necessary that the balls not only be absolutely uniform in size, but they must also be of uniform hardness and strength. Both the preliminary and final steps in the manufacture of Hoover balls take place in the physical-chemical testing laboratories maintained by the company. The first step governs the quality of every pound of steel, brass, aluminum and other ball material received from the mills; the last is a super-inspection made on every lot of finished balls to see that the rigid standards of the production-inspection department have been maintained.

All Hoover steel balls are produced from one grade of steel, except that the chromium content of the metal is increased proportionately as the size of the ball is increased.

When the raw steel is received from the mill its composition is carefully checked by chemical analysis, in accordance with its specifications. The second step consists of an ocular examination for surface imperfections. In this test the steel is etched with hydrochloric acid, and if seams of appreciable depth are present, the material is rejected. Brinell hardness tests are made on all wire used for ball purposes to insure the final step in the raw material tests. Samples of the stock are heat treated and fractured to determine whether a correct, uniform, velvety fracture results. If the surface is decarbonized, the material is rejected. Tests are made here also of all the other materials which are used in the processes of ball-making, even the oil being tested to discover if it contains any acid which might injure the surface of the balls.



All of which goes to show that the simple process of making a round ball is not so simple after all.

Something New in Steam Engines

Write for Your Copy of

INVENTORY VALUATION

For Federal Taxation and Banking Purposes

Free on Request

FEDERAL Income Taxes are now engaging general interest. It was not strange, therefore, that when we published an authoritative discussion of Inventory Valuation in a recent issue, that there should have been a demand for copies which exhausted the supply and required us to prepare reprints.

The article was an extract from an address made by William M. Lybrand, President, National Association of Cost Accountants, before the January meeting of the Detroit Chapter of that Association.

The opinion and judgments of a specialist and unprejudiced observer on this important topic is presented. We want every banker, manufacturer, accountant, attorney and merchant to have a copy, which is why it was reprinted in booklet form for general distribution.

Inventory Valuation will prove helpful to those who seek or give credit, plan for the future or are concerned with the preparation of Federal Tax returns.

It summarizes principles of valuation that have stood the tests of time and that are governing in the present conditions.

Copies will be mailed free on application to

—*on being in two places at the same time*

You're wondering how you can crowd more business into one day.

You can't hold back the hands of the clock but---you *can* be in two places at the same time.

Sure you can!

You can't hold father Time

Long Distance Telephone Service enables you to sit comfortably in your office and *talk business* with customers *in another city.*

Instead of wasting time going to see an out of town prospect when it is simply a matter of "follow-up," why not let Long Distance help you?

In this way, you keep your finger constantly on the pulse of potential buyers, yet reserve full time for closing deals.

Call *up* "future prospects" and then call on the "live" ones. That's the system---and you'll find it a good one.

You'll find Long Distance Service prompt and efficient. Connections are made quickly. Conversations are readily carried on in an ordinary tone.

Tell the world

Take advantage of this modern service that doubles selling time.

Make part of your "calls" via Long Distance Telephone.

Spades Are Trump; The Purchasing Agent Deals

Which Is Another Way of Saying That Business In Motor Materials Hereafter Must Be Dug For And That the Plant Buyer Is Going to Be Critical

By F. W. HERSEY

FOR more than a decade the main problem in the automotive industry has been one of production. Stimulated by a constantly growing demand, manufacturers have accomplished truly ramarkable results in rapid-fire, quantity output, so that the opening of 1921 found the United States with more than 5,000,000 motor vehicles in daily use and a maximm production power of approximately 3,000,000 cars annually.

The manufncture of 2,241,000 passenger cars and trucks, the 1920 prodnction, called for plant facilities and buying power theretofore unbeard of in the whole industrial world. The expansion of plants, their equipment, the trailing of men and their assignment to duties, the purcbase of parts, materials, accessories, machinery, sbop equipment and supplies, called for genius in organiation, daring financial operations and vision of great breadth.

That the industry had all these, no one will deny. If the builders of this industry were weak in any one of the factors mentioned, it must have been vision, judging by recent events. Possibly this vision was just a trifle out of focus. At any rate, the unexpected happened in spite of genius, courage and vision.

Mistakes Brought Into Bold Relief

During the 10-year period the progress of the industry had been so steady, its development apparently so sound and the future date so insistent that the possibility of a reaction seemed so remote as to be negligible. Nevertheless reaction came, demand ceased and plants closed down. The cause of the sudden cessation bas been given considerable study by automotive executives, not because they were curious to learn why the public stopped buying cars, but rather for the purpose of deciding upon what basis to reconstruct their somewhat shattered conceptions of what constitutes sound manufacturing policy.

Some of them have come to the conciusion that the industry has emerged from the period of development and production into n new and indefinite period of intensive merchandising, and therefore of revised production methods and buying policies. Before arriving at this view, however, it is more than likely that retrospection brought into bold relief a few of the mistakes horn of an optimism that was in renlity a distorted mental vision.

For quite a time following the close of the war, buying for the industry was as hectic and unsound as was that of the prosperity-mad public. Price consciousness disappeared in the competition for available materials in a market as unstable as a Mexican jumping bean. Management succumbed to reports of actual and potential sales.

The production manager ruled supreme, while the purchasing agent became only a puppet in the conrt of the great god "Get." Whatever bargaining shrewdness be possessed won little recognition; for in the final analysis, what was wanted was materials, parts and accessories, not the genius of a Shylock. The man in the executive chair who viewed the world through a "field glass" imagination was inclined to become impatient with the purchasing agent who insisted on peering through the wrong end of the telescope.

John C. Howell, a purchasing agent for a large concern, speaking at a New York meeting recently, said:

"Too much profit is as bad as too little, since the insidious effect of large profits often invites risks which the sane and conservative man would avoid, breeds recklessness in expansion by unwarrantable increases in overhead, and thereby imposes a burden which cannot be speedily unloaded when the inevitable time for contraction arrives. Loose business methods only succeed in times of war when all goods are in great demand and costs become secondary and even trivial."

It was this unprecedented flow of sales and profits that distorted the vision of management. Loose buying was one of the results of the orgy of profits and an inflated mental attitude. The best illustration of an inflated mental attitude is offered in the report on estimated passenger car production for 1920 compiled from statements made by the sales departments of the manufacturers throughout the country. When these authorized statements were totaled, they placed the passenger car production alone nt 7,000,000 vehicles.

A commercial reporting agency which collected the estimates cut the figure to 3,500,000, or 50 per cent, before sending out its report. One purchasing agent the writer knows very well, cut this estimate to 2,000,000, and the actual passenger car production was 1,906,000. Had the industry's purchasing organization believed the sales department and bought on a basis of 7,000,000 car production, inventories would have well nigh wiped the business out of existence. We assume such a report was for public consumption only.

Certainly the industry did not believe its own exaggerated reports, nor did it endeavor to buy and manufacture on any such scale. The point we want to bring out is that this inflated mental attitude has and is yet permeating every branch of the automotive and allied industries to some extent, with the result that the work of re-establishing the industry upon a new basis has not really made any headway.

Industrial prosperity is not builded upon finely turned phrases or the predictions of self-appointed prophets. Its foundations have been, are and will continue to be consumption and production, two interdependent factors. Consumption of manufactured product can be cut any time the consuming public decides to do without the product. The inevitable result is a shrinkage in production.

At this time consumption is curtailed; consequently production is restricted. It is the belief in some quarters that it will take five years for the industry to recover from this shock. Other opinions favor three years. But whether the industry recovers tomorrow or in 1926 there is one thing certain, two functions in the business are about to undergo a shake-up. One is production and the other is buying.

Two Expert Opinions

In an article in System recently F. A. Seiberling, president of the Goodyear Tire & Rubber Company, wrote:

"My own experience teaches me that really sound business is founded on buying and manufacturing. It is perfectly true that if you know how to buy and make, the world will beat a path to your door. We use selling and advertising to make the path a road."

A General Motors official is quoted as having said:

"We have a long period of readjustment ahead of us. In the past the margin of profit has been big enough to allow laxities. In the future competition will be so keen that every organization to survive cannot have any division as important as the materials division inefficiently run."

Digitized by Google

It is with buying for automotive production that this article has to do. An effort has been made to get the viewpoint of the purchasing agents of the motor car manufacturing district of the Great Lakes district, comprising notably Michigan, Indiana, Illinois, Ohio and Wisconsin, on the buying policies they are likely to follow, the type of concerns which will get business and those whose past practices in a flexible market have given them a "black eye."

There are few industries throughout the whole nation that are not in some way interested in the progress and success of motor car manufacture. Its influence has spread to every corner of the country. The temporary stagnation of this industry has affected seriously many other industries, and indirectly, though not as seriously, affected others. All industry is watching the automobile barometer for signs of returning prosperity.

We have chosen to discuss only one small religion of the United States for reasons which will be explained later. Because Elwood Sampson, public relations director of the National Association of Purchasing Agents, who has just returned from a trip through the five states already mentioned and knows more of what the purchasing agents are thinking than any other man, we have asked him to explain the situation. His review follows:

"The purchasing agents of the motor car industry are doing more than sitting comfortable and not ordering. They are analyzing markets and all the various factors which influence market trend. They are studying the concerns who have sold or want to sell them goods. They know what they want, when they want to buy, and how much they want to buy. Like any other business man, they instinctively resent any attempt to dictate to them just how they shall run their end of it. Accordingly, the continuous exhortations of 'buy now' act exactly the opposite of what these various firms expect. These 'buy now' exhortations sound to all purchasing agents like a man in such a panicky state of mind that he has lost the power to reason clearly.

"Hard luck stories or begging for orders produce absolutely no concrete results, for business and charity do not mix. Granted that a salesman makes a business-like proposition to a purchasing agent, this alone is not sufficient to get an order. For, more than ever, purchasing agents will make it a point to know the kind of concern who is making that proposition—what is its financial responsibility, whether its past record is a clean, honorable one; or whether it is such as to make any responsible buyer afraid to have business dealings with it.

"The purchasing agent today is not a man who merely considers price and delivery, as is still so widely believed in the business world. In addition to all the factors which are of direct concern to him professionally, he considers the general business welfare of his company. And, accordingly, while it might be to his immediate advantage to deal with some one firm whose general business policies are destructive, he feels he must protect the best interests, in the long run of his own company.

"The purchasing agent knows what he needs for his car. He knows that his company is facing keen competition for some time to come. It is therefore up to him to more than do his part by getting the proper quality of material at such a price as to give his own company an advantage in the competition ahead. In general, he will not expect to place business at prices below the irreducible minimum. In some cases, however, he will expect business, if placed at all with certain firms, to be placed at a monetary loss to them as a reminder that sharp practices followed by them in the past do not pay in the long run.

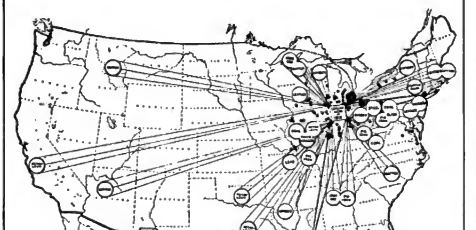
"There is not a high grade professional buyer in the country who does not know that deflation must be completely brought about before the market will swing about again. All of the talk in the world to make purchasing agents believe anything else is falling on absolutely sterile ground. With the purchasing agent deflation means more than a drop in material prices. It means a deflation in the mental attitude which business men have come to take toward business costs and business profits.

"This deflation is one thing which is being particularly watched day after day. The purchasing agents are waiting and wondering how soon the business men of the country will bring themselves to admit that prosperity is not a bubble in the air which they must keep blowing in order to keep it from dropping and breaking; but instead that prosperity must rest upon a solid foundation which is the land—either that which grows on it or which is mined from beneath the surface.

"In watching this deflation for the psychological moment to start a real buying movement, the purchasing agent is studying each class of business—the manufacturer, wholesaler, retailer and the land owner. At the present moment purchasing agents in general recognize that in many of the raw metals and textiles, complete deflation has taken place, with the exception of the elimination of firms unable to do business at low price levels. This is particularly true of copper, tin, lead and zinc, but deflation in rents is not more than 5 per cent of what we feel must take place. The sooner that this process can be completely brought about the sooner are we going to start in a long pull through a cautious buying movement. Buyers do not hesitate to come into the market when the long swing tendency is upward. But they continually hold back and buy only for immediate day-to-day needs as long as they know that the bottom has not yet been reached.

"There is business in the automotive district through which I have traveled. The country itself has not shut down and never will so long as there is human life and human needs to be supplied. The motor car industry has a certain important part to play in the essential work of the nation. But no man or no firm is going to get this business who adopts the attitude of just sitting back and waiting until the high tide of prosperity reaches us again.

"He must first put his own manufacturing house in order; get rid of all of the excess manufacturing costs which have crept in during the last six years; tone up his organization to the point where it has true manufacturing ability in the face of keen competition. When these things have been done it will be time to send out his salesmen with their very best propositions. For with the professional buyers today, personality will not count nearly so much as it has in the past. Selling talk is the thing which every buyer is trained to disregard. The salesman must have the goods to meet and be able to present a real proposition in every sense of the word.



"I know that the majority of business men will feel that the purchasing agents are demanding too much in what I have outlined above. Be that as it may, there are certain firms who are getting business every day and who are running as high as 90 per cent capacity, because they have been wide awake enough to get the jump on their competitors by doing the things I have outlined above. Therefore it is certain that those who are still asleep either to wake up and show the real American fighting spirit, or else close up shop entirely."

From this view of the situation one may draw the inference that there will be no welcome on the doormat for the concern which, to pursue the glittering golden stream of profit in the epileptic market, feigned inability to respect contracts and then sold through concealed brokers on the theory that the purchasing agents would never "get wise" to them. Likewise the S. R. O. sign will be out for prophetic salesmen, mendicants and glib talkers with white elephants to park in some "easy mark's" backyard.

We have an estimate that materials and parts on hand in the automotive industry, if balanced, would last through May of this year. But as they are not balanced, every plant will be in the market from month to month for a limited amount of material, but it will be very about buying more than 60 days' consumption.

When Mr. Sampson discusses "selling right" he probably has in mind some advantageous

Flying Ten Miles on a Gallon

Most Recent Developments in Airplane Construction In Detroit; "Ships" Even Becoming Rivals of Trucks

—Copyright, 1926, Underwood & Underwood, N. Y.

TWO VIEWS OF THE STOUT "BATWING" TYPE OF INTERNALLY-TRUSSED AIRPLANE

By WILLIAM B. STOUT

THE LAST FEW MONTHS have brought great changes in the possibilities of the airplane industry. New figures of performance and manufacturing cost, together with operation cost, are lower than anything that the airplane enthusiast, himself, imagined could be possible a year ago.

These things have a vital bearing on Detroit, and unless this city awakens very shortly to the real industrial possibilities of the newer types of aircraft, some other locality will be well on the way toward controlling this new industry.

In airplanes of the war-time period all plane structure was carried out in the air to resist the wind, so that the planes of that period might be compared to motor boats having the keel and ribs outside of the hull and resisting the water, instead of inside, where they belonged.

The new types of airplanes are "internally-trussed"; that is, they have all of their structural parts inside, out of the wind, so that no horsepower is wasted in shoving useless resistance through the air.

This means that, with the new planes, a 200-horsepower engine carries the same load at the same speed as the old ships accomplished with 400 horsepower, but for twice the distance without having to come down.

This means that the new "internally-trussed" planes with a load of six people can make more than 10 miles on a gallon of fuel, and can be operated at an upkeep cost on a ton-mile basis comparable to that of a motor truck in long distance work. For distances over 300 miles, one is even now able to transport goods by airplane cheaper than by a motor truck of the same capacity, and naturally in far less time.

The old type biplane was also a very fussy production problem, requiring some special, select materials and workmanship, whereas the new planes, of very much stronger design and of all metal construction, are made of easily-obtained material, and with far less skill of labor required.

The announcement by the Aviation Country Club of Detroit that the Pulitzer Trophy Airplane Race would, in all probability, be held in Detroit next year has more than a usual interest, as this race will mean not only that Detroit will enjoy a spectacle of the most modern type of contest, but that those who wish may at the same time educate themselves to the real possibilities of air travel, as a solid, industrial force.

It is not generally known in Detroit that the most advanced types of airplanes yet produced for our Navy are being constructed in Detroit, and were designed by Detroit engineers. These planes will be fitted with Detroit-built engines, and although their characteristics and performance cannot be stated, as they are for government work, yet they represent the "last word" in the design of aircraft in any country.

It is very probable that more than $2,000,000 worth of airplane business will be handled in Detroit during the next year, these planes being both government and commercial craft.

In line with development of the new types of airplanes, the most recent development of the type is being built in Detroit. Only recently, flying tests were secretly carried out at the Packard Aviation Field on the Stout "Batwing" type of internally-trussed airplane, an all-veneer construction embodying some very advanced features, both of aerodynamics and structure.

The plane itself, as built at the Stout Engineering Laboratories, Inc., in Detroit, is an all-veneer job, even the wings being covered with this material.

In general principles, the plane, or "ship," as it is colloquially called, resembles a high-class motor car sedan, fitted with wings. This totally-enclosed type, built for three passengers, takes the airplane a considerable step beyond anything developed during the war, in that with this plane, one has real comfort and quietness, and yet a very remarkable speed range.

Whereas the ordinary airplane must land at about half its maximum flying speed, this plane can land at one-third of its maximum flying speed, and yet without any of variable wing curve features. It is a monoplane, as are all the newer experimental types, and, with a landing speed of approximately 42 miles an hour, may attain a maximum speed of 125.

The extreme safety of the type, and the comfort connected with travel in it, should be a very great advantage in all varieties of commercial work; whereas the fact that it operates on a gasoline economy of 10 miles per gallon, shows that there is a great deal of difference in airplanes on operating cost.

The Stout Engineering Laboratories, Inc., are now building planes of all-metal, capable of carrying a two-ton load, or the equivalent of sixteen passengers and baggage and five hours' fuel, with a maximum speed of 125 miles an hour. The cruising speed, even with full passenger load, would be about 110 miles an hour.

All-metal construction of a type entirely developed in Detroit (and a radical advance over either the foreign or American construction) again adds a large factor to the commercial value of the airplane, due to its weather-proof quality and the extreme strength and durability which can be obtained.

The Stout Engineering Laboratories, inc., are also building some large planes for the Navy in all-metal construction.

The Verville airplane which won the Pulitzer Trophy Race this year was designed by a Detroiter, Alfred V. Verville, now employed by the Government at McCook Field, Dayton, Ohio. It is rumored that certain Detroit interests are anxious to locate him again in Detroit in preparation for next year's contest, but under civilian auspices.

The sales field for airplanes seems to be almost unlimited, even at present, where planes of proper operation cost can be produced. The market includes not only Army and Navy requirements of different types, but a large number of aerial mail routes, aerial freight and passenger lines, particularly on the coast, and planes for carrying ore and supplies to and from mines, etc., in inaccessible localities.

The future of the airplane industry in Detroit will entirely depend upon the attitude taken by Detroit business men and financial interests toward the new industry, and on the quality of management which goes into its progress in connection.

FINANCING COPPER EXPORTS

Plans for financing the sale of export purposes of 400,000,000 of the 600,000,000 pounds of surplus copper in the American market were made public in New York last week with the announcement that the product was pledged as security for $40,000,000 of 8 per cent notes of the Copper Export Association to be offered for public sale by a banking syndicate headed by the National City Company and the Guaranty Trust Company of New York.

This is said to be the first public loan made in this country to be secured specifically by a certain amount of an essential commodity, as well as the first big movement by American companies to take advantage of the opportunities offered under the Webb Act to invite public participation in the financing of foreign trade.

Rosenheim Visits His Banker

[*From the Timken Magazine*]

"WELL the Greeks they eleeted that feller Constantine as King again and right away he wants to borry thirty or forty millyun dollars," remarked Meyer Goldman to his friend Max Rosenheim, proprietor of the Scoteh Woolen Mills, High Grade Men's and Boys' Clothing.

"Yes," replied Max, "and I bet he gets it, with mebbe nothing for security but the Athens city hall and a coupls lots in Crete. One of the easiest things what a King can do is to go out and borry money on his business prospects, and he don't have to morgidge his throne or leave his crown in the bankers' safe. They just say, 'Good morning King, how is Mrs. King and all the little Kings, and will you have it all in big bills, or part gold?' But when a business man needs a little capital and goes to one of them bankers he must give a detailed statement of his commercial history since 1882 and show that the fillin' in his teeth is not less than 22 karat. When you put money in a bank, all the security you get is a pass book and a ten-cent calendar, with a notice that if your account averages below a certain amount they don't want your trade. But when you want to borry a little money they take out the interest in advance and probly report to the police that you're a suspishus character and will need close watchin' for ninety days."

"But, Max, a bank makes all its profits from loans, so it stands to reason that they are glad to loan money on good security."

"Meyer, a banker is the only business man I ever saw what hems and haws and hesertates when he has a cash customer ready to pay him a profit on his commoderty. When a man comes in here to buy a suit of clothes I use the best salesmanship what I know to get him to take it, but when a banker's customer wants some o' his goods, the banker usually has nine or ten reasons why he can't make the loan, but finally is persuaded to accept a ninety-day note and an apology for botherin' him."

"A banker has gotter be careful, Max. If he makes too many mistakes, the bank examiner will be after him."

"Yes, and so has a clothing dealer or an ottermobile dealer or any other kind of a dealer gotter be careful too. If he makes too many mistakes the sheriff will be after him. The Federal Reserve Board it tells the bankers to be careful and not overload themselves with ottermobile paper, and instead of usin' common sense and makin' loans accordin' to good judgment, the bankers freeze up and say an ottermobile is a luxury and right away shut off on all loans to the dealers. Then we have a panic and anybody who wants a loan is as welcome in a bank as a burglar."

"I notice you are makin' a twenty per cent reduction on all suits, which still leaves you an average of eighty per cent profit, and with the good business what you have, you ain't got to borry money. So I guess, Max, you're lucky."

"Meyer, like all the rest of the yumerists, you think the clothing dealers are a lot of profiteers, and when you come in here last summer a-wearin' them overalls, I suppose you thought you was helpin' in bringin' down the cost of livin'. I make more profit in sellin' overalls at that time than I make in a year before. When the slump comes it ketches me with a line of goods what I bought at peak prices and the reductions I make don't get me even on ackshell eost, not countin' the overhead. Sure I have to borry money."

"Well, I bet the bank was glad to let you have it."

"If they was glad they concealed their joy so you couldn't see it. You know, Meyer, I earry an account at the First National where Abraham Fisheorn is president. When I go in there the other day old Abe rushes up to me with his hand outstretched and greets me like a long lost brother. 'Good Morning, Mr. Rosenheim,' he sez, 'glad to see you. It look like we are goin' to have a great revival in bizness. Factories are reopenin' everywhere, stores are crowded with buyers, and we can expect a steady, sensible,

(*Continued on Page* 18)

(*Continued from Page* 6)

deals made recently by automotive plant buyers. For instance, the scale on pig iron at this writing is $30 and up per ton, but at least one buyer has obtained a four months' supply at $22, and could have had more, but he wouldn't take it. Another buyer accepted copper at 11½ cents a pound, the market being 13 cents at the time.

Earlier in this discussion the purchasing agent was represented as a shrinking violet during the reign of profits. Today it may safely be assumed he is a glorious sunflower. His stock will continue to go up as he shows management a few tricks he was not allowed to use before. The reason for this change is illustrated in two Detroit plants.

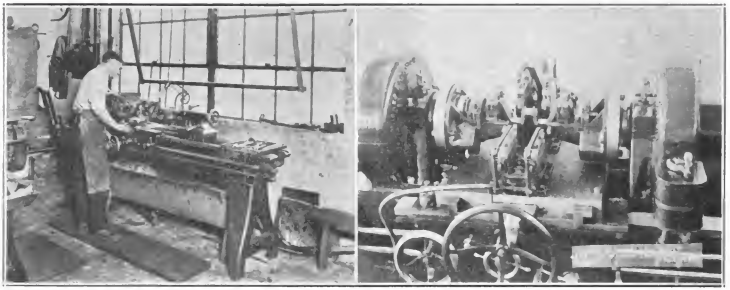
One had a purchasing agent trained up to the mark. He was partial to pig iron and studied that market from every angle. In November, 1919, he contracted for pig iron at $29 a ton for a period to end in October, 1920. All efforts to coax him to lengthen the contracts failed. He said the market would break by October, 1920. Between November, 1919, and October, 1920, pig iron ran up to $50 a ton, and maybe this purchasing agent wasn't "sitting pretty!" The break came as he predicted.

In another plant where the president attempted to be everything from office boy to chief executive, and included in his special duties that of purchasing, "sales pirates" loaded him up with pig iron at $50 a ton for the whole year from March, 1920, to March, 1921. Pig iron has slumped to $30 a ton, but Mr. President has poor consolation in viewing his pile of pig iron. He had no time to study market conditions, and undoubtedly he was fired with that wonderful optimism that is as uncertain in its operation as the prohibition law.

The bulk of materials, parts and accessories sold to the motor car industry throughout the country is disposed of to plants in Michigan, Indiana, Illinois, Ohio and Wisconsin. Outside of New York and Pennsylvania, no other states in the Union produce anywhere near as many trucks and passenger cars as any one of the five states mentioned. Consequently the greatest selling effort of parts makers and materials dealers is directed at these five states.

Michigan as a Market

In 1910 Michigan produced 95 per cent of all the motor vehicles manufactured in the United States. Since 1910 motor vehicle production has increased in this state 932 per cent, while in that 10-year period 11 manufacturers of motor cars and trucks have gone out of business. Against an increase of 932 per cent in 10 years we have the insignificant reduction of 35 per cent in car production in 1920. The Detroit district alone, which includes Pontiac, Flint, Lansing and other Michigan cities in which the automotive industry is represented in a large or small way, produced 1,848,000 cars in 1920—more than all Europe turned out. The total production for the year was 2,241,000 motor vehicles, 1,906,000 being passenger cars and 335,000 commercial cars, which when compared with Michigan production gives this state 83 per cent of the total output.



According to the National Automobile Chamber of Commerce report, there are 260 manufacturers of passenger cars and trucks in the country. Of this number, 90 build passenger cars and 170 trucks. The increase in new truck manufacturers has been much greater than in passenger car. The total investment in motor vehicle manufacture in 1920 was $1,502,302,862. The greater part of this amount is invested in properties in the five states mentioned, and no account is taken of tractors and other gasoline-driven farm machinery, the bulk of which is manufactured in those states. In 1919, the big year of the industry, the value of parts and accessories sold reached $621,722,048, and that of tires sold to car manufacturers alone was $165,000,000.

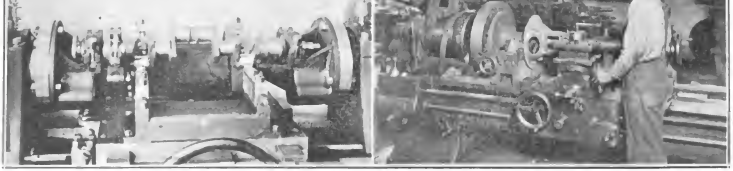
The Lathe Family

This Mainstay of the Modern Machine Shop Traces Its Ancestry Back to Bible Times

In Figure 1, at the left, is shown a Monarch standard engine lathe in an Oldsmobile service station, and in Figure 2, at the right, a Wickes Duplex crankshaft lathe arranged for turning and filleting two pairs of pins for the Chevrolet "4-90" crankshaft. It is equipped with electric rapid traverse, turning tools in front and filleting tools in the rear.

By HOWARD CAMPBELL

THIS is an age of extraordinary mechanical achievement — so extraordinary, in fact, that new discoveries and inventions of the greatest importance have ceased to be regarded as remarkable and are accepted as complacently as is the morning coffee, and as quickly forgotten.



Practically everyone is acquainted more or less with the intricate machinery of the automobile. Abd the huge number of motor vehicles normally produced daily in the factories of this state are a source of pride to the people of Michigan. Yet there are comparatively few who have any knowledge of the wonderfully efficient machinery which has been developed in order to make possible this vast production.

According to history, man has always used tools of one kind or another, although it is probable that the first tools were simply stones which were used equally well in the grinding of food and the killing of prey. The first real tools were of the crudest variety, and although hand tools were improved as the centuries rolled on, undoubtedly man was quite civilized before the first mechanical tools were contrived.

The first machine of any kind was the "potter's wheel," spoken of in Holy Writ, and which was the earliest and simplest form of turning machine. From this machine was developed the lathe, in which pieces of wood could be "turned," or rotated, while a hand tool was removing the humps and corners. From this it was only a step to the metal turning lathe, which was the forerunner of all modern machine tools. The lathe undoubtedly is the most important factor in the equipment of a machine shop. Practically all of the running parts in any kind of a machine are round, and most of them are produced either in the lathe or its offspring, the screw machine.

The wheels under the street car, and the little trolley wheel which spins along on the wire overhead, were both turned in the lathe, as are also the driving wheels of a locomotive. Automobile crankshafts, pistons, gears, pushrods, and very often flywheels, are given the symmetry of the perfect circle and turned to the proper size, in the lathe.

The importance of this machine in modern manufacture is evidenced by the fact that the Ford Motor Company has approximately 1600 lathes in its main plant, Dodge Brothers has approximately 600 lathes in its plant, the Studebaker Corporation has 270 lathes in its largest Detroit unit and various other plants have proportionate numbers. The Ford Motor

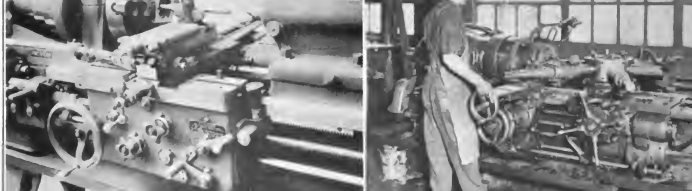

Figure 5, at the left, shows the operation of boring out a dis on an American lathe, using a Universal Relieving Attachment. Figure 6, at the right, shows an operative boring, reaming, tapping and facing a pinion carrier on a Libby turret lathe in a Studebaker plant.

Company has a school for apprentices which is fully equipped with the latest and best machinery for both production and tool-room work, included among which are approximately 80 special Reed-Prentice geared-head engine lathes, each driven from a motor in the base under the head. Other makes of lathes are being added as the shop is being enlarged, so that the potential toolmakers and executives may become familiar with a variety of types.

Two General Classifications.

Probably a greater variety of operations are performed on the lathe than on any other machine, and because of this fact, lathes are divided into several different classes, those in each class being especially designed for the work which they have to do. Practically all lathes come under one of two classifications: engine lathes and turret lathes. Engine lathes were originally intended to perform operations on work suspended between centers, but the development of the chuck removed the necessity for centers in many cases. The turret was finally developed which could be placed on the the bed of the lathe, this turret being made to hold a number of tools which could be brought into play one at a time, thus making it possible to perform the operations of drilling, boring, reaming and tapping, which obviously could not be done while a piece was swung between centers.

Various types of engine lathes possess peculiar characteristics, by which they are named, such as the gap lathe, wheel lathe, bench lathe and so forth.

The gap lathe is so named because the bed of the machine is divided near the headstock, leaving a gap which will admit of swinging a very much larger piece of work in the machine than a lathe of this size would take if the bed were not divided.

Wheel lathes are used principally in railroad shops, being designed and built especially for turning the driving wheels of locomotives. Drive wheels are not turned singly, as practically all other wheels and gears are. The two wheels are pressed on to the axle, and this whole piece is put into the machine, with the result that after the wheels are turned they are absolutely true with each other.

A bench lathe, or precision lathe, as it is coming to be known, is used for very small, fine work, and is used principally by toolmakers, jewelers, manufacturers of instruments, and others whose work is exceedingly fine and precise.

In Figure 1 is shown a standard Monarch Engine lathe which is being used in this instance for repairing a crankshaft. The shaft is swung between centers, being driven by means of a "dog" which is clamped on to the end of the shaft. This "dog" has a bent "tail" which fits into the slot in the face plate, thus forcing the shaft to turn as the face plate revolves. For many years this was the customary method of driving work in a lathe, but modern production methods have forced the development of machines into which the work can be clamped without the necessity of using a "dog." In the earlier days of the automobile business, the production of a crankshaft was a comparatively slow and laborious process, in order that the crank pins and bearing might all be turned in proper relation to each other, a set of iron blocks known as "shoes" were used. A "shoe" had a hole through the center, through which the end of the crankshaft could project, so that as the main bearings were turned, the shaft swung on its own center. In the same side of the block were two more centers, all three being in line, and each outer center being as far from the middle one as the distance from the center line of the shaft to the center line of the crank pins. When the blocks were placed on the crankshaft the shaft and blocks were lined upon a surface plate, so that the centers in the shoes came in line with the pins of the crankshaft. Then as the different

Turning Hudson Super-Six piston pins on a Porter-Cable lathe. Two hundred pins an hour is the production of this machine.

sets of bearings and pins were turned, the crank and shoes were transferred from one set of centers to the other. Only one tool at a time was used, the turning, filleting and facing the cheeks being done by separate tools.

The central section of a modern crankshaft lathe is shown in Figure 2, which is a Wickes lathe containing a crankshaft turning fixture such as is used in the shops of the Chevrolet Motor Company and many other automobile concerns. A crankshaft is put into this fixture and clamped in without any preliminary gauging. Then the two tools shown at the front of the machine are fed in, turning two pins at once. The tool block strikes against a stop when the pins are turned to the proper diameter. This block is then withdrawn from the work and the two tools at the back of the machine are fed in, forming the fillets. The whole operation takes only two or three minutes, after which the shaft is removed and placed in a similar fixture on another machine, which is so aligned that the other set of pins can be turned in a similar manner.

The Hudson Motor Car Company uses similar machines and fixtures for turning Super-Six crankshafts. The company uses three of these lathes with a set of tool blocks and a special fixture for each one of the three pairs of pins, turning one set on each lathe. A wide-nosed tool in front is used for turning, and the filleting tools are in the rear. These three machines produce approximately 100 crankshafts a day.

A Record Lathe Order

The Lodge & Shipley Company builds a machine of approximately the same size and strength which is used for practically the same class of work. The Buick Motor Company was the first concern to adopt the method of turning two crankshaft pins at one operation, two at another, and so on. The company has approximately 150 of these Lodge & Shipley lathes, 136 of which were ordered at one time. At the time these were purchased, this was the largest order for lathes which had ever been turned in at one time by a single firm. They are mostly of the 18-inch size and are fitted with multiple stops for length and diameter operations, so that once these stops are set, the desired lengths and diameters can be reproduced without having to measure each piece of work. The Buick company uses these machines also for turning bearings on camshafts.

The operation of turning two different diameters on a cast-iron transmission case in the Detroit Gear & Machine Company's plant is shown in Figure No. 4. In this instance, a Walcott lathe is being used, having an auxiliary

Michigan Corporation Laws Recodified

REP. GEORGE LORD, Detroit, has introduced in the House, at Lansing, the longest bill to be placed before this Legislature. It is bound in book form, contains 113 typewritten pages and codifies and amends all the corporation laws of Michigan. The bill was prepared by the Attorney General's department and represents a study and codification of about 1,200 pages of statutes covering corporation laws.

In brief, the more important changes made in the corporation laws by this bill are:

(1) Michigan corporations are permitted to issue stock without any fixed par value.

(2) Industrial stocks intended for sale or gift to employes of the company issuing them are legalized.

(3) The limitation on capital stock issues is removed so that a company may incorporate in Michigan for any amount.

(4) Trust agreement corporations, similar to common law trusts, are authorized, but are limited to holding church, lodge, labor union and other non-profit properties.

(5) Co-operative companies are required to file reports with the Secretary of State at least once every three years.

(6) Non-profit corporations are not permitted to capitalize for more than $500,000.

(7) Corporations not required by present laws to file their articles with the Secretary of State will be compelled to file a certificate showing their location and the place they have filed their articles, so that the state will have a record of all corporations.

(8) The date for filing annual reports is changed from the first of the year to July.

The bill repeals 95 present acts, and consists of 175 sections replacing 1,500 sections of existing laws. It covers commercial, co-operative, non-profit, church, college and fraternal corporations. It does not have to do with the existing laws governing incorporation of banks, trust and insurance companies, finance corporations, building and loan companies, limited partnerships, railroad corporations, harbor improvement, cemetery, burial or cremation associations, agricultural fairs, pipe line or waterway companies under the jurisdiction of the Michigan Public Utilities Commission.

The section permitting companies to issue non-par value stocks does not allow the issuance of this kind of stock only, and such stocks cannot be given as bonus with other stocks, but must have a value not less than $1 a share. The non-par stock might be the only common stock issued, in conjunction with preferred stock of fixed par value.

Faithful service to a corporation could be rewarded by issuance of industrial stock to employes by the terms of the proposed law. The limitation of capital stock for Michigan companies to $25,000,000 has compelled many larger concerns to incorporate in other states, thus losing much revenue to this state. Such limitation is removed altogether by the bill.

For the purpose of preventing fraud the limitation on stock of non-profit companies would be made. It is pointed out that under present laws hunting, fishing and similar clubs are organized as non-profit concerns, buy up large tracts of land ostensibly for the benefit of club members, but in reality, to hold the property under exemptions of non-profit laws and later sell at profits.

At present many types of corporations file their articles with county clerks, probate judges, etc., and the state has no record of them. The new bill would compel a concise record of these concerns so that the state department would be the center for a complete record of them all.

Among the bills which have been passed by the Senate or House and are before the other legislative body, is one providing that trucks of one ton or more must be equipped with mirrors, and another granting cities of more than 50,000 population authority to bond for 8 per cent of their assessed valuation for purchase of public utilities.

Among the bills which have been introduced during the last week are the following: bill to require all lobbyists to register with the Secretary of State, giving the names of the organizations they represent, and barring them from the floor of the House and Senate while in session; heavier penalties for bank robbery; require each University graduate to pay $200 to the state during the five-year period following graduation; continuing for two years the Great Lakes Tidewater Commission; providing free peddlers licenses to former soldiers; removing the two-term limit on county treasurers.

The House has before it the joint resolution passed by the Senate urging Congress to pass the $100,000,000 appropriation granting federal aid for state highway construction, Michigan's share would be about $3,000,000 available during the next fiscal year.

D. & M. DEFICIT $152,654

The Detroit & Mackinaw Railroad Company reports a net operating deficit, after taxes, of $152,654 for the 12 months ended December 31, 1920, as against $90,292 at the end of 1919. The gross was $2,078,601, as compared with $1,687,342 for the preceding year.

Unsold Fords Being "Cleaned Up"

Marked Reduction in Cars on Hand Reported The Motor Magnate Gives Out Two Interviews

DURING the last ten days Henry Ford has given out two interviews, one to the New York Tribune and the other to the Detroit Times. The facts brought out of special interest are the following:

In the Detroit Times—Wages paid the men coming back to work at the Ford plant are not being reduced, but are the same as before the plant closed in December. A rotating system has been inaugurated whereby after a shift of men has been employed two weeks it will be replaced by another shift, which will work two weeks, to make room then for still another shift, thus enabling as many Ford men as possible to have partial employment. At present the married men and those with dependents are given preference. The one thing Mr. Ford needs most he said is lower steel prices.

"But what about financing the industry; have you succeeded in getting that $75,000,000 yet?" was asked by the Times.

"I didn't know we needed it until a few loan sharks came out and tried to tell us we did," Mr. Ford replied. "But I think we proved to a few of them that we could take care of ourselves."

In the New York Tribune—Mr. Ford denied that he had sought a loan of $75,000,000, or any sort of a loan, in Wall Street, and said that he was preparing to give financial assistance to towns and villages in which he expects to locate plants in furtherance of his plan to promote industry and labor away from the congested centers.

Mr. Ford said that the company closed its works in December to dispose of stocks on hand, which included cars and materials, representing between $15,000,000 and $20,000,000. During 1921 the company intended to do comparatively as much as in 1920, when 1,250,000 cars were sold, but added that perhaps it would mean only 750,000 cars or 1,000,000 for this year.

The New York Times, which is generally regarded as conservative in its financial reports published the following on February 10:

"The Ford Motor Company, it was the expressed opinion in Wall Street yesterday, will probably obtain a loan within the next thirty days—perhaps within the next two weeks—despite the statements of Mr. Ford that neither he nor his company was in need of funds and was contemplating the arrangement of any financing, statements which were received with surprise by New York banks.

"Between now and the middle of March the Ford interests will have to raise some big sums. Loans, it is said, will be falling due within this period and in March the Ford Motor Company will reach its peak of requirements. Federal taxes are due on March 15 and will call for a large amount. The maturing loans will have to be provided for and the company will need new money to take care of its manufacturing requirements.

"It is not anticipated that Mr. Ford will experience any difficulty in arranging a big loan, so long as it takes the form of an issue of securities. These may be either notes or bonds, probably the latter. But it is considered as highly improbable that the banks, in view of the present credit stringency and the positive desire to cut down the volume of bank loans, would extend their line of ordinary credits to any great extent.

"The Ford Motor Company last year enjoyed probably the most prosperous twelve months in its history. Its net earnings before Federal taxes have been estimated at upward of $115,000,000, and after something more than $40,000,000 was paid to the Government, its net earnings were still in excess of $70,000,000. On such a statement it is believed that the company would have no trouble in marketing $50,000,000 or $75,000,000 in bonds."

The New York Tribune says: "The Street, however, disagreed with Mr. Ford's belief that he would not have to come into the investment market in quest of funds. The belief current was that within a fortnight or a month the Ford Motor Company would seek to raise funds through the sale of securities to the public. Taxes, maturing obligations and working capital are the needs which Wall Street men believe will attract Mr. Ford to this money center."

Some of the Ford assembling plants throughout the country are getting back into production. This is made possible, it is said, by the receipt of parts from the factories in Detroit and River Rouge. This is learned from news items appearing within the last few days in papers in cities where some of these plants are located. When Ford Motor Company officials in Detroit were asked for verification or denial, the answer was they did not know anything about it, nor could any information be given out on the subject.

The first of the assembling plants to re-open is the one in Cambridge, Mass., which, as far as is known, closed about the end of last year. The second factory to resume is the one in Buffalo, N. Y., which closed December 24, and which renewed operations on a four-day week basis, according to the Boston News Bureau, which adds that only about one-fourth of the usual force started work, but that the whole force was expected to return within the week. Furthermore, there was no reduction in the wage scale.

Referring to the Buffalo plant, the Commercial of that city quotes one of the local Ford officials as follows: "If all Ford branches were like this one, the Ford plant would never have shut down. We are plied high with orders, and once we get started we will do plenty of business."

The assembling plant in Kearney, N. J., is expected to re-open in a very short time, according to the Wall Street Journal, which in a recent issue says: "The Kearney assembling plant, which supplies part of the requirements of the New York branch, and which closed recently from lack of parts, is expected to reopen in about two weeks, when the Detroit plants will have resumed shipments.

"The New York branch of the Ford Motor Company, whose territory takes in New York, Connecticut and parts of New Jersey, reports business exceptionally good. Since August 1, 1920, the beginning of the company's fiscal year, business in this district is $2,500,000 to $3,000,000 ahead of the corresponding period in the previous year."

During 1920 approximately 10,000 Ford cars were sold by the 18 Ford distributors in Detroit Some of these cars were sold outside the city, since the Ford company changed its sales policy the latter part of last year, when all territorial restrictions as to dealers, territory throughout the country were eliminated. This year these distributors believe they will be able to sell 10,000 cars and even more if they can get them. However, it is the impression among a number of the distributors that they will not be able to obtain more than 66 to 75 per cent of last year's quota.

According to a number of dealers, the average daily output of Ford cars is now about 1,000. This estimate is based on the number of cars being delivered to them and according to

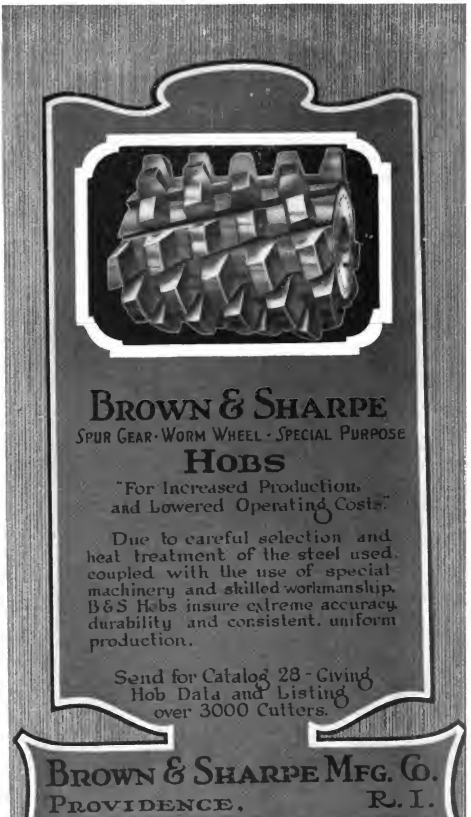
Digitized by Google

what they hear from other dealers. They say that they are not informed as to what is actually going on at the plant.

Sales by the Detroit dealers are better in a good many instances than they were last year at this time. One distributor stated that during the first eleven days of February he sold and delivered 32 cars, as compared with 48 during the entire month of February, 1920. Another distributor without giving figures said he had sold and delivered approximately 25 per cent more cars thus far this year than during the similar period last year. A third dealer said he had placed orders for 28 cars, all of which had been delivered except those ordered within the last 36 hours. This agent had sold 30 cars thus far this month, or nearly double of his sales during February, 1920.

The distributors state that cars are sold on the average 75 per cent on time and 25 per cent on a cash basis, which is just about the reverse of a year ago and before. Sales generally are made quickly, the prospective buyer knowing the prices and being interested only in knowing how soon he can get delivery.

It is the opinion of the local Ford distributors that within a short time the demand will come up to near normal. April, May and June they say, are the big sales months, and they believe from what they have been able to learn that production at the Ford plant will be at the rate of 2,000 cars a day or better by April and probably 3,000 before the beginning of May.



"From the little we dealers get officially in the way of what is going at the Ford plant," said one distributor, "we believe that the Ford Company with a reduced force will accomplish as much this year as it did last year, if need be. For instance, where 55,000 men were employed at the height of the 1920 season, we hear that 45,000 will be expected to do just as much this year. This is due to several important changes in plant operation, to greater efficiency and to faster work. We are told that the returning employes are given to understand that a greater effort is expected of them than ever before; that the easy-going and easy-living days of the war period must be forgotten and that owing to the very large number of men out of employment it is an easy matter to get as many employes as needed."

One of the distributors said it was quite possible that at the time the plant closed in December 125,000 to 135,000 Ford cars were unsold. It was on account of this condition, said this dealer, that the Ford company changed its sales policy making the whole country the territory for every dealer. This enabled those dealers who had many cars on hand to dispose of them to other Ford dealers who had none and needed them.

"I made one trip to a city in Ohio and got several car-loads because I could not get any cars from the factory in Detroit," said this agent. Another Detroit dealer said he had received cars from Ford dealers in Texas. As far as local dealers have been able to learn, it is not likely that there remains more than 20 per cent of the unsold Ford cars of December with the dealers throughout the country.

GRAND RAPIDS STREET RAILWAY

Gross earnings for 1920 of the Grand Rapids street railway were $1,804,293, but operating and fixed charges were $1,951,353, leaving a deficit for the year of $147,000. Compared with 1919, the gross earnings increased $232,151, but the gain was more than offset by greater operating costs. Total revenue passengers carried in 1920 was 27,813,220, compared with 26,307,032 in 1919. There was considerable new track work done during the year and nineteen one-man cars purchased. L. B. Cobb, New York, was re-elected president; L. J. DeLamarter, vice-president and general manager; W. E. Livingston, secretary and treasurer, and Charles Wygant, assistant secretary and assistant treasurer.

STANDARD PARTS' OUTLOOK

According to a report from Cleveland, the business of the Standsrd Parts Company is increasing and February is expected to show decidedly better than for several months past. It is believed that the trend will continue from now on and that within probably less than two months, Standard Parts will be again a very busy concern. Officials, however, no not think that the activities will near normal for some time to come.

MOTORS METAL'S NEW PRODUCTS

The Motors Metal Manufacturing Company, Detroit, is placing on the market two types of oil heaters of the 8-inch and 15-inch sizes which it will produce in large quantities and distribute through a selling company—which it controls—known as the Superior Stove & Stamping Company. This line of oil heaters is in addition to the automobile sheet metal parts such as hoods, fenders, gas tanks, etc., which the company has been manufacturing the last seven years.

TRIANGLE GETS A BIG ORDER

Further evidence that the automotive industry is distinctly on the mend is to be found in the announcement of the Triangle Motor Truck Company, St. Johns, that it has been given a contract for 3,750 of its trucks by the Attick-Shoecraft Company, Kansas City, Mo. Deliveries begin this month and 750 of the trucks are to be shipped this year. The contract means, according to Glenn B. Hiller, director of sales, that the company will have to increase its working force to at least 150 men and that the plant must be enlarged. The order will keep the Triangle concern busy for an indefinite period. In addition, Mr. Hiller announced that the company has received substantial increased shipping schedules from all its dealers and distributors.

WILFORD MANAGES CENTRAL FORGE

J. W. Wilford, who has been connected with Lansing industries for the last 14 years, has been called to Detroit by the General Motors Corporation to become general manager of the Central Forge Company. For the last two years he has been manager of the Michigan Crankshaft, Lansing and Saginaw units. Mr. Wilford was first associated with the old Omega Separator Company and later with the Reliance Engineering Company. He then became manager of the Michigan Crankshaft Company. T. M. Carpenter, his assistant at the Saginaw plant, will succeed him as manager of the Lansing factory.

FRANKLIN ON 100 PER CENT BASIS

The H. H. Franklin Manufacturing Company, maker of the Franklin cars, went 1:to 100 per cent production on February 10 and is now turning out 40 cars a day. Production since the price reduction in September has been 80 per cent of normal; before that it was 40 per cent.

JACKSON DEALERS ORGANIZING

Initial steps for an organization of the automobile dealers of Jackson have been taken.

$500,000 ORDER FOR COMMERCE

George D. Wilcox, director of sales and advertising of the Commerce Motor Car Company, Detroit, announces the enlargement of the territorial operations of the Mead-Commerce Truck Company, Chicago Commerce distributors. A new contract has been signed which involves the purchase of nearly $500,000 worth of trucks, which, as fast as the factory can deliver, will be placed in the new territory among the dealer organization of the Mead-Commerce company.

FISHER FINDS BETTER OUTLOOK

F. J. Fisher, secretary and treasurer of the Standard Motor Truck Company, Detroit, has returned from a southern and eastern trip and reports that the business situation everywhere is improving. He says trade leaders with whom he talked are unanimous in the belief that the depression is about over.

CURRAN MOTOR PRODUCTS FORMED

The Curran Motor Products Company, with sales offices at 2018 Park boulevard, Detroit, is a Michigan corporation capitalized at $700,000 just organized to market automobile accessories, but especially the inventions of Dr. Edward Thomas Curran, of Detroit. The inventions include a spark plug, a priming cup device, an anto thermometer and other automobile parts. The officers are: President, Dr. Edward T. Curran; vice-president, M. N. Nahikian; secretary-treasurer, P. D. Mackey; retail sales manager, P. T. Quinn. Manufacturing, assembling and distributing headquarters will be in Detroit and distributive branches will be established in New York, Chicago, Minneapolis and Los Angeles.

WEISMAN WILL SELL H. C. S. CARS

The Weisman Motor Sales Company, 3629 Woodward avenue, Detroit, has taken over the local agency for the H. C. S., a four-cylinder car designed by Harry C. Stutz. Mr. Stutz started in the industry as a builder of transmissions and axles, then organized a company to build motor fire apparatus. Later he designed the Marion models of 1910 and 1911, and two years ago organized the Ideal Motor Car Company to build the Stutz car.

NEW HUDSON AGENCY IN LANSING

The Robson-Graves Auto Company has been incorporated with a capitalization of $30,000 and has leased the new Whitlock building, Lansing, for salesrooms. The company will handle Hudson cars. Officers are: Dwight J. Robinson, president; Joseph H. Burton, vice-president; Clark Graves, secretary-treasurer.

ATLAS DROP FORGE BUSY

The Atlas Drop Forge Company, Lansing, is now operating at two-thirds capacity with considerable motor work in sight, much of this being for the Reo Motor Car Company. The Federal Drop Forge Company also has considerable motor work on hand.

MULCH SUCCEEDS R. C. DURANT

The General Motors Corporation announces that R. H. Mulch, who has been with Chevrolet five years and who has been working out of the New York sales office, under W. C. Sills, is to become head of the Chevrolet Motor Company of California March 1 when R. C. Durant retires to join his father, W. C. Durant in Durant Motors. The Chevrolet manufacturing organization on the Pacific coast will continue to be headed by Norman Vaux.

DOUGLAS WITH JOHNSON COMPANY

The William R. Johnson Manufacturing Company, Chicago, maker of windshields and glass equipment for motor cars, has appointed Stephen A. Douglas general sales manager.

Digitized by Google

SHERIDAN CAR IN DETROIT

The latest product of the General Motors Corporation, the Sheridan automobile, manufactured by the Sheridan Motor Car Company, Muncie, Ind., is attracting unusual attention with its introduction into Detroit by the Detroit Sheridan Company, 4208 Woodward avenue, at Willis avenue. The Sheridan is presented in two distinct types, one powered by a valve-in-head, long-stroke, four-cylinder motor, and the other powered by a high-speed, eight-cylinder motor, the specifications of which place it in the highest class of finely built motor cars. The four-cylinder car is offered in four models, roadster, touring, coupe and sedan, built on a chassis which has a wheelbase of 116 inches. The eight, with a wheelbase of 132 inches, is offered in three models, a seven-passenger touring, a coupe and a sedan.

STUDEBAKER JANUARY SALES

A statement issued by the Studebaker Corporation, Detroit and South Bend, Ind., says that January sales for immediate and spring delivery exceeded those of the same month of 1920. Reports from dealers are encouraging. The plants are operating on a 50 per cent schedule.

PIERCE-ARROW BALANCE SHEET

The balance sheet of the Pierce-Arrow Motor Car Company, Buffalo, as of December 31, 1920, shows total assets of $27,356,097. Net tangible assets of $9,872,959 are equal to $49.49 a share on the 250,000 shares of common stock. Current assets were $19,754,534, and current liabilities $7,333,138, showing net working capital of $12,421,396. Bank loans amount to $5,750,000.

KELSEY MOTORS ELECTS

The following officers and directors were elected at the annual meeting of the Kelsey Motor Company, Newark, N. J.; President, Ernest B. Slade; vice-president, C. W. Kelsey; treasurer, Thomas J. Stewart; secretary and assistant treasurer, F. D. Dorman. The board of directors consists of Charles Abbott, E. I. R. Cadmus, E. J. Churchill, Charles W. Hoyt, A. E. Jennings, John R. Thomas and L. S. Tyler.

NEUMANN SHOW NEXT WEEK

William F. V. Neumann & Sons, Detroit Pierce-Arrow dealers, will hold a motor car show of their own, all next week, at their show rooms at 6022 Woodward avenue. The new line of Pierce-Arrow motor cars, in both open and closed models, and which have the left-hand drive, will be featured. The unusual interest which these recently announced models has aroused undoubtedly means a large attendance at this showing.

H. E. DODGE WILL PROBATED

Judge Edward Command, of the Wayne probate court, has admitted to probate the will of Horace E. Dodge, late Detroit motor vehicle manufacturer. Bond of $100 was fixed for the administrators, Mrs. Anna Thomas Dodge, the widow, and Howard B. Bloomer, chairman of the board of directors of Dodge Brothers.

The hearing of the case of John Duval Dodge, who is contesting the will of his father, John F. Dodge, has been postponed until March 10. It is reported that efforts are being made to obtain a settlement out of court.

ZENITH FOUNDRY READY MARCH 1

It is expected that the new $200,000 plant of the Zenith Foundry Company, Detroit, will be in operation by March 1. The company will manufacture light gray iron castings. Stanley Leech is president of the company and Alexander M. Girardin, secretary and treasurer. The superintendent of the foundry is Robert R. Snow.

HOOD LEAVES MAXWELL-CHALMERS

Roy M. Hood, who has been in charge of purchases at the Maxwell-Chalmers Corporation plant, Detroit, has resigned.

TRANSPORTATION NEWS

Rail :: Commercial Hauling :: Water

Washington—The House of Representatives has passed the bill of Rep. Frank D. Scott, Michigan, extending the legal summer shipping season on the Great Lakes 15 days in spring and fall and thereby making the season during which summer regulations regarding safety appliances are in force begin May 1 and end October 15.

Edward Dustin, president of the Ashley & Dustin steamer lines, characterizes the House's action as "a poor compromise which does not offer the relief needed lines to operate at a profit." He added that it would in no way influence the recent decision of his company and that of the D. & C. to curtail service.

Detroit—Traffic on the Pere Marquette Railway, according to the Transportation department's figures for the month of January and the first week of February, has not been showing up as well as was expected. Moreover, it has been decidedly out of balance. The freight movements have all been eastbound with practically no movement westbound. This makes for costly operation, since there is unusually heavy return haul of empty freight cars. The movement of freight cars homeward bound is continuous. For the first week in February 1,500 cars had returned to the home lines, which is from 60 to 65 per cent of the company's cars. This is the highest percentage attained in a long period. During the period of federal control the percentage fell below 20 per cent. With the recession in traffic many of the railroads which had been holding this rolling stock have been returning the cars to the home lines in order to avoid the payment of the per diem charge of $1 per car per day.

Washington—In the case of the Acme Cement Plaster Company, Grand Rapids, Mich., vs. the director general of railroads, as agent, the Pere Marquette Railway, et al., the Interstate Commerce Commission has decided that the rate applicable on gypsum hollow building blocks, in carloads, from Grand Rapids, Mich., to Asyinm, Tenn., are not unreasonable and has dismissed the complaint. The case, which was No. 11080 on the Commission's docket, was submitted on June 4, 1920, and decided on December 29.

Finish Fight Promised On Higher Truck Tax

Monroe county's effort to exact tribute from the motor trucking industry through Rep. George Danz's bill increasing the license fee for trucks from 35 cents to $1 a hundredweight, which has been introduced in the Michigan Legislature, has aroused a storm of protest and the Detroit Transportation Association, representing the trucking industry in Detroit and environs, has begun a campaign to defeat the measure. The Detroit Board of Commerce has been asked to register its disapproval of the bill, and the legislative committee on roads has been asked to call a public hearing on it.

While the 25 cent fee per horsepower is left as it is, the increase from 35 cents to $1 on the weight of commercial cars would mean an advance of 150 per cent, according to the transportation association.

Back of the measure is the contention of Monroe county officials that truck and trailer traffic on the Dixie Highway between Monroe and Toledo, has broken down that road. The Association replies to this charge with the assertion that the Wayne county section of the Dixie Highway was constructed years before the Monroe county section was started, despite which, the Wayne county section is in much better condition than that in Monroe. Further, it is contended that the highway through Monroe was not constructed for heavy traffic in the first place, and the moist subsoil presents an obstacle to substantial road building.

The bill is regarded as a direct and serious blow to the future of the motor trucking business. It is regarded as unfair because while directed at long hauls, it also affects short hauls within city limits. Increased license fees would have to be passed on to the public in increased haulage rates. It is estimated that not more than 10 per cent of Michigan-owned trucks used the highways in long hauls.

ARCHITECTS ELECT OFFICERS

The Michigan Society of Architects has elected Alvin E. Harley, Detroit, president. The other officers are: C. F. J. Barnes, Detroit, first vice-president; J. F. Beckbissenger, Saginaw, second vice-president; H. L. Mead, Grand Rapids, third vice-president; William C. Palmer, Detroit, secretary; H. J. Keough, Detroit, treasurer; W. G. Malcomson, E. A. Schilling, R. H. Marr, J. H. S. Steffens, George J. Haas and Harry S. Angell, Detroit; A. E. Munger, Bay City, and C. F. Cowles, Saginaw, directors.

LANSING HAS CONVENTION HALL

The Lansing Chamber of Commerce has arranged for an annex hall in the new Strand Theater building. This hall, which is 165 by 52 feet, will be provided with a stage and other accommodations, and will have a capacity for 1,200. The hall will be used as headquarters and meeting place for conventions.

700 NEW BOARD MEMBERS

Last week's membership campaign of the Detroit Board of Commerce resulted in the addition of 700 names to the roster, each new member having signed for three years. The Board thus is assured of an income of $17,500 a year for that time and in consequence will have a paid secretary. A complete reorganization will be effected within the next month.

LOADING COPPER FOR GERMANY

The Michigan Smelting & Refining Company, which smelts mineral from the Copper Range mines, Champion, Tri-mountain and Baltic, has started loading 560,000 pounds of copper for Germany. This is the first copper sold by this smelter to Germany for a year and a half and is considered a hopeful augury for an increased foreign demand for the metal.

BUSHNELL AGENCY CHANGE

The advertising and sales promotion service agency conducted by Henry D. Bushnell will hereafter be operated under the firm name of Bushnell-Mac Queen-Bushnell, the members of the organization being Henry D. Bushnell, Kenneth H. Mac Queen and James B. Bushnell. The same office location, 816-7-8 Kresge building, Detroit, will be retained.

BARIUM STEAMSHIP ELECTION

Stockholders of the Barium Steamship Company, Detroit, have re-elected directors as follows: John J. Barium, S. Lee, George B. Greening, Thomas J. Barium, Lewis T. Barium. The directors re-elected as officers: President, treasurer and general manager, John J. Barium; vice-president, A. R. Lee; secretary, George B. Greening.

INDUSTRIAL BUILDING

Progress, Projects and Contracts of the Week

Lansing—W. E. Wood Company, Detroit, has obtained the contract for the completion of the new state office building at a cost of $1,100,000, making the total cost of the building about $2,750,000. The work will be held up pending an appropriation by the Legislature.

Lansing—The Lansing Forty Associates Company has purchased from the Odd Fellows the property at the corner of Capitol and Kalamazoo streets at a cost of $20,000. The old Free Baptist church will be torn down and replaced by a business block with four stores and flats above. The H. G. Christman Company is preparing estimates.

Detroit—The Semet Solvay Company has awarded to the Whitehead & Kales Iron Works the general contract for the erection of a steel sitting plant and boiler house of brick construction.

Lansing—Judging from the building statistics from 56 other cities in the country, Lansing continues up in the lead in building activities. During the first month of 1921 the city showed a gain of 71 per cent over the same month last year, being second to Kalamazoo with 97 per cent. The total valuation of new building work in Lansing, however, was $49,635 as compared with $38,800 for Kalamazoo.

Rosenheim Visits His Banker

(*Continued from Page 8*)

sane and conservative volume of business which will in the end prove more satisfactory than an abnormal boom which is allus followed by the inevitable reakshun. I spose you are in this mornin' to increase your deposit. And, say, Mr. Rosenheim, it's a fine boy you have in little Abie. I take an interest in him seein' we have the same given name. Why don't you start him off this year with a Christmas savings account to be cashed in next December?"

"See, Meyer, in this line it is very thinkin' how to get your money in his bank that he doesn't reelize that a Jewish Christmas account would be like the Anti-Saloon League savin' up for a champagne banquet.

"'No, Mr. Fishcorn,' I tell him, 'what I come in this mornin', was to see about negotiatin' a loan.'

"Right away, Meyer, his face fell like he has heard bad news, and he says, 'I see, I see. Perhaps we can arrange it. But you know, Mr. Rosenheim, the outlook for business in the near future ain't what you call bright. Europe is makin' enormous demands on our resources and there is great uncertainty as to what the new administration will do regardin' the excess profit taxes, the income tax and the soldiers' bonus. Then we are worried considerable over the attetude of Japan in regard to the California alien land law, and the Irish question is causin' grave concern in finanshul circles.' Then there is Rooshy,' he goes on sorrowful like. 'Rooshy is in a state of chaos and we ain't certain just what Lennon is a going to do. And then there is China. The famine in China is sure to call for an immense expenditure of money. And the Flume Inlent ain't settled by any means just because D'Annunzio surrendered. Then you know, France needs money, Holland needs money, Sweden needs money—'

"'Never mind, Mr. Fishcorn,' I interrupts, 'we'll just admit that they all need money and let it go at that. Also we will admit that the kangaroo market in Australia is jumpy, and the earthquake district in South America is shaky, and that snails are a little slow in France, and that Ice in Greenland is low on account of overproduction. Let's get back to America and see if Max Rosenheim can borry a little money on good security, understand.'

"When I pin him down to it, Meyer, he invites me into his private office, takes a clear out of a box and then locks the box in his private safe; and then he frowns and asks me how much I want. I tell him, and he bites a pencil a few minutes and then rings for a clerk and asks for a statement of my account and a report on the clothing industry. Next he unfolds one of them funny maps what Mr. Habson sends round and studies the colors on it, until I gets so nervous that I can't keep still and I sez, 'Mr. Fishcorn, mebbe you better get Washington on the long distance and see what President Wilson thinks about this here matter, and if he's too busy packin' up, y' understand you might switch over to the Treasury Department and get Mr. Houston's ideas on the subjeck, because I'm a peace lovin' man and if my borryin' money of you is a goin' to affect the rate of exchange between here and Zanzibar or Abyssinia, why, it's all off, understand, and I'll see what I can do with Rachel's fur coat and diamonds over in Mose Morgenbaum's pawn shop.'

"And do you know, Meyer, that gonef didn't get the sarcasm at all. He just writes down, 'Wife has fur coat and diamonds' on a memrandum pad and puts it in the file. When he finally puts his O. K. on the loan I gets me out quick for fear he'll try to make me deposit it in a savings account where I'll draw four per cent on it while I'm payin' him six."

"Well, you got the money, didn't you?"

"Sure I got the money, and I knew I'd get it all the time because it was secured, and I been a depositor there for twenty years. Old Fishcorn knew I'd get it the minute I told him what I wanted.

"A bank must be conservative, Max. They must pick their customers carefully."

"They do, Meyer. They pick them carefully—and thoroughly."

PENINSULAR PAPER STATEMENT

The Peninsular Paper Company, Ypsilanti, exhibits a growth in total assets of $200,000 during the year 1920 and a growth in surplus account of $108,000. Below is presented a comparative statement of assets and liabilities:

Assets	Dec. 31, 1920	Dec. 31, 1919
Cash	$ 415.06	$ 1,661.40
Liberty bonds	.....	26,550.00
Store	5,926.07	6,470.46
Inventory	253,787.90	170,994.02
Customers' accounts	133,373.61	94,257.04
Water supply pd. in adv.	166.64	.....
Plant	443,033.95	335,774.63
	$836,113.43	$635,707.55
Liabilities		
Accounts payable	$131,474.41	$ 96,787.41
Notes payable	19,150.00	27,000.00
Bond account	300,000.00	110,000.00
Hydro income pd. in adv.	4,000.00	4,000.00
Capital stock	200,000.00	150,000.00
Surplus	131,464.97	238,647.97
Reserve for depreciation	149,228.38	76,754.39
Detroit Edison Co.	.....	2,642.78
	$836,113.43	$635,707.55

Officers for 1921 are: President, Daniel L. Quirk, Jr.; vice-president, Junius E. Beal; secretary and treasurer, Edward C. Cornwell; superintendent, John P. Cooney; sales manager, John B. Shepherd. Directors for 1921 are the above and A. C. Shaw, and Alfred A. Srere, Franklin, Ohio.

Yoeman Gives Indications Of the Industry's Comeback

An opinion as to the situation in the automotive industry, now that the two national shows are over has been given by G. W. Yeoman, vice-president and treasurer of the Continental Motors Corporation, Detroit, upon request of S. S. Meyers, general counsel of the Motor Accessory Manufacturers Association. Mr. Yeoman's letter follows:

"In reply to your letter of February 1, asking whether or not there were any signs of a revival in the automobile and truck field, I can only say you should have been at the Chicago show. All manufacturers have turned from pessimists to optimists. They are not only securing new agencies, but the agents are actually selling a large number of cars.

"This condition is further evidenced by the fact that we have been compelled to put on nearly 1,000 men in our Detroit plant, where we build automobile motors, to meet this month's demand. It is safe to say that our orders for delivery in the month of March will be from 30 to 40 per cent greater than the February demand.

"If any one tells you this is only a little spurt and that the demand will decrease, tell them that they are crazy. It is the writer's belief that the present demand for automobiles will steadily increase each month to June 1. Statistics of this industry will show that each year the sales slow up to a certain extent about June 1. This is caused by manufacturers' introducing new models at that time of the year. Next June may be an exception to the rule, but if there is any slowing-up it will only last for a short period.

"There has been too much written by people who are not posted, as to the world's demand for cars being near the saturation point, but as you well know, if the automobile manufacturers are called upon to build in 1921 only the cars for replacement, it will give them a good business.

"The business of the Continental Motors Corporation is a good barometer upon which to base your judgment. At the present time the gasoline engine stocks at the car manufacturers' plants are very low, and we are no doubt receiving the first indications of the automobile industry's comeback.

"Sixty to ninety days from now, the automobile business, through the possibilities of liquidation of large stocks of inventory, should be in a very advantageous position again to establish itself on a cash basis.

"The sale of trucks has not yet started in any volume, although we have orders in hand from about 60 per cent of our customers for shipments the latter part of February and the months of March and April. As you probably know, all motor equipment used by industrial firms has been greatly reduced, and therefore the minute other lines of business improve there will be a steady demand for truck transportation.

"Our entire organization is of a firm belief that the automobile and truck industry is built on a strong foundation and that the products are as necessary to the upbuilding of this country as the raising of foodstuffs and other so-called staple articles.

"The automobile especially is again on the way to several years of prosperity."

The letter was written on February 5.

MICHIGAN MANUFACTURER AND FINANCIAL RECORD

EDITORIAL

DETROIT, SATURDAY FEBRUARY 19, 1921

Mr. Ford, the Big Cities and the Little Ones

OUR good friend, Mr. Henry Ford, is a sly one when it comes to getting publicity from newspapers without consulting the hellions who collect so much per inch or line for the advertising which goes through the business offices. Once in every so often the genial sage of Dearborn eliminates from his inner consciousness some quip, or crank or wanton wile, conveying some new, surprising or shocking idea to the world, whereupon the newspaper press eats it up because it is Henry's, and devotes columns of space to it, lest the world forget that Mr. Ford is the manufacturer of a staple article of transportation. If Mr. Ford himself has as much humor as we suspect he has—he being of the jocose Irish race—he sits idly by and chuckles, grins, snorts and gives other evidence of the fun he has in putting it over the advertising departments by getting into the news columns, top of the column next to reading matter, without the symbol "Adv." attached to his pronouncements and at absolutely no cost. As most of the declarations are harmless subjects, like, for instance, the synthetic cow and the gas-driven street car, no harm comes from the exploitations to the general public and a good deal of positive good does come to the flivver and the tractor.

Occasionally the sage of Dearborn slips his trolley and does put out harmful and inexact doctrine which only leads to more free advertising, but does in the last analysis lend the influence of a potent name to the dissemination of the particular economic or social heresy which is, for the time being, made the vehicle of new publicity. The other day Mr. Ford, in discussing the prospects of resumption of large scale manufacturing, declared that hereafter he would do a deal of his own work in establishments located in small places. He inveighed against the large city as a proper location for industry and generally denounced such aggregations of population as furnishing bad conditions for workers and employers engaged in production. America is so thoroughly divided into two great camps of interest, the agrarian and the urban camps, that Mr. Ford's doctrine is quite apt to fall upon inviting ground and feed up the bad sentiment which some disorderly-minded Americans entertain respecting industrial centers and the aggregations of capital which are at once their cause and their result.

The Southern editorial writers never discuss a political question without beginning at the real beginning, which for them is usually Patrick Henry or Thomas Jefferson. By the same process it may not be uninteresting to begin at the beginning of cities, notice how they came about, and how intimately their growth has been affected by the changes of method in transportation and distribution. In Britain, as the Roman armies advanced in the days of the conquest, they rested after each full day's march and made their camps, or castra, which reappeared as the "Chesters" in town names, such as Manchester, Portchester and the like. The rule of the transportation movement of those days, which was on the hoof, was a day's travel, of twenty to thirty miles. That distribution of camps, of the settlements that followed them and of the business that grew up in these settlements determined the distance from town to town just as long as transportation on the hoof continued. It marked the settlement of our own country, the multitude of night-camps or villages being so great that, of necessity, there could be no great average assemblance of population.

When transportation facilities became improved by the introduction of steam as a motive power and the railroad track as a corrective of grades and road conditions the average day's journey lengthened and we find that there grew up under this influence larger communities, each marking the end of a day's journey by the improved methods of transportation. Thus there came into being, taking New York as an example, cities like Albany, Rochester and Syracuse, and Buffalo, the trip from one to the next being an average day's journey under the primitive railroad conditions. As speed increased the length of the day's journey there came up still greater cities, fewer in number, each in its turn the end of one period of day-light travel. Thus the country is marked today, westwardly from New York, by Buffalo, Cleveland, Detroit, Chicago, Omaha, Denver, Salt Lake City, and so on, each city being, as to its nearest neighbor from eight to twelve hours of travelling distance.

The communities that thus grew up became the natural centers of production and distribution; of production because their fewness enabled them to attract much population, and of distribution, because the transportation factors that made them pre-eminent over their rivals were available in the greatest degree to assist in the processes of distribution.

Production and distribution have made the great cities and the suggestion that these processes be carried on in localities less developed is a reversal of the logic, which led to their creation, a logic which is not the creature of the brains of men, but of the inexorable processes of economic evolution.

The great city, so far from being a detriment to industry or to those engaged in it, is the natural habitat of production and producers. Based as it is upon facilities for distribution, which must be adequate both as to inbound and outbound materials, the great city affords facilities in the way of transportation which are only necessary at intervals across country, for the substitution of motive power, the rearrangement of carloads and the other incidents of transportation, and which make possible the correlative movements, such as bulk delivery, switching and classification of moving raw materials and merchandise into train units destined for another comparatively long run. These things are not needed to be done at every cross-roads, and consequently the transportation fabric of the country cannot provide the structures and organizations usually described as terminals in other than the places which are best fitted for them and which with much singularity and nicety, occur just as the Roman camps of 2,000 years ago occurred, at the end of the day's journey. For, after all, man is the dominant factor, the limit of his day's work the limit of mechanical effort on one shift, and the necessity of a place for him to lie down and rest when his day's work is done, the equal necessity for his placement of his home and of his facilities for rest.

The big city is essential to industry, because it constitutes the clearing house for labor. Production is no longer the steady and continuous demand for workers that it once was. In the olden time a body of workers, neither greater nor smaller as the years went by, constituted the personnel of the ordinary manufacturing industry. One may read that from the history of the earlier stove factories of Detroit. In each of them approximately 1,200 men were employed for ten months in the year. There were neither more nor less, neither more months nor fewer. Fathers worked and grew old, sons grew up, were apprenticed and took their father's places on the moulding floors and at the benches. That was because they were producing a staple, with a steadily increasing market, and the increases were so located that new stove factories came into existence in the newly developed areas. Today production is a creature of market conditions. When Mr. Ford's factory was running full, or anybody else's employing great numbers of men, for that matter, the figures of demand coming in through the morning's mail, determined

Digitized by Google

whether a thousand men should be put to work on the morrow or five thousand men laid off. Did not the big city provide a supply of workers when the thousand more were needed, or a supply of work when the five thousand were laid off, all the result of the operation of the law of averages, such responsiveness of production to market conditions would be impossible. If, for instance, five thousand men were laid off in some minor cities of Michigan in a single day, it would mean ruin to the communities. Were Mr. Ford's full force laid off, as it has been in Detroit, in some city of England, France or Germany, it would mean revolution.

The big cities serve as the clearing-houses for big industry in our country. The little ones have their own places in the economy of production, but being out of the problem so far as great movements for distribution are concerned, it is neither good industrial doctrine nor good popular instruction to hold them up as being superior locations for production in split-up units. The great city has its defects and its problems, which it is rapidly solving, but which are immediately supplemented by other and newer problems; but one of these defects is not a lack of adaptability for production. It was the problems of production and distribution that made the big city. It is the same problems that will force its growth and dominance.

Mr. Ford would have been a much clearer-headed man had he given some of his life-time to the study of economics; but, if he had done so, he might not have been so great an industrial leader, so that, after all, maybe things are all right as they are.

Buy Intelligently, But BUY

BUSINESS is on the mend. Factories are reopening—with curtailed forces or on reduced time schedules, but reopening nevertheless. Michigan, especially, finds encouragement in the fact that motor vehicles, one of her chief products, are beginning to sell—in smaller quantities in most instances, no doubt, but selling nevertheless. That means that the manufacturers further on down the line—the men engaged in making the materials and parts that go into automobiles and trucks—are beginning to find a market for their output.

The process of recovery will be slow. No one need expect a revival overnight. But those who think deliberately would wish a "spurt." "Spurts" by the very nature of things mundane are followed by reactions; and we do not wish a reaction. We wish to consolidate our gains as we make them, as the military men say. We do not wish to be obliged to give ground, once we have won it. The crisis is past; a panic has been avoided; now for the long pull ahead!

Business can help measurably in the process if it will follow the policy of buying moderately—not for a long time ahead, but to care adequately for current needs and for the needs that will grow just a little larger as the weeks go by. A policy of not buying at all not only contributes nothing to progress on the upgrade, but is sure, sooner or later, to bring about the inevitable reaction of prices upward. As an advertiser in these columns asks, "Would it not be better for all of us to do a moderate amount of buying and not allow the inexorable law of supply and demand to play havoc with us once again? Why not strive to keep the wheels of industry turning at least in some measure, that we may maintain a continuous market, rather than foster those eternally devastating fluctuations?"

If the wheels of industry are kept turning, they will gain momentum; it will be much easier to gain that momentum than if they are allowed to come to a standstill. An object in motion tends to remain in motion; an object at rest tends to remain at rest. Without buying, there can be no business. So buy moderately. Buy moderately not only to keep business moving, but to show the fellow whose courage may not be at any lower ebb than yours, but who can't conceal the fact quite as well as you can, that you have confidence in the future—that you have not been taken off your feet. The news that you are in the doldrums will spread quickly enough, you may be sure; and as the circle becomes wider, it won't be long before we all are in a cheerful frame of mind. The rest will be easy.

Buy intelligently, but BUY.

Short Measure Stuff

FORD'S SYNTHETIC COW STARTS SOMETHING

HENRY FORD certainly started something else when, in an interview a few days ago, he predicted the end of the old-fashioned cow and put in her place a synthetic substitute containing the nutriment of milk. We presume it will be a sort of lady bull-ion cube.

The dairy and packing interests are all het up about it. A Bovine Defense League will soon be announced, with offices in Washington and a full time secretary.

As we go to press we are in receipt of a letter from Mr. Jiggs and his good wife, Maggie, begging us to use our influence toward having Mr. Ford abandon the idea.

"What would we do for corned beef?" they wail. "It is to cabbage what ham is to eggs."

Another touching appeal comes from Jess Willard.

"I am soon to meet Jack Dempsey again," he writes. "I wonder if Mr. Ford will be able to provide a synthetic beefsteak that I can put on my eyes after the fight to reduce the swelling and take out the black. Tell him for me to have a heart."

King Alfonso cables to know if there will also be synthetic bulls available for "toreadoric" purposes.

And last night in the still small hours, our Ouija board got excited. We were paged from the otherwhere by the author of a famous jungle, who does not care to be relegated to oblivion by this bit of progress; therefore asked to make the following revision on his best known work:

"Where are you going, my pretty maid?"
"After synthetic milk," she said.
"May I steady the pail, my pretty maid?"
"We milk with a basket now," she said.

THE FIRST ROBIN

This column hereby announces the First Robin Sweepstakes. Open to anybody in Michigan. Who will be the first one to spot the first robin? Send in your entry as soon as you spot him. We will award a handsome plate glass toothbrush to the first one who spies the dear little birdies. Other prizes to be announced later.

All accounts must be accompanied by affidavits and the signatures of at least two character witnesses.

Now then, all together.

FINANCIAL

THE BUSINESS OUTLOOK

By PHIL S. HANNA

IF there is any one individual in the United States in position to observe all the trends of our complex business and financial changes, it is Governor Harding, of the Federal Reserve Board. He stated to Congress February 16 in the Board's annual report that business was on the upgrade, and in his remarks we may find much of comfort as regards the course of business in 1921.

But by going further into the report one finds a qualification which must not be overlooked, and that is the reference to business conditions in the remainder of the world and to what extent the curing of these troubles depends on the United States. The essence of the problem as pointed out by Mr. Harding is that unless we can continue to finance the shipment of raw materials to Europe so Europe may continue in the manufacture of goods which we import, we may find our foreign trade vanishing almost down to exchange of necessities. This danger often has been emphasized in the last six months and it is of utmost importance that American business get squarely behind agencies such as the Foreign Trade Financing Corporation, not only morally, but by taking stock in liberal amounts. The benefits to come from the success of this financing corporation are of such import that nothing short of a campaign similar to the Liberty Loan drives should be put on to get the stock sold, and sold quickly. Forty million dollars went into the copper syndicate loan in a twinking and the capital of the new bank has $100,000,000, which should come readily when the benefits are fully comprehended.

Getting back to Detroit and Michigan, the trend seems to continue slowly upward. Unemployed are somewhat more in evidence on the streets the last week, but it is not clear whether this is due to the fine spring weather or more unemployment. Reports from industrial plants are that about 3,500 more men are at work this week than last. Wholesale houses report increasing orders from up-state customers, but as spring draws near the conviction grows that it will be fall before any abrupt and sustained buying takes place.

CARO BANK IN NEW BUILDING

The State Savings Bank, Caro, will hold a formal opening ceremony on Washington's birthday, February 22, in its new bank building, and regular business will be transacted in the new quarters beginning Wednesday, February 23. This paper has not been furnished with the data concerning the new building, but from the picture which J. McNair Ealy sent, it would appear that the building is going to be unusually attractive. J. McNair Ealy is president; Grant H. Slocum, vice-president; Louis Wean, cashier, and C. R. Myers, assistant cashier. The board of directors is comprised of the officers mentioned, together with several old associates of the Ealys, including the following: Peter C. Pardee, C. W. Stacy, D. J. Evans, John W. Quinn, Walter S. Wixson, William P. Campbell, Henry P. Bush, Amos L. Kinney, Lee R. Stewart and Frank B. Campbell.

Michigan State Banks Still In Billion Class

Total resources of the 547 state banks, two industrial banks and 11 trust companies chartered under the Michigan law, at the close of business December 28, 1920, were $1,043,305,087. On June 30, 1920, resources of 544 state banks, all classes, totaled $1,064,774,752. Total deposits December 28, 1920, were $839,469,463, as compared with $885,009,280 on June 30, 1920. New banks opened since September 8 report of the commissioner were as follows:

Mattawan State, Mattawan	$ 20,000
Wayne County & Home, Highland Park	100,000
J. W. Free State, Paw Paw	30,000
First State, Maple Rapids	20,000
Center Line State Savings, Center Line	60,000
Baroda State, Baroda	20,000
Atlanta State, Atlanta	20,000
Peoples State, Stanton	20,000
Trout Creek State, Trout Creek	20,000
Bank of Cement City, Cement City	25,000
Continental, Detroit	700,000
Dime Savings, Hamtramck	100,000
Farmers' State Savings, Milford	50,000
Perrinton State, Perrinton	20,000

FEDERAL TRUCK STATEMENT

ASSETS

	(Cents omitted) Dec. 31, 1920	Dec. 31, 1919
Cash	$ 163,292	$ 177,884
Notes receivable and acceptances	83,040	.....
Accounts receivable	160,770	895,130
Securities	192,595	266,155
Plant accounts	1,382,248	811,293
Merchandise inventories	2,497,398	2,302,412
Prepaid expense	60,083	.....
	$4,525,340	$4,452,976

LIABILITIES

Notes and accounts payable	$ 352,734	$ 448,781
Dealers deposits	31,843	40,595
Land contract	233,360	75,000
U. S. government claim	359,091	458,888
Reserves for depreciation, etc.	577,649	476,003
Accrued expense	61,847	72,845
Capital stock	2,000,000	1,000,000
Surplus	806,812	1,883,863
	$4,525,340	$4,452,976
Total sales	10,629,742	10,526,265
Profit for year	746,878	1,281,706
Federal taxes estimated	206,000	420,000

Except for an increase in plant account of $572,000, against which may be offset the land contract liability increase of $260,000, thereby cutting down the net plant increase to $302,000, this is one of the few statements of motor manufacturers which has not shown an abnormal gain in plant and inventory account at the expense of liquid assets. It is also noteworthy in that the current payables show a decrease of $93,000 rather than an increase. Surplus and capital combined stand practically as a year ago, the only difference being that the large surplus of a year ago is now represented by stock. A net gain, estimated, of $545,000 (against $860,000 for 1919) should be acceptable to stockholders in view of business conditions the last four months of 1920, and the fact that current assets December 31, 1920, were only about $560,000 less than at December 31, 1919.

COST ACCOUNTANTS MEET

The Detroit chapter of the National Association of Cost Accountants has now become a full-fledged chapter, as its charter was received from national headquarters this week.

The next meeting will be held in the Board of Commerce building, Thursday, February 24, at 8 p. m., when the election of permanent officers will take place. A paper on an interesting phase of cost accounting will be presented by William F. G. Ross, of Marwick, Mitchell & Company.

All who may be interested in the work of the Association are invited to be present. There will be no charge for admission.

Protect Her Now

Your wife is your partner. Together you plan for the well-being of the family.

She cannot, however, become familiar with many of the details of property and business management. She is busy with other family matters.

But life is uncertain. Some day—any day she may be suddenly thrown upon her own resources. Where then will she turn for help? As her life partner you should know the answer to this question now.

The answer is simple. A Living Trust, established for you, and naming a competent, never failing trustee is a reasonable solution. A Living Trust may include all or part of your property. It may provide for other members of your family also.

By it your wife and family will receive without trouble the income from the Trust you establish. They will know too that their property is in safe, skilled hands. A Living Trust may be so made that you will receive the income during your life, if you wish.

We have published a book entitled "Living Trusts" which gives interesting facts and stories. As a business man you will appreciate it. Let us send a copy to you without obligation.

MANAGED BY MEN YOU KNOW

Where Able Business Men Fail

Men recognized as capable managers and executives often fail in an important duty to their families by neglecting to make wills.

At death the law steps in, their property is parceled out by statute, heirs inexperienced with finances receive lump inheritances, and quarrels, waste and unhappiness often result.

Attend to this duty now. Our booklet, "Descent and Distribution of Property," makes valuable suggestions. Send for free copy.

Banks and Bankers

NEW BANK AT CEDAR SPRINGS

The Farmers and Merchants State Bank has been incorporated at Cedar Springs to do a commercial and savings business. The capital is $25,000 and the principal incorporators Melvin E. Sanford and George Arnold, Cedar Springs, and James E. Hanna, Solon township, Kent county.

CONTINENTAL'S DEPOSITS

The new Continental Bank, Detroit, reports deposits in excess of $1,250,000 at the close of the first two weeks' business. This augurs well both for the bank and for the general condition of business.

MANISTIQUE ELECTIONS

The following bank elections are reported from Manistique:

First National—Officers: William B. Thomas, president; V. I. Hixon, vice-president; W. C. Crowe, cashier; Paul Baldwin, assistant cashier. Directors: Wm. B. Thomas, V. I. Hixon, W. S. Crowe, L. Rosenthal, John Falk.

Manistique Bank—Officers: Chas. D. Orr, president; O. G. Quick, vice-president; E. H. Jewell, cashier; C. E. Kaye, assistant cashier. Directors: C. R. Orr, O. G. Quick, E. H. Jewell, R. B. Waddell, E. W. Miller.

State Savings—Officers: Leo C. Harmon, president; Benjamin Gero, vice-president; Wm. J. Shinar, cashier. Directors: L. C. Harmon, Benjamin Gero, W. J. Shinar, G. S. Johnson, E. R. Westcott, August Carlson.

EMPLOYES PUT ON A CONTEST

Employes of the Capital National Bank, Lansing, staged a contest for new business from November 15 to January 15 that was interesting and a business greeter for the bank. Two teams were chosen and "pep" meetings held every few days. Each team reported its progress at the end of 30 days and then the final report came at the end of the contest. A schedule of points for the different classes of accounts was worked out and the winning team came out ahead by 3,000 points.

The bank paid the employes a stated amount for the accounts obtained and at the banquet furnished by the losing team, the place cards were unique in that they were cashier's checks for the amount earned by each employe in the contest. Special prizes were awarded by the bank for the largest number of accounts, largest single account, and highest average.

The result of the contest was gratifying, several hundred accounts being added.

E. D. FISHER'S PLANS

It is reported that Edmund D. Fisher, formerly deputy controller of the city of New York, and who resigned recently as vice-president of the Bank of Detroit, will announce soon an important connection with a large eastern bank.

George B. Judson who was recently elected to the board of directors, becomes senior vice-president, and C. H. Haberkorn, Jr., a director, has been elected vice-president in an advisory capacity.

CLEARING HOUSE ELECTION

Charles H. Bender has been elected president; L. Z. Cauklin, vice-president; T. William Hefferan, secretary, and A. H. Brandt, treasurer of the Grand Rapids Clearing House Association.

General Financial News

COURT FIXES PAR BASIS

Petition for rehearing in the case of the Detroit Mortgage Corporation, asking that the Secretary of State be mandamused to accept its offer of a franchise fee to do business in Michigan on a basis of $10 a share for non-par value common stock, has been denied by the Michigan Supreme Court. This means that hereafter all foreign corporations entering this state must pay a franchise fee to be computed on the basis of the value fixed for no par stock in the state where they are incorporated. The Detroit Mortgage Corporation is a Delaware

Digitized by Google

corporation with its non-par stock value placed at $100 as a basis for fixing the franchise fee, but offered to pay in this state on a $10 value. The decision of the appeal board went to the supreme court. The decision practically abolishes the appeal board, holding that it has no judicial power in such matters, its authority being limited to minor affairs. There are many foreign corporations now who have paid under protest or not in full, which will be required to pay in accordance with this decision or have their franchises suspended.

SHERWIN-WILLIAMS COMPANY

The Sherwin-Williams Company, Cleveland, which absorbed the Acme White Lead & Color Works, Detroit, last year, declared February 8 the regular quarterly dividend of 2½ per cent on the $25 par value common stock. This is payable February 15 to stockholders of record February 14 and is the 145th consecutive quarterly dividend paid on the common stock. The company has never passed a dividend and for the last 23 years the common dividend has not been below 10 per cent per year. G. A. Martin, vice-president, is quoted as follows:

"Our finances are in splendid shape. We have recently reduced the price of prepared paints $1 a gallon. We were the last to feel the depression and will be among the first to recover if present orders are any indication. Our plants are now operating on a 75 per cent basis. Reports indicate that dealers' stocks are low and as the spring demand comes to the trade, we expect a rush to take care of the business."

McCORD CREDITORS' MEETING

At the creditors' conference held Friday, February 11, at the Detroit Board of Commerce about 90 per cent of the bank and merchandise creditors of the McCord Manufacturing Company, Detroit, assented tentatively to an extension of from six to twelve months in maturity of their claims. Joseph T. Schlack, former vice-president of the McCord company, was retained as general manager and Lot M. Hamlin was continued as secretary and treasurer. It is reported that the entire property is to be placed in the hands of the creditors' executive committee, which is comprised of John Fletcher, vice-president of the Fort Dearborn National Bank, Chicago; Lewis H. Jones, president, Detroit Copper & Brass Rollings Mills, and Walter L. Dunham, vice-president of the Dime Savings Bank, Detroit.

WESTERN KNITTING MILLS

At the annual meeting of the Western Knitting Mills, Inc., earnings of $278,785.27 were reported for the fiscal year ended November 25, 1920. Total sales were $1,796,045.65, compared with $1,815,000 for the year previous. New equipment valued at $214,000 was added during the year, which brings the capacity of the factory up to $5,000,000 a year. The report states that the earnings practically cover a period of only eight months on account of the business depression. Officers elected are: Chairman, Joseph Weissenhach; president, G. C. Strauss; vice-presidents, W. C. Chapman and Stanley G. Miller; secretary and treasurer, Wallace G. Kay; assistant treasurer, G. J. Taylor.

WILLYS STOCKHOLDERS ORGANIZE

Holders of the first preferred and second preferred stock of the Willys Corporation are reported to have arranged to finance the completion of the new plant at Elizabeth, N. J. The committees proposed will also include the merchandise creditors.

PERE MARQUETTE INCOME

Gross earnings of the Pere Marquette Railroad Company for December amounted to $3,301,663 and net operating income was $203,928, compared with income of $83,324 for the same month in 1919. For the year the earnings were $40,722,268 and net operating income, $1,746,877.

LIFE UNDERWRITERS' CONVENTION

The Detroit Life Underwriters' Association will hold a convention, Tuesday, March 1, in the ball room of the Hotel Statler, at which more than 1,000 members and delegates are expected. An invitation has been extended to all life insurance salesmen in the vicinity of Detroit. Delegations are expected from Flint, Pontiac, Mount Clemens and from Chatham and London and Sarnia, Ont.

The chief attraction of the convention will be a speech by Orville Thorp, president of the underwriters' national association, on the subject of "Insurance to Cover the Inheritance Tax. Mr. Thorp is from Texas. Charles W. Scott, past president, also will address the meeting.

COPYING THE MICHIGAN LAW

A bill now pending in the state of Washington provides for segregation of deposits and resources of the savings business of banks and trust companies in that state. The general provisions of the bill are quite similar to those of the Michigan law, in that savings deposits are required to be invested in high grade bonds and securities. In case of liquidation the savings department would stand on its own feet and the apparent preference as to assets is offset by giving the bank a right to require notice of withdrawal. The bulletin goes on to state that the need for this new provision recently was forced upon the attention of the legislature by the failure of a large state bank which catered especially to savings depositors.

CONSUMERS POWER-MICHIGAN LIGHT

A comparative statement of 1920 earnings of the Consumers Power Company, which statement includes the Michigan Light Company, as filed with the Detroit Stock Exchange, shows gross earnings of $1,301,364 for December, 1920, compared with $1,141,829 for December, 1919. Surplus after dividends on preferred stock was $248,812 compared with $260,289 a year ago. For the 12 months ended December 31, 1920, gross earnings were $14,157,453, comparing with $11,439,094 for the preceding year. Balance after expenses, charges and preferred dividends was $1,427,256, against $1,762,632 at the end of 1919.

Accounts receivable	24,724	4,046
Notes receivable	39,154	14,879
Advances on contracts	.....	5,970
Merchandise inventory of raw material, trucks in process, finished trucks and service parts at cost or market	489,674	155,376
Real estate, building lease, machinery, tools and equipment less depreciation	67,476	60,492
Prepaid expenses and supplies chargeable to future operation	176,525	98,494
	$801,001	$373,904

LIABILITIES

Accounts payable	$ 25,188	$ 17,845
Notes payable	85,929	19,874
Dealers deposits	.....	964
Capital stock, preferred	19,300	.....
Capital stock, common	578,676	297,087
Partial payments on stock	25,320	18,790
Surplus	69,588	19,347
	$801,001	$373,904

Company reports that the annual meeting January 28 was attended by more than 300 stockholders. Directors elected are as follows, with officers indicated: President, W. J. Chase, Traverse City; first vice-president, W. G. Rath, secretary-treasurer; C. D. Peet, general manager; E. G. Arntz, L. W. Smith, Frank Brooker.

A noteworthy feature of the comparative statement is the growth in assets from $373,904 to $801,001. Current assets are five times current liabilities. Napoleon was fortunate that it increased capital stock rather than bank loans. The regular preferred dividend on the basis of 8 per cent will be paid in cash, while a dividend of 10 per cent on common was paid in the form of 8 per cent stock and 2 per cent in script, the latter payable August 1, 1921.

D. & C. STATEMENT

Following is a condensed comparative balance sheet of the Detroit & Cleveland Navigation Company. Cents have been omitted:

ASSETS

	Dec. 31, 1920	Dec. 31, 1919

GRANGE LIFE ELECTS OFFICERS

The annual meeting of the Grange Life Insurance Company was held in Lansing last week. Reports showed more than $5,500,000 worth of new business for 1920. The officers are: N. P. Hull, president; Frank Coward, Bronson, vice-president; C. H. Bramble, secretary; S. H. Clink, Muskegon, general counsel; Dr. J. W. Glover, Ann Arbor, consulting actuary; Dr. H. A. Haze, medical director; Maude Gitchell, auditor; Doris McDonald, resident actuary; I. D. Wallington, superintendent of agents. J. Edward Roe and R. Bruce McPherson were added to the executive committee. The directors were re-elected.

EDMUNDS & JONES STATEMENT

ASSETS

	Dec. 31, 1920	Dec. 31, 1919
	(Cents omitted)	
Cash on hand and in banks	69,315	194,893
Accounts receivable, less reserve	292,711	495,194
Inventories	842,621	843,687
Victory bonds and other investments	18,066	22,900
Plant accounts, less depreciation reserves	990,940	960,558
Patents	1	1
Deferred charges	36,726	25,529
Other investments	.....	1,316
	$2,347,382	$2,358,080

LIABILITIES

Accounts and notes payable, etc.	$ 492,925	$ 325,498
Reserve for federal taxes	39,821	14,234
Uninvested balance of reserve for redemption of preferred stock	12,026	7,950
Capital, preferred, less redeemed	843,200	856,100
Surplus, being book value of 46,000 shares of common stock, without par value	959,409	1,016,997
	$2,347,382	$2,385,080
Surplus at beginning of period, Jan. 1, 1920	.....	$1,016,997
Add profit for the year	.....	37,768
Less taxes in dispute reserved	$ 14,782	$1,114,766
Reserve for pref. stock redemption	304	.....
Preferred dividends paid	60,870	155,857
Common dividends paid	80,000	.....
Surplus carried forward		$ 958,909

President Edmunds states in his annual report that profits as shown were made not withstanding the loss absorbed in pricing inventories on a conservative market value. The year's profits are slightly less than for 1919, but dividends have been paid at the regular times on both preferred and common, and $47,200 of preferred was purchased for redemption, making $156,800 total redeemed to date. He summarizes the situation by saying "with a revival in trade the possibilities are as good as ever they were."

Who's Who In Michigan Finance

George B. Judson, Vice-President, Bank of Detroit

George B. Judson is the son of a locomotive engineer and has risen to his present position by means of hard work and plenty of it. Born in Butler, Ind., a railroad town, he spent his grade school days at Ashley, Ind., and then came to Detroit, where he graduated from high school. The next few years were spent in various clerical jobs around the city, but it was always a consuming ambition of his to be a banker; so when the Highland Park State Bank was opened in 1909 he applied for a position as a clerk, which was obtained. During the next three years he worked at various positions in the Highland Park bank and was made branch manager of the Richton branch in 1912. In 1915 he was elected assistant cashier of the Highland Park State Bank. Judson has a way of hanging on to things he wants, which drew the attention of the directors of the then Highland Park State Bank of Detroit, and in December, 1917, he was made cashier of the latter and subsequently in March, 1919, vice-president. At the annual meeting for 1921 election of directors he was added to the board.

GEORGE B. JUDSON

In looking back over his banking career Mr. Judson puts much stress on the many hours of reading which he has done as accounting in large part for his success.

PACKARD DIVIDEND

The Packard Motor Car Company, Detroit, has declared the regular quarterly dividend of 1 3-4 per cent. payable March 15, 1921, to stockholders of record February 28.

THE OLDEST HOUSE IN MICHIGAN

FOREIGN INVESTMENT BONDS

The discerning American investor today has an exceptional opportunity to purchase from foreign investors, issues of government, provincial and railway bonds which were sold in Europe prior to the war. The loans made in Sterling and Francs which were sold in England and France yield a higher return than the dollar loans recently placed in this country and they further offer attractive profits from constantly rising exchange. These bonds have an active market, and interest and principal may be collected as easily as that of any domestic issue. We have four issues of this kind which will prove interesting to the conservative investor.

Spades Are Trump

(*Continued from Page 5*)

These figures are sufficient to give an idea of the purchasing power of the automotive industry, and by comparing the car ouput of the five states mentioned on the one hand, and of Michigan alone, on the other, the concentrated purchasing power is revealed in its amazing volume. The extent to which these automotive plants were overloaded with materials, parts and accessories in 1920 as a result of the sudden damming of the buying tide may never be known, but the figures undoubtedly would show one very good reason for slow purchasing for 1921 production.

The peculiar concentration of the motor car, truck and tractor industry in the district comprising Michigan, Wisconsin, Ohio, Indiana and Illinois gives this district world importance. It may almost be said that its entrance or exit from the materials market gauges the general industrial situation.

Figures From Other Quarters

The survey of the National Automobile Chamber of Commerce for 1919 gave the total number of motor vehicle manufacturers in the country as 346, located in 31 states. The leading states were as follows:

Michigan, 66; Illinois, 54; Ohio, 40; Indiana, 34; New York, 31; Pennsylvania, 31; Wisconsin, 14; California, 11; New Jersey, 9; Missouri, 7. The other states were as follows: Colorado, 3, District of Columbia, 1; Georgia, 3; Iowa, 5; Kansas, Kentucky and Louisiana, 2 each; Maryland, 1; Massachusetts, 6; Minnesota, 6; Nebraska, 2; Texas, Virginia and Washington, 2 each; New Hampshire, North Carolina, Oregon, South Carolina, Vermont and West Virginia, 1 each; Oklahoma, 4.

As will be seen by the figures, Michigan, Indiana, Illinois, Ohio and Wisconsin together had 208 of the 346 manufacturers, or 60 per cent. The Automobile Trade Directory for 1920 gives a total of 456 manufacturers of passenger cars, trucks and tractors in the United States, 251 of them being located in the five states before mentioned, and allotted as follows: Michigan, 68; Illinois, 57; Ohio, 55; Indiana, 39, and Wisconsin, 32, which gives these states 55 per cent of all the truck, passenger car and tractor plants in the United States.

In almost every state in the Union there is produced some raw material or semi-finished or finished commodity directly or indirectly used in motor vehicle manufacture. Therefore it is not going far afield to say that at least 50 per cent of the selling effort of the makers of parts, accessories and materials will be directed upon the district comprising these five states, and the position of the purchasing agents of the automotive plants in these states consequently is not to be underestimated. What they will expect in prices, policy and quality from the concerns selling them goods will set the mark for the whole automotive industry.

The sellers of materials, parts and accessories for cars, trucks and tractors can ill afford to leave any stone unturned in winning a firm foothold in this field. The fight will be bitter for two reasons: First, the increase in competition resulting from a lessened demand for product following curtailed production of vehicles will have the same effect as would result if the number of concerns providing materials suddenly increased two-fold, and, second, the mental attitude of the purchasing agents themselves.

1921 Production Estimates

To what extent the demand for materials will be cut is open to conjecture. One purchasing agent well qualified to speak estimates a 60 per cent production compared with the 1919-1920 output, but is not at all sure of so high a figure. Motor Age estimates the replacement requirements in the truck and passenger car market at between 1,000,000 and 1,100,000 vehicles in 1921. If the 60 per cent estimate

A Detroit Investment Yielding 7%

One of the big advantages in investing in the **Clayton & Lambert Manufacturing Company's** First Mortgage Bonds is that this is a local company which has been in business here for thirty years—consequently, it is well known and its securities are easily investigated.

When you invest in these Bonds you are not put to the necessity of obtaining information from out-of-town sources. The land and buildings, machinery and equipment are where you can easily see and judge them for yourself; also, the men at the head of the concern are well known in Detroit.

The bonds mature in from two to ten years and can be purchased at a price that will yield 7% on your investment. The Bonds are Tax Free in Michigan and the 4% Federal Income Tax is paid by the borrower. The denominations are $100, $500 and $1,000.

are demanded nowadays in banking almost as insistently as safety. The Dime Savings Bank recognizes and provides for all modern requirements of an essential and beneficial character. We regard it a privilege to confer or correspond with financial institutons or business houses regarding their Detroit and other Michigan banking needs.

Capital and Surplus $3,750,000

holds good, then the 1921 production will not exceed 1,344,600 cars; and if Michigan continues to manufacture 83 per cent of the total, it is not difficult to imagine the character of the selling campaign necessary on the part of every concern that has something to sell the industry.

Some of the figures on raw materials used in motor car manufacture are interesting. They are taken from Iron Trade Review. The average copper per car is 36 pounds, the total amount used by the automotive industry being about 4 per cent of the entire production. The amount of brass used in 1919 was 75,000,000 pounds, or 7 per cent of total production. Aluminum leads all the metals, more than 60,000,000 pounds, or 50 per cent of total production being used in motor vehicle construction.

Despite the fact that a certain make of car is often called a "Tin Lizzie," the most of this metal used in any car is 7.5 pounds, the total consumption being about 13 per cent of the total amount imported. There are 10.5 pounds of manganese used on an average, while from 925,000 to 1,150,000 tons of steel and iron are fabricated into motor cars. The zinc content runs about 7 pounds to a car, or 1.5 per cent of total production.

Aside from the raw materials, parts and accessories used by the motor car industry there is the enormous volume of machinery, shop equipment and tools. During the period of high production and plant expansion a great quantity of equipment was purchased, probably enough to last for some time. Replacements, however, are constantly necessary. Changes in models call for new tools and equipment, while the wear and tear on machinery is heavy. Therefore, even with a reduction of 50 per cent in production, the demand for parts, supplies and accessories will continue to be great.

Competition in this field is keen because the success of the automotive industry has brought into existence any number of metal, wood, cloth and rubber working industries, which to the motor vehicle industry are like the tail pieces of a kite. They will stay up so long as the kite stays up. There are kites without tail pieces which have no difficulty in flying. Apparently inventive genius discovered that tail pieces were not necessary to a kite.

The merger of motor car companies into huge combines, which seems more than probable as the years go by, will tend to narrow purchases. Poor salesmanship and bad practices will make hard sledding for parts, materials and supply concerns, so that survival in this fertile field will depend entirely upon a scheme of reconstruction of manufacturing and sales policy, although, of course, fundamentally on aggressive lines.

The Lathe Family

(Continued from Page 10)

tool rest. While one diameter is being turned automatically by the tool of the carriage, the other diameter is turned by hand with the auxiliary tool, producing a completed piece in the time of doing the one operation.

Figure No. 5 shows how a tool is held in the tool post of an engine lathe for boring a hole. In this particular instance a Universal Relieving Attachment is being used to bore and relieve a die. This attachment is not used, however, when a straight, round hole is to be bored. If the hole is to be reamed, the reamer usually is forced through the hole by means of the center in the tailstock. This is a rather laborious operation and work which has to be bored and reamed usually is done on a turret lathe. Probably no one machine deserves greater credit for helping along the movement toward rapid production and consequently the reduction of cost of manufactured articles than this machine. Its characteristic feature is found in the turret, which is made to bring in quick succession a number and variety of cutting tools to act on the piece which is held in the chuck. The turret is mounted on a slide parallel to the line of the spindle of the machine, and occupies the same position as that of the tailstock on an engine lathe. It is made to slide on the base, either automatically or by a hand wheel. After the tool, which is held in one of the radial holes of the turret, has performed an operation on the piece, the turret is moved back, and is made to rotate automatically, thus bringing another tool in line with the work. The Warner & Swasey Company, Cleveland, is one of the country's formost manufacturers of turret lathes.

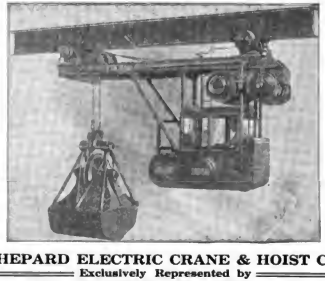

Figure No. 6 shows the operation of machining a differential carriage on a Libby lathe in the Clark Avenue plant of the Studebaker Corporation, in Detroit. The piece is bored, tapped and faced in this operation, the boring and tapping tools being held in the turret and the facing operation being done by a tool on the cross-slide. Approximately 60 of these pieces are turned out on one machine in a day, which is probably ten times as many as could have been produced on the machines of 20 years ago. Valve plugs, piston pins, radiator caps, hub caps, carburetor parts and various other parts of automobiles and other machinery usually have one or more operations performed on them in the turret lathe.

High-Speed Machines

The necessity for the production of smaller parts such as valves, pushrods, piston pins and similar parts in large quantities has resulted in the development of small but sturdily-built high-speed machines. The Multi-Cut lathe made by the R. K. LeBlond Machine Tool Company is a good example of this type of machine. While these machines are semi-automatic, they are essentially lathes in every respect, for they have the lathe characteristics and use lathe tools of the simplest form. The closest operations can be performed on them and the class of operator required can be easily replaced. The work may be centered, held on mandrels or in chucks on either the pneumatic or hand-operated. On work that has been previously bored, reamed or rough-turned on the turret lathe or automatic, leaving an operation of finish-turning or facing to be done, the Multi-Cut lathe finds its legitimate field. Gear blanks, bevel gears, pistons, piston pins, steering knuckles, small shafts and similar parts are rapidly turned and faced. Lathes of this description usually are operated in "gangs"—that is, one operator tends two or more machines. The automatic operation of the turning and facing slides and automatic trips make this readily possible, the operator loading extra mandrels while the cut is in progress.

The Reo Motor Car Company, Lansing, uses a number of Multi-Cut lathes for turning aluminum alloy pistons. One operator runs two machines, one roughing and one finishing. The

pistons are roughed all over, and ring grooves are cut in the first operation, which takes 30 seconds. The piston is then removed from this machine and put into the second lathe. Here it is finish-turned and the ring grooves are cut to the proper depth and corners squared. This takes 20 seconds, so it is obvious that two roughing machines can keep one machine busy on the finishing operation. This company has six of these machines on this operation, producing approximately 2,800 pistons a day, which is the number required for the normal output of Reo automobiles.

The Porter-Cable Lathe is another lathe of small but exceedingly strong construction for the production of interchangeable parts in large quantities. The Hudson Motor Car Company uses this machine for turning piston pins. These pins are made of 3½ per cent nickel steel and are drilled through the center, rough turned and cut off before coming to the lathe department. They are finish turned in the Porter-Cable lathe at the rate of 15 seconds each, or 200 an hour. The tool travels across the piece at a rate of 1-32 inch per revolution of the pin, and the pin revolves at a surface speed of 360 feet a minute. Considering the high grade of the metal used in these pins, this is an extraordinary feat.

The Reed-Prentice lathe is another machine of this description. The Ford Motor Company, which is not given to taking unnecessary time in the production of automobile parts, has a number of these lathes which it uses for turning bronze bushings. Four men and three lathes constitute a "gang" in this instance, working as follows:

The first man picks up a bushing, places it on an arbor and presses the arbor into it a definite distance, using a No. 2 Ferrachute pnnch press for this operation. He drops this bushing, containing the arbor, into a gravity conveyor, on which it rolls to the first turning operation. Here the operator puts it into the lathe and rough turns it, after which he drops it into another gravity conveyor, down which it rolls to the next machine. The operator here puts it into the machine and finish turns it, passing it along to the man on the next machine, who faces the ends, using a gang tool which is never moved from its position. The fact that the arbor was pressed a certain definite distance into the bushing simplifies this process greatly. The bushing is now transferred back to the press operator, who removes the arbor. The interesting part of the pressman's job is that he always has two bushings under the press, one having an arbor pressed out and one having an arbor pressed in. These bushings are of bronze, two inches long and 1½ inch in diameter. These men produce 400 complete bushings an hour, or 3,200 a day.

STEARNS' YEARS' BUSINESS

At the annual meeting of the stockholders of Frederick Stearns & Company, Detroit, last week, Willard Ohliger, general manager, reported that sales for 1920 exceeded all previous records and the net earnings were equal to those of 1919. In addition to the regular dividends, a stock dividend of 66 2-3 per cent was paid to the common stockholders during the year. Directors elected were: Frederick K. Stearns, Willard Ohliger, David M. Gray, Frederick S. Stearns, Standish Backus, Earl Warner, H. M. Avery, J. R. Worden, J. C. White, C. M. McClure, and C. E. Jamieson.

Officers: President, Frederick K. Stearns; vice-president and general manager, Willard Ohliger; second vice-president and treasurer, Frederick S. Stearns; secretary, D. M. Gray; assistant treasurer, Earl Warner; auditor, M. Graham.

GENERAL MOTORS ACCEPTANCE CORP.

The balance sheet of the General Motors Acceptance Corporation, as of December 31, 1920, shows assets of $35,560,780, as against $16,540,423 a year ago, and surplus of $947,203, as compared with $500,884 on December 31, 1919.

INVENTORY VALUATION

For Federal Taxation and Banking Purposes

Free on Request

FEDERAL Income Taxes are now engaging general interest. It was not strange, therefore, that when we published an authoritative discussion of Inventory Valuation in a recent issue, that there should have been a demand for copies which exhausted the supply and required us to prepare reprints.

The article was an extract from an address made by William M. Lybrand, President, National Association of Cost Accountants, before the January meeting of the Detroit Chapter of that Association.

The opinion and judgments of a specialist and unprejudiced observer on this important topic is presented. We want every banker, manufacturer, accountant, attorney and merchant to have a copy, which is why it was reprinted in booklet form for general distribution.

Inventory Valuation will prove helpful to those who seek or give credit, plan for the future or are concerned with the preparation of Federal Tax returns.

It summarizes principles of valuation that have stood the tests of time and that are governing in the present conditions.

Copies will be mailed free on application to

Miniature Detroit Salon A 1921 Show Week Feature

Detroit is to have a 1921 motor car salon in miniature, as well as a show, three representative makers of automobiles having taken lobby space in the Hotel Statler, where they will exhibit special body jobs, in addition to their displays at the show, the week beginning March 19.

Thirty-nine members of the Detroit Auto Dealers' Association have drawn allotments of space at the show, which will be held in the new Morgan & Wright manufacturing building, in Jefferson avenue. Only one member of the Association did not take space. The remaining floor room will be apportioned among other passenger car and truck dealers and accessory manufacturers.

The firms drawing space follow: Acason Motor Truck Company, Baker-Fisk-Hugill Company, Bemb-Robinson Company, W. D. Block Motor Company, Buick Motor Company, Cadillac Motor Car Company, Chevrolet Motor Company, Denby Motor Truck Company, Detroit Electric Car Company, Detroit-Oakland Company, W. J. Doughty, Thomas J. Doyle, Ford Motor Company, Frank M. Foster, Frank P. Gmein Company, Knight Motors, Inc., Lafayette Distributing Company, Michigan Oldsmobile Company, Miller-Judd Company, L. F. Mullin Company, A. H. Murray, Nash Distributing Company, William F. V. Neumann & Sons, Owen & Graham, Packard Motor Car Company, Paige Sales & Service Company, Potts Motor Sales Company, Reo Motor Car Comany, Scripps-Booth Corporation, Ralph F. Schneider, Seizel-Zeckendorf Company, Simcoa Sales Company, Smith-Glines Sales Company, Studer-Stone Company, Inc., Studebaker Corporation, Thompson Auto Company, Wagner Bros., Inc., Weisman Motor Sales Company, Williams & Hastings, Inc., Harvey G. Wilson, M. A. Young and George H. Zuver Company.

TRAINING FOR PERSONALITY

The Indiana Manufacturers' Association has appropriated $3,000 to the engineering schools of Purdue University, Lafayette, Ind., for "the development of student character and personality," according to announcement made by Dean A. A. Potter, of the schools of engineering. The first check for $1,500 has been received and work begun to put in operation the system for which the fund is desired.

An association committee recently visited the engineering shops and laboratories, talked with various professors and saw how the instruction had a direct bearing on the prosperity and comfort of Indiana people. The members were especially impressed with the interest taken by the professors in the welfare of each student and the great amount of personal attention given each man, which was limited in certain ways because of the lack of funds. Because of this, the Association made the gift.

In the new rating on personal traits, the following factors will be considered: accuracy, co-operative ability, disposition, industry, initiative, judgment, leadership, mental caliber, personal appearance, physique, popularity, sense of responsibility, speed, system and tact.

BROWN, PRESTON & DERRICK

Robert O. Derrick, architect, formerly with Murphy & Dana, architects, New York, has been admitted as a partner to the firm of Brown & Preston, architects and engineers, Detroit.

The firm has been incorporated under the name of Brown Preston & Derrick, architects and engineers. J. Martin Brown, is president; Robert O. Derrick, vice-president, and Martin A. Preston, secretary-treasurer. Wm. E. Irving, for some time connected with the firm, has been made director of business promotion.

The present offices will be retained at 406-407-408 Empire building, Washington boulevard, at Clifford street.

FINANCIAL RECORD

Borrower vs. Banker

In Which the Defense's Case Is Submitted to the Jury; An Explanation of the Load Carried to Sustain Industry

By PHIL S. HANNA

EVERY FEW DAYS there appear in the press encouraging statements about the condition of the money market. In the main the statements come from individuals who are in a position to know true conditions, but unfortunately it is seldom brought out, in connection with the remarks quoted, that while there is much improvement money-wise and that fundamentally our financial fabric is on the mend, the equilibrium which permits our banks to make new loans is not yet established. It is true beyond doubt, as Governor Harding, of the Federal Reserve Board, has pointed out often of late, that the danger of a money panic has passed and that in fact the crisis has passed, but a study of the figures brings out the fact that there is yet the necessity of much liquidation of loans already existing or the people must make new and increasing deposits before the banks of Detroit will be in position to take up in any volume the financing of building and other new enterprises.

The bankers testify that every time the statements about improved financial conditions appear in the press they receive immediately an avalanche of applications for mortgage and building loans and that they must then go into long and tedious explanations. Often the customer goes away with the feeling that the bankers are not sincere and the sentiment has been expressed in some cases that the banks are purposely withholding credit in order to get high rates and the like. Another element, hardly learned that the banks may borrow from the Federal Reserve Bank, urge that such borrowing should be continued, and it is not clear to them why new loans are refused inasmuch as the banks belong to the system and have recourse to borrowings and rediscounts at the reserve institution. Yet in spite of the fact that the principles of safe banking have not changed since the fourteenth century, many would have the banks change the rules of safety which have been wrought out of six hundred years' experience in lending the other fellows' money.

Law of Averages Fundamental

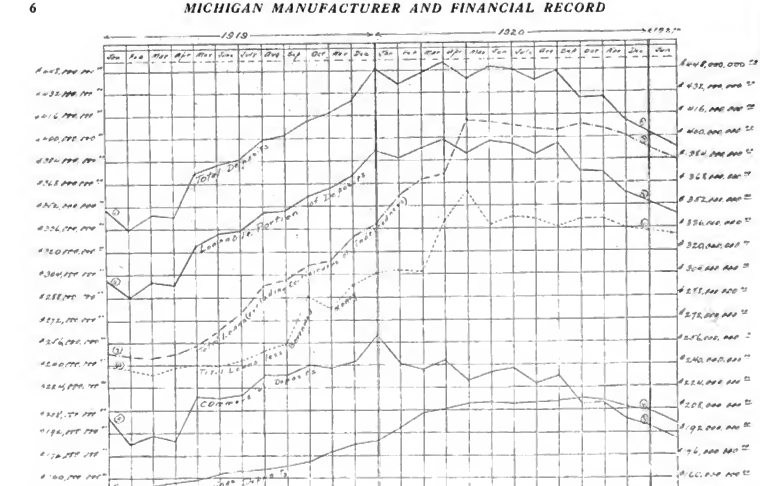
In the beginning a banker merely gave a receipt for hard money and his function was strictly one of safekeeping. So he found that his customers would not ask for the return of their money at one time and that he could lend out a part of the hard metal and yet have enough on hand at all times to meet the withdrawals of those who called for the return of their metal or coins. Experience taught the banker of those days that there was a certain law of averages beyond which he could not go in lending the money left with him, and the banker who kept within the established law of averages was a good banker, and he who took a chance and loaned out too much was a poor banker. Then came the use of checks and book credits, but nevertheless the law of averages continued. Today this law is determined by Congress and the state legislatures, and it is noteworthy that the law has been changed from time to time as experience has dictated that reductions in reserve percentages might safely be made. Experience also pointed out that there must be an emergency source of money in times of widespread disturbances, and after thirty years' study and effort Congress created the Federal Reserve Banks. The title of the bill creating the system of reserve banks reads something like this: "In order to provide a more elastic currency," etc. Well, the country got just exactly what was needed, i. e., an elastic currency, and along came the war and currency began to stretch. After the Armistice there was a slight contraction, but it was not for long, for with the wild expansion of business which began about the first of 1919 there had to be additional currency and, as prices mounted, still more was needed, until a few men not interested primarily in private profits began to wonder whether the elasticity of the reserve system were not stretched about as far as it was safe to stretch it. So those men ran up a storm signal and also applied the restraint known in older countries than ours as higher discount rates. And again there was, and continues, a misunderstanding about the function of increasing discount rates.

It is the writer's belief therefore that a lucid delineation of the problems that have beset the banks during the last two years, told from the banker's point of view but with a good conception of how the situation has looked to the borrower, and supported by figures of loans, deposits and borrowings by the banks, will go a long way toward setting the average business man right as to the motives of the banker, and will, moreover, be of much assistance to everyone who is groping around in the dark, so to speak, for a guide to the future.

There is much difference of opinion among economists as to the part that credit control plays in industrial crises, for banking is far from being an exact science, but with every crisis that has occurred during the last six hundred years the same lesson has been brought home, and that lesson is that every so often the people want to see the color of their money. If they find they can get it, they don't want it. If it is refused, they want all the more. But, thanks again to the Federal Reserve System, it hasn't been necessary, except in a few instances (and those are a long way from Detroit) to refuse anyone the return of his money on demand. Nevertheless there has existed since along in the latter part of 1919 a good reason why new loans should be refused, notwithstanding the urgency of the housing situation all these months and in spite of the fact that during that period coin and currency was always available.

But, you will say, during the last six or eight months of depression we have always been able to see the color of our money, and still business has not improved and we can't get new loans. Yes, that is true, and for a good reason. The Federal Reserve machinery removed the occasion for anyone to become excited, because it actually keeps in hard money enough to supply any emergency and it also has the power to issue money, but when the amount of promises to pay held by the banks gets out of proportion to the amount of deposits the people have in banks, and when the proportion of hard money falls below a percentage based on six hundred years' experience, as a safe limit, then the automatic governor begins to work. Its operation is precisely like a centrifugal brake on an elevator and its power of prevention of worse consequences than a sudden jar is also quite similar. If everyone were as mindful of the financial lessons of history as a safe banker is required to be, inflation of credit would never occur to any extent. Mr. Borrower would study the Federal Reserve reports and upon noting that the gold reserve ratio to notes in circulation and deposits had dropped below 40 per cent he would call on his banker and say: "John, I had intended to expand my factory, but seeing as how the gold ratio is running off, I'll put off borrowing until the people save more money or until some other fellow pays his loan." And everything would be lovely indeed.

But He Doesn't Do It



But those things never happen. Mr. Business Man sees a chance to make money by borrowing, so he wants to borrow and doesn't care a hang about reserve ratios so long as he can get the money. The bank is open and doing business, and what is a bank for, anyway, he says!

Yet don't forget that the banker wants to make money, too, and he can't make it if he doesn't lend to you; but when reserves start down and loans start up he begins to weigh the profit in the loan against consequences, and fear of consequences is the one thing in banking that steers the banker away from consequences. It is one of the chief reasons why banks outlive the average business enterprise and why bank stocks as a class are safe and enduring investments.

So much for stating the case. The managing editor, who in this entitled cause of action plays the part of the judge, has not so far restricted our remarks. And to the readers, who are the jury, we shall now address arguments in defense of our clients, the bankers.

Better to illustrate our arguments, we have prepared the accompanying graphs, which show, 1, the amount and course of total deposits; 2, the amount of deposits which were loanable after deducting an average of about 15 per cent for reserve (including legal reserve with the Federal Reserve Bank); 3, the amount and course of loans (excluding U. S. Certif-

Digitized by Google

cates of Indebtedness); 4, a graph to show what the loans would have been had the banks been unable to borrow as they did from the Reserve Banks; 5, the amount and course of commercial deposits; 6, the amount and course of savings deposits, and, 7, the amount and course of borrowed money obligations. Aside from defending our clients against the allegation that credit has been arbitrarily withheld, we intend to show the jury that there can be no general granting of new loans until the equilibrium between deposits and loans is restored and the stretch that was taken out of the banking machinery put back in again so there will be some available expansion for the next emergency some seven years hence.

Beginning at the left hand margin January 1, 1919, we find the Detroit banks with $351,000,000 of deposits and $249,000,000 of loans and only $10,000,000 borrowed from the Reserve Bank. The loans were actually somewhat higher due to holdings of U. S. Certificates of Indebtedness which are not included in these figures, but the point is that there was no strain to speak of on the credit of the banks and there was a comfortable margin between total loans (Graph 2) and the amount of loanable deposits (Graph 2). This was the period following the Armistice, when all looked for poor business, and, until February 1, 1919, as the course of Graphs 1 and 3 show, the tendency was downward. Then came revival and throughout the remainder of 1919, except in March, deposits (1) and loans (3) raced upward. Borrowed money likewise went upward (7), but the influence was due in the main to the preferential Federal Reserve Bank rate on loans secured by U. S. Certificates of Indebtedness. The Government was putting out large batches of certificates which the banks were asked to take, but instead of using their surplus funds to carry the certificates, the banks commonly took them over to the Federal Reserve Bank and borrowed nearly enough on them to pay for them and at a rate which practically made the interest from the certificates pay the interest on the loan. When the certificates came due the loans were automatically paid. Thus during most of 1919 the Federal Reserve Banks in many instances took the load of carrying certificates off the hands of the banks and the banks were enabled thereby to lend an equal amount to their customers, without cutting into reserves.

Curves 1 and 3 follow substantially the same trend throughout the year and the margin between total deposits and loans to customers remained practically constant. Note total deposits January 1, 1919, $351,000,000, against total of the same, January 1, 1920, $449,000,000, a gain of $98,000,000 and a gain in loans of $90,000,000 between the same dates. But the first two months of 1920 saw a slight recession in deposits and simultaneously there was an abrupt loan demand (see curve 3), loans went up $32,000,000 while deposits went down $4,000,000, and at this point the banks were obliged to borrow to take care of their customers. During March deposits came back a little, but on April 1 the real show began. During April

The Legislature and the Trucks

Some of the Bills Recently Introduced at Lansing Would, if Enacted, Put Hobbles on an Industry

ALTHOUGH 60 per cent of the motorized commercial vehicles manufactured in this country are made in Michigan, 75 per cent of the state's production is sold and used within the commonwealth and thousands of Michigan residents derive their livelihood directly or indirectly from the manufacture or use of these vehicles, some of the state's legislators apparently are determined either to legislate the motor truck out of existence or hobble it with costly and unnecessary restrictions.

Several bills directed at the motor trucking business already have been introduced in the present Legislature and no one knows how many more are to appear before the end of the session. Had the promoters of some of these bills deliberately set out to kill a business by halting the use of its product, they could have chosen no better time to attack the motor truck industry.

However, there is no evidence of malicious intent to curb the use of motor vehicles in the state. It is more likely that ignorance of their economic value and the conditions necessary to their encouragement and development are responsible for the attempts to encumber them with inimical legislation. Also it is apparent that the men in question have forgotten how important the success of the motorized commercial vehicle is to the industrial welfare of this state, and the economic reaction upon the public which surely must follow economic hardships thrust upon manufacturers and users.

Two Factors Enter

Legislative action so far asked is prompted by two factors which have come into controversial prominence since the advent of the motorized commercial vehicle. One is the destruction of highways which never were constructed for heavy duty vehicular traffic, but which, if they are to be of economic value to the districts through which they pass, must carry utility as well as recreational traffic. The other factor is born of the desire on the part of some people for unrivaled and undisturbed possession and use of the highways by passenger cars. There is in this phase of the problem an element which smacks of social distinction. The motor truck, no matter how well appearing, powerful and useful, is still a "cart" in the minds of so many tourists who have in their thoughts only the pleasurable use they can make of their motor vehicles.

These two causes stand out prominently. If there is in the background an encouragement for inimical legislation arising from threatened competition between the commercial vehicle and other units of transportation, it is well concealed.

In 1919 motor trucks moved 1,200,000,000 tons of freight, becoming second only to the railroads in tonnage. Much of this tonnage the roads could not move; some of it they undoubtedly lost because of the quick transportation provided by motor equipment. Up to a year ago a railroad in Michigan handled from four to five less than carload lot daily shipments between Detroit and Pontiac. Before the present industrial depression changed the aspect of things, this railroad was handling only one L. C. L. shipment every other day between these points.

Had this railroad, or any of the other roads, desired to take a tuck in the creeping ambitions of the trucking business, they could have asked no better weapon than House Bill No. 142, introduced by Rep. Danz, of Monroe, which increases the weight license fee on trucks from 35 cents a hundredweight to $1, an increase of more than 150 per cent, and increases the trailer fee from 50 cents to $1 a hundredweight. The fee of 25 cents a horsepower is left intact.

The only reason for this bill, so far as the printed word shows, is the fact that trucks have cut up the Dixie Highway within the confines of Monroe county. The county officials are much wrought up about the damage to the road between Monroe and Toledo, the blame for which they lay exclusively to the motor truck and trailer. Under the guise of making the trucking business pay for road construction and repairs, the Monroe agitators desire to punish the trucking business. While such a tax would, in a measure, be retribution to the trucks and trailers that traveled over and perhaps damaged Monroe's soft-soil, inadequately constructed road, why should all the trucks and trailers throughout the state be punished?

A Contrast in Roads

Wayne county's piece of the Dixie highway was built long before the Monroe section, yet Wayne's stretch seems to have stood up well under the traffic, which leads to the assumption that there is a great difference in road building, and Monroe has suffered by comparison. It also would seem wise to ascertain to what extent tractor and farm machinery contributed to the destruction of the Monroe highway. They are not considered conducive to road longevity.

It is estimated that not 10 per cent of the trucks and trailers in use in the state travel the highways in long-haul work, and not that percentage have as yet "crammed up" Monroe's piece of road. Consequently most of the trucks and trailers must traverse roads within city and town limits; in fact the great majority of them are used by commerce and industry within a 10-mile radius. Why then should the truck and trailer the most useful and economic short-haul medium? Why should every person who sets himself up in the motor transportation business because there is a demand for his services in that capacity be so taxed that he cannot make a living?

As was said before, if any man desires to kill off an industry, no better time could have been chosen. Truckmen with motor equipment are lingering on the edge of despair at this time. Some of them cannot meet the notes on their equipment; many who had a prosperous business months ago have little or no business now; some have not been able to pay their license fee. These men, and thousands of others like them, have made and will help to make the motor truck manufacturing industry of Michigan possible, provide work for labor for money and facilities for ready distribution unless a few legislators succeed in throttling them.

What Really Is Needed

What is needed is not legislation to tax the truck business out of existence to provide money for roads for passenger vehicles, but a change in roadbuilding methods that will lead to the construction of the kind of substantial highways this country and state need to meet new transportation conditions. Owners of motor trucks already pay more than $15,000,000 a year in taxes of one kind or another, and these levies do not include state and municipal taxes. Rightly treated, the trucking industry

SPECIFICATIONS
On the New Ford Cow. Also a Cartoon

—Reid in the New York Mail

THE NEW "LIZZIE"

(H. I. Phillips in the New York Globe)

MR. FORD is very reticent about his Tin Cow, which will retail, probably, at $375 and up, F. O. B. Detroit, completely equipped, but with the usual charges if the buyer desires a spare set of udders with his cow and a deep bass moo-o-o. Our own correspondent has secured a Ford catalogue giving plans and specifications for the Ford cow. They follow:

1. Plain water fuel system. 2. Mileage: five quarts of milk to a gallon—of water. 3. Self starter for those wishing plain milk. 4. Cranking device for those wishing whipped cream. 5. Left or right-hand drive as preferred. Both hands, if you're a fast milker. 6. Special upholstery in the usual shades of cowhide. 7. Borden magneto. 8. Van Camp carburetor. 9. Two horns with each cow. 10. Complete tool kit, including hay fork, halter, stool, pail and switch. 11. No oil necessary except citronella on farms in regions where mosquitoes are apt to annoy the cow.

Guarantee—1. Each cow will be guaranteed for ninety days. 2. Any cow lolling apart before that time will be replaced. 3. Any cow found to have missing parts within that period will be provided with them upon receipt of complaint from the cow or from the owner.

Warning—1. To get plain milk, drive Ford cow on smooth road. 2. To get milkshake, drive at high speed over unpaved streets. 3. To get butter or cheese, drive Ford cow over a cobblestone road.

Important Note—The Ford Cow may not be authentic. It is possible it is just "bull."

Investing in Prosperity

Purchase of Securities of Foreign Trade Financing Corporation Will Help Avoid Business Demoralization

By DR. J. T. HOLDSWORTH
Vice President, the Bank of Pittsburgh, N. A.

PRELIMINARY estimates by the Department of Commerce indicate that our foreign trade for the calendar year 1920 will show more than $8,000 million of exports and approximately $5,400 million of imports, leaving the year's balance of trade in our favor at about $2,700 million. In 1919 our total exports were $7,920 million and our imports $3,900 million, giving a favorable balance of $4,000 million, or almost 48 per cent above the estimated balance of the last year. It appears that the value of our total exports will be strictly in excess of those for 1919, while our imports will show an increase of almost 50 per cent. These foreign trade totals should be compared with those of a typical pre-war year, say, 1913, when our total trade aggregated slightly more than $4,000 million, with exports of $2,400 million and imports of $1,800 million, giving us a favorable trade balance of about $500 million.

As was the rule before the war, our trade balance against Europe exceeds that of the rest of the world. Despite the recent heavy decline in exports to Europe, 54 per cent of our exports are to that continent and 76 per cent of our imports are from other quarters of the world. In other words, our best selling markets have been where we bought the least and our largest purchases where we have sold the least. Prior to the war the United Kingdom absorbed the larger part of our European trade balance and during the war our sales to Great Britain equaled those of all the rest of the Continent. Last year, however, the Continent took the larger part of our exports —an indication that Great Britain has reduced to a minimum its purchases in America while the rest of the world is still very largely dependent upon us.

An Analysis of Exports

An analysis of the groups of commodities entering into our foreign trade in 1920 shows that in our export trade crude materials for use in manufacturing have been steadily growing in importance since 1917, although the percentage is still considerably lower than that of 1913. It appears also that exports in foodstuffs in crude condition and food animals showed a percentage of almost twice that of the year 1913. Foodstuffs partly or wholly manufactured dropped to about the same level as in the pre-war year. On the import side, a striking characteristic is the heavy increase in the value of foodstuffs partly or wholly manufactured, sugar playing an important role in this group. Imports of manufactures for further use in manufacturing and foodstuffs in crude condition show a similar percentage in 1920 than in preceding years. The striking fact emerges, however, that in the year 1920 the value of merchandise imported from Europe was nearly twice that of the preceding year and four times as much as in the corresponding period of 1916. The approximate total of one billion of total imports of manufactures ready for consumption is chiefly European. It also appears that in the raw material for manufacturing groups Europe is returning to its pre-war practice of accumulating the crude products before sending them to the United States.

Though the foregoing summary does not attempt an accurate analysis of the foreign trade situation, and lacks the sureness of completed statistics for the year, it points to the inference that in our future trade more emphasis must be placed upon the export of manufactured articles. Foreign demand for foodstuffs will, of course, be more or less continuous and for some time to come war-scarred Europe will need our foodstuffs as formerly. But with the ever-increasing home demand accelerated by the movement of population from the country to the urban center, the quantity of foodstuffs available for export may be expected to decline. The same conclusion may be drawn regarding crude materials used in manufacturing.

In the main and making reservations as to particular sections and peoples, Europe's recovery during the year 1920 has been fully satisfactory and it may be assumed that 1921 will see further economic improvement. With the recession of price levels all over the world, the total value of our foreign trade in 1921 no doubt will decline. Whether such decline shall bring with it decreased profit or sustained prosperity to the American manufacturer and to American business will be determined largely by our own sound business sense and acumen, and specifically by steady economic production and the extension to Europe, especially, of adequate credit to enable it to continue its industrial and commercial rehabilitation.

DR. J. T. HOLDSWORTH

DR. HOLDSWORTH is a noted economist who recently forsook the teaching of finance in the college classroom for the practical application of it as head of the Bank of Pittsburgh, N. A., of which he is now one of the vice-presidents. He has been in turn a member of the faculties of the Summer School of the South, Knoxville, Tenn.; Drexel Institute, Philadelphia, and the University of Pennsylvania. He was dean of the School of Economics, University of Pittsburgh, for several years prior to his becoming associated with the Bank of Pittsburgh.

Dr. Holdsworth, who is regarded as one of the authorities on the financial side of foreign trading in the Middle West, will be one of the principal figures in the convention of the National Foreign Trade Council, to be held in Cleveland next May 4, 5, 6 and 7.

"One fundamental concept of foreign trade must be borne in upon the American public, namely, that international trade is in the long run an exchange of products for products and that to maintain our export trade at high levels we must expect a higher level of imports. In this country our foreign trade thought has turned almost entirely upon exports and we have given little consideration to the encouragement of imports. But if we want to continue selling goods to Europe on a large scale and expect them to repay the enormous debt of 15 billion dollars they now owe us, we must be ready to accept freely their goods and services in return.

The Tariff Problem

It is highly important, therefore, that the whole tariff question shall be given the most thoughtful consideration and that our tariff policy shall be determined strictly upon the basis of economics and without political or partisan bias. We must keep in mind the fact that as we artificially cut off our imports by the imposition of high or discriminatory tariffs, we shall correspondingly reduce our exports. Of course we cannot lose sight of the service of the tariff as a revenue measure, nor can we disregard the advantage, if not the necessity, of imposing protective duties upon certain foreign articles, like chemicals and dyes, which would compete with our young, warborn industries entitled to the opportunity to justify their continuance in peace times. But in a general way it must be recognized that the war has left us in a new economic position and that as a creditor nation with exports enormously in excess of imports, a new attitude toward tariff and our import trade has become essential.

In this connection we may remind ourselves that as a consequence of international trade disturbances due to the war, there already exists, with no probability of early removal, an involuntary "tariff" against American exports in the form of highly unfavorable exchange rates against practically all foreign markets. Admitting frankly the improbability of a return to par of such exchanges as the ruble, the Austrian crown, even the mark and the lira, we must recognize our own important stake in the early restoration of the exchanges of those countries which are solvent and are normally large customers of ours.

The increasing difficulties in foreign trade—cancellations, moratoria, slow collections and the like—have discouraged some concerns with but slight or recent foreign trade experience. Such concerns have been prone to vote the whole business a failure and to withdraw within the supposed safety of domestic trade, ignoring the fact that our domestic business is undergoing the same painful processes of readjustment as have appeared in foreign com-

A Skin Game That's Legitimate

Leather Produced in Large Quantities in Michigan; The State Has 32 Tanneries, Investment $15,000,000

By HOWARD CAMPBELL

ACCORDING to Scripture, the first article of clothing was composed of one or more fig leaves, but from all available information this material was soon superceded by the skin of an animal, Father Adam probably having discovered that a good fit could be had with but little alteration, and that the quality was far superior. From that date to this, the manufacture of leather has held a place of ever increasing importance in the industrial world.

There is no doubt that the use of leather was a result of the natural inclination of man to employ the most available materials, and the treatment of animal skins to fit them for useful purposes is a practice which seems to have been followed wherever mankind existed. A granite carving, probably at least 4,000 years old, is preserved in the British Museum, in which several workmen are shown engaged in the making of leather. One is taking a tigerskin from a tub or pit, a second is employed at another tub, while a third apparently is stretching a skin upon a table. Embossed and gilt leather was found on a mummy of the ninth century, B. C., and other articles of goat leather which were made about the same time are still in a state of comparatively good preservation.

In China the manufacture and use of leather dates back to the remotest era of ancient history, and even among the natives of America and Australia the curing of skins was found to be well known and widely practised; in fact, there has been no race of people but has had some knowledge of this art.

Although it is certain that the process of vegetable tanning is exceedingly ancient, it is almost as certain that the curing of skins by smoke and by treatment with oils and fats was even more primitive. Processes such as these are still in use in many of the less civilized parts of the world, leaving us in little doubt as to the origin of leather manufacture.

For centuries the methods of tanning leather have varied but little, but the last hundred years have seen remarkable development along this line. The application of chemistry to leather manufacture and the introduction of modern machinery have transformed an art into a scientific industry, manufacturing a valuable commodity on a production basis. Quality has not suffered, however; indeed leathers are now being turned out which are of a finer quality than any ever produced by the more ancient and laborious processes.

Michigan is well represented in this industry, having thirty-two tanneries within its borders, some of which produce leathers that are known the world over for their excellent workmanship and fine quality. One of the largest of these, as well as the most noted, is the tannery of Carl E. Schmidt & Company, Inc., Detroit. This concern specializes in the finest grades of calf leathers, its product winning the Grand Prize at the Panama-Pacific Exposition. This company was formed in 1897, the first man employed being also the man who built the machinery, as all old-time tanners were taught to do. Since that time the business has grown until there are now 300 employes on the roll, turning out approximately 1,000,000 calfskins a year. These skins are worth approximately $5,000,000, at current market prices.

Michigan Investment $15,000,000

One of the oldest tanneries in the state is that of Traugott Schmidt & Sons, also in Detroit. Traugott Schmidt was of the twelfth generation of tanners in his family. He came to America in 1849 and started a tannery in Detroit in 1852, establishing himself in his present location in Monroe avenue in 1855.

Sole leather is produced in large quantities at the tanneries of the Alpena Hide & Leather Company, at Alpena. The average capacity of this plant is about 1,000 "sides" of leather a day, a side being the half of a cow hide. This plant was built in 1892, starting operations with a very small working capacity, and has gradually developed until it has reached its present proportions, producing 7,000,000 pounds of leather annually.

The thirty-two tanneries in the state represent an investment of approximately $15,000,000 and give employment to about 5,000 persons. The products of these thirty-two plants range from boot soles to kid gloves and there are wide divergencies not only in the processes employed but also in the materials used and in the principles of their application. For many years leather was tanned or cured by the use of vegetable tanning materials, such as sumach and the bark of such trees as willow, oak, hemlock, birch, pine, and in Europe, mangrove, chestnut and other European and Asiatic trees and shrubs. The "tannin," or tannic acid, which is contained in these barks is extracted by various methods. In any case the bark is chopped and crushed, after which it is thoroughly soaked, the acid from it passing into solution with the water, forming what is known as the "liquor."

After extraction the liquor is allowed to settle in tanks, after which is is run into a decolorizing plant, which consists of a deep vat containing a coil of steam pipes and a mechanical stirring device. Here some such substance as lead acetate, alum, casein, oxalic acid or some similar agent is mixed with the liquor, precipitating the coloring matter. After standing an hour or two the clear liquor is run off gently, by means of taps fixed at different heights in the sides of the vats, and passed into the evaporating plant, where the sediment is run off separately and passed through filter presses which yield more liquor for evaporation. The evaporation is carried out in steam heated vacuum pans in order to keep the temperature low and to prevent oxidation.

Before the actual tannage can take place much has to be done which is essential to the success of the final result. If the hide or skin is fresh from the butcher, the first step is to cleanse it from dirt, blood and salt by a few hours washing in clean water. Alkaline solutions are also very generally used, but weak acids, such as formic or sulphurous, are still more efficient. This soaking process enlarges the glands in the skin and loosens the hairs, which are then removed by scraping with a knife, either by hand or in a machine.

LEATHER MANUFACTURE IN THE TANNERY OF CARL E. SCHMIDT & COMPANY, DETROIT

The machine shown in the left-hand photograph removes the hair from the skins. The spiral knives, which can be seen in the machine, revolve rapidly, applying just enough pressure to the hide to take off the hair without cutting the skin. Fine calf leathers are dyed by putting them, together with the dye, in the cylinders shown at the right, and tumbling them until the skins are thoroughly soaked.

Digitized by Google

MAKING BELTING IN THE PLANT OF THE DETROIT OAK BELTING COMPANY, DETROIT

The photograph at the left shows the shaving machines, which remove the rough flesh. At the right are shown the circular cutting knives, with gauge attachments for cutting stock to size. The leather is sorted and graded before the cutting process begins.

In nahairing it is important not merely to remove to hair but also to remove as much as possible of the hair root sheaths and fat glands, which are often deeply colored with the pigment of the hair. The hair having been removed, the skins are thrown into soft cold water, where they swell slightly. As the skins have to be free from lime before tanning, however, they have to go through a deliming process, which also reduces the swelling. This is necessary because skins tanned in a swollen state produce hard leather.

After the deliming process, they undergo the further operation of "fleshing," which is the removal of adhering portions of flesh from the inner side. This is done with the same kind of knife as is used for removing hair, except that the tools have sharper edges. So far, the treatmeat has been similar in principle, although differing slightly in detail, perhaps, for the different classes of leather, but from this point onward there is greater divergence.

Oak Bark Used Largely

All the processes so far described have for their object the removal of hair and such flesh as has adhered to the skin and the cleansing and purification of the skin for its actual conversion into leather. The problem now is to render it soft, porous, imputrescible and sufficiently resistent to water, all of which can he done in a variety of ways. The tannin-yielding materials are very numerous, but the oldest and formerly the most important in this country is the bark of the oak, usually stripped in spring when the sap has begun to rise, because at this time the bark is more readily separated from the trunk.

Oak tannin has the advantage that good leather of all descriptions, both light and heavy, can be made by its use. The tanning process which follows consists in soaking the hides in the tannin solution, which has the power of combining with the skin fibers and converting the hide into leather. If at first strong tannins were used, they would act too violently on the surface of the skin, hardening and contracting it, so that the subsequent tanning of the interior would be impeded and the outer surface would be drawn and wrinkled. This is avoided by the use at first of very weak infusions, which have already been used on goods in a more advanced stage. In the latter part of the process much stronger solutions are employed, and the hides frequently are dusted in them with ground tanning material.

In the case of sole leather, these processes may require from two to twelve months for completion, after which the leather is dried, smoothed and compressed by mechanical means. It is then ready for use. Dressing leathers, from calfskins to harness hides, receive a much shorter tanning, and the subsequent treatment is with fats and oils, which together with mechanical manipulations constitute "currying." The thin film of grease distributed over the surface of the fibers renders them supple and to some extent waterproof. The lighter fancy leathers, such as morocco, are dyed, and undergo many complex processes to fit them for their required purposes and improve their appearance.

Many skins, such as calf, glove and glace kid, are not tanned, but "tawed" by a solution of alum and salt, which is often supplemented with mixtures of flour and egg-yolk to fill and soften the leather, or according to more recent processes, by means of salts of chromium.

The first chrome tanning process was patented in Europe in 1879 by Heinzerling, although Carl E. Schmidt had not only solved the secret of chrome tanning, but was using this method in his tannery in Detroit. Chromium is a gray metal derived from iron ore, much resembling iron and containing oxides of both chrome and iron. This is converted by suitable chemical processes into chrome alums and chromates. The skins are put through a bath of this solution, which has the effect of preserving the animal substances of the skin and rendering it immune to the action of the air.

The finishing of chrome leathers is a somewhat complicated process. For box calf the skins are stretched either on a table or with a machine; partly dried, and shaved or split before dyeing. Black dyeing is done either on the table by brushing or in a vat by alternate treatment with logwood and iron solutions assisted by coal-tar dye, and colors may be produced by hot dyewood solution, although only the acid coal-tar colors will dye on chrome leather directly. The skin is now dried and glazed by friction under a smooth cylinder of glass held in the arm of a glazing machine, which presses the glass cylinder heavily on the leather as it moves away from the workman, but lifts on the return stroke. Thus is produced the fine, smooth finish which is so desirable for footwear of the finer quality.

Making Leather Belting

The manufacture and use of leather belting is a very important item, considering the place which Michigan holds in the industrial field. Probably the largest belt manufacturing plant in the state is that of the Detroit Oak Belting Company, which takes the oak-tanned hides as they come from the tannery and transforms them into the various widths and kinds of belting necessary to the operation of machinery.

The Detroit Oak Belting Company was established in 1893 on the site formerly occupied by the Croul Brothers tannery. The tannery was built in 1854 by Jerome and William Croul, and the decision to make belting from leather instead of making the leather was the result of an increasing demand for high-grade belting. The best of oak-tanned leather is used for this purpose, this leather being made in the South, where oak bark is available in large quantities. After the hides are received here, they are soaked over night to remove whatever extract they may still contain, after which they are put into a large cylinder called the "wash-wheel," where they are tumbled about and washed in water. After this operation they are scoured perfectly clean and then the water is pressed out of them. They are then dried and passed to the shaving machine, where such flesh as still clings to the hides is removed. The leather is now in a hard, dry condition. To soften the hides so that they will absorb the grease, they are dampened again and put into large boxes, where they lie over night, during which time the animal heat in the skins co-operates with the water to soften them.

Best Grades From the Center

Upon removing the skins from these boxes, they are put into large wooden cylinders called "stuffing-wheels," into which hot air is forced until the temperature is about 125 degrees, F., where they are tumbled again for approximately half an hour in hot grease. They now go to a set of five stretching machines, where each skin is held at the ends and stretched, the process being aided by a set of iron ribs which rub or knead the skins as the tension is applied. After fifteen minutes of this they go to another machine where the fibres are spread while being soaked in water, after which each skin is worked by hand to be sure that every fiber is stretched to its utmost capacity. They are now put on stretching frames and allowed to stand for two days, after which they are given a final rubbing and then hung up to dry until needed.

The first operation in the actual making of the material into belting is that of cutting the ends and sides to width. The center section of the skin is now cut out, these centers forming the best grades of belting. The centers and sides are now cut to the widths required and

Road Building Conference at University of Michigan

It has been conceded by highway builders and promoters that any ambitious program for the development of a system of highways suitable for heavy transport work, for which the motor truck is so well adapted, must be preceded by and will be dependent upon a thorough knowledge of how highways should be constructed to meet the new transport conditions. The debatable statement has been made by Prof. C. J. Tilden, a recognized engineering educator, that with all the data on hand concerning the business of building roads, there are few if any engineers who know just how to build the kind of roads now called for.

As a result of an apparent majority opinion that Prof. Tilden is correct, a movement has been started by the Government and highway interests to formulate a course of instruction in the science of road-building suitable for present and future needs, and have this course introduced into colleges and universities.

A group of engineers, highway men, educators and leaders in the automotive industry has been formed into what is known as the Permanent Committee on Highways and Highway Transport Education, with headquarters in Washington. This committee is holding conferences at the larger universities having engineering schools in an effort to gauge general opinion on the course proposed.

Such a conference was held February 23 at the University of Michigan, Ann Arbor. The sessions opened at 10 o'clock in the morning and occupied the entire day and evening. Dr. P. P. Claxton, United States Commissioner of Education, presiding, spoke on "The Highway and Social and Economic Welfare." State Highway Commissioner Frank E. Rogers welcomed the delegates for the state, and Dr. Mortimer E. Cooley, dean of the College of Engineering, welcomed them for the University. Prof. Tilden, of the department of engineering mechanics at Yale University, and director of the permanent committee, outlined the activities of that body. Roy D. Chapin, president of the Hudson Motor Car Company and vice-president of the National Automobile Chamber of Commerce, discussed the economics of highway transport. Highway and highway transport education in secondary schools was treated by George C. Diehl, chairman of the good roads board of the American Automobile Association. Harriet E. Beard, supervisor of safety education in the Detroit public schools, discussed safety education.

The afternoon program was opened with an address by Thomas H. MacDonald, chief of the United States Bureau of Public Roads, on "The Measure of Highway Accomplishment." Col. Mason M. Patrick, United States Engineers, followed with "The Army's Highway Transport Problem." The inter-relationship of waterway, railway and highway transport was the subject of an address by Henry E. Riggs, professor of civil engineering, University of Michigan. Charles J. Bennett, highway commissioner in Connecticut, discussed the problem of snow removal from transport routes. The subject of "Economic Value of Highway Transport Surveys," was assigned to Dr. Arthur H. Blanchard, professor of highway engineering and highway transport at the University.

An informal dinner preceded the evening session, at which Dr. Marion Leroy Burton, president of the University, spoke. William C. Redfield, former Secretary of Commerce, spoke on "The Trinity of Transportation." Tom Snyder, secretary of the Indiana Highway Transport and Terminal Association, pointed out the relation between highway transport and industry, and its relationship to the back-to-the-farm movement was outlined by A. R. Kroh, of the development department of the Goodyear Tire & Rubber Company.

Survival of the Fittest

This law is just as immutable in Business as it is in Nature, and just as desirable. All progress is based upon it. In such times as the present it is *the one great Law.*

Fitness is a matter of method and management. The well organized, well managed enterprise plans its work and works its plan, gaining strength as it marches forward on broader missions to larger profits. The loosely knit, inefficient and unmethodical, falter and fail.

That business enterprises may be fit,

That waste may be eliminated and competent organization built up,

That the executive may have at all times the comprehensive and dependable facts and figures which are the only premises of correct conclusions, the only basis of intelligent, progressive action—

Ernst and Ernst offer the services of tried and experienced staffs of business engineers and expert accountants in the individual application of

Selling the Automotive Industry To America as a Transportation Utility

Representative Supreme Co-ordinate Council Needed To Speak and Act With Authority for the Business

By EZRA W. CLARK

Advertising Manager, Clark Equipment Company, Buchanan

Extracts from an address delivered before the recent meeting of the Advertising Managers' Council of the Motor & Accessory Manufacturers' Association, at the Hotel Astor, New York.

I HAVE BEEN ASKED to suggest how we should sell the automotive industry to America, and I suggest as one of the first steps in this plan that we should first thoroughly understand that we are worthily building something worthy, intended for a worthy purpose. Then and then only will our feet be planted on firm ground, and then and then only will we be able to stand the shocks of adversity as well as to go forward aggressively to greater triumphs of prosperity.

Conditions in the automotive industry are not what they should be. We are passing through a period of readjustment that was inevitable and the hardships and trials of this period will undoubtedly be of far-reaching and lasting benefit to the industry. Often in a family or in a community it is necessary to make an example of a spendthrift in order to teach a wholesome lesson to all other members of the community, but no one likes to be singled out and pilloried as the horrible example. Yet that was just what happened last year to the automotive industry.

Selling on a Sound Utility Basis

Credit is the life blood of the industry and when the powers that be discovered last spring that the blood pressure of industry was alarmingly high, they took drastic means to remedy the condition and an embargo was placed on automotive credits. Why? Because the men controlling credit conditions—the Federal Reserve Board, the banks and financial interests—had not been sold on the essential character of the automotive industry, but had been given a false impression of its merits by misleading, misdirected and misworded advertising which for a long time had formed the basis of its sales propaganda.

Automobiles have been sold to America for years on appeals to pride, on appeals to woman's vanity and on points of luxury such as the luxuriant cushioning effect of springs, the comfortable ease of soft cushions, the mirror-like reflections of fourteen coats of varnish, and a multitude of intimate personal refinements. Sales also had been made because high grade cars had been associated with scenes of rowing, fishing and swimming, and clever men had linked the name of a particular car with ideas of pleasure. The cars of America have been sold on the basis of vanity and recreation rather than on the basis of utility or necessity.

Yet we have the word of Charles Clifton, president of the National Automobile Chamber of Commerce, that 90 per cent of all passenger cars are used for business. He states further that "the average increase in business productivity due to motor cars was 56.7 per cent. Translated into working capacity, this means that 6,800,000 cars in daily use in America add every day the equivalent of an average over 3,800,000 workers to the nation's productive forces."

Little effort has been made to sell passenger miles or freight ton miles, the very basis upon which all other transportation is sold. Thus, when an alarming condition demanded drastic treatment, those in authority cut away the foundations of automotive credits without the slightest thought that they were in any sense crippling one of the great transportation systems of our country.

It was not long before the drastic result of this step made itself evident and a line of demarcation was laid down between passenger car and truck as a basis of credit, but the momentum of the first action was so great that its influence had to run its course and could be checked but feebly.

Mark you that the Federal Reserve Board recognized at that time that an industrial crisis was being reached in America because of insufficient transportation facilities, and yet in view of that knowledge by the Federal Reserve Board they restricted automotive credits. Why? Because they had not been brought to realize that the automotive industry was building units of transportation.

It is high time that the men of our industry realized that we individually have been building the units to make up a new system of modern transportation which daily moves millions of passengers millions of miles, and millions of tons of freight millions of miles.

You ask me to sell the automotive industry to America, and having brought to you a realization that we are building units of passenger and freight transportation, I lay upon the hearts of the men whose privilege and duty it is to write the sales messages of this industry a sense of responsibility for the enunciation of our individual campaigns so that they shall carry ideas of utility and essentiality.

Banish the Speed Vamps

We are engaged in the building of a virile, masculine industry. Our campaigns should be not effeminate. The real true blooded women of our land will be attracted to those cars which speak most of strength and sturdiness, of endurance and accomplishment, rather than to those whose appeals are directed to the frailties and weaknesses of vanity and pride. Thank God, the women of our land think more of strength and achievement than they do of "lounge lizards" and "speed vamps." We should emphasize passenger and truck performance in terms of passenger miles and freight ton miles so as to leave in the minds of the nation wholesome impression of performance and utility. To our printed word should be added similar propaganda by word of mouth carried by factory representatives and disseminate through dealer organizations.

This much we can do as individuals and a individual companies. This much we owe t the stability of our own organizations and th insurance of their permanency and success. Bo just so certain as we neglect this, we will suffe in time of adversity out of proportion to ou just deserts.

"What can we do as an industry to sell our selves to the country?" In other words, w want to have the automotive industry recog nized and honored as a worthy member of the association of industries on which is based the prosperity and progress of our nation.

An industry, in the same as an individual or a corporation, to be deemed worthy of prestige and good will, must perform worthy works commensurate with its ability and opportunity —work devoid of seifishness, of such intent and scope that out of it will come greater national prosperity, of which it will receive its proper, proportionate share.

Must Have Organization

Performance must be preceded by organization. The automotive industry is not fully organized. It has many excellent associations and organizations—but each formed and fashioned to meet some particular purpose. There is none created with the idea of performing a meritorious duty owed by the industry to the nation.

Let us scan our present organizations. We have the National Automobile Chamber of Commerce; the Motor and Accessory Manufacturers' Association; the Motor Truck Manufacturers' Association; the Motor Truck Sales Managers' Association; the National Automobile Dealers' Association; the Society of Automotive Engineers; the Automotive Equipment Association; the American Automobile Association; the Motor Truck Association of America and other organizations of similar character.

Each of these has been formed because of a realization of the necessity of an organization to care for the interests of certain groups within the industry. They function harmoniously but independently. The French, English, Belgian and American armies were marvels of individual efficiency and won numerous battles, but not until they had been united and co-ordinated under the Supreme Military Council did they begin to win campaigns.

The automotive industry needs a representative co-ordinate council to which shall be delegated certain work and duties. The voice of the automotive industry should become articulate when its rights are imperilled. Tax the industry justly. We are building passenger and freight transportation vehicles. If transportation is asked to supply a part of the national revenues let the tax fall on every new freight car and motor truck and in equitable proportion to its carrying capacity; let the tax fall on every locomotive, passenger coach, Pullman sleeper as well as passenger automobile—and in just proportion to its power or capacity.

Why tax a replacement part on car or truck and not tax a brake, spring or defective wheel on a locomotive or freight car? If we tax a gas tax steam—one is as important as the other.

We must have a body before we can have a

The Growing Tax Bill

ACCORDING to the Michigan State Tax Commission, taxpayers in this state paid $30,000,000 more into state, county and city treasuries in 1920 than in 1919. The average rate per $1,000 has increased from $24.60 to $26.40, while the assessed valuation has jumped from $4,503,980,981 for 1919 to $5,319,702,886. The total tax levy for 1919 was $110,776,106.19, while for 1920 it has been placed at $140,438,982.94. The largest increase was made in taxes for educational purposes, which were advanced from $29,753,423.09 in 1919 to $44,746,118.20 for 1920.

voice. The supreme co-ordinate council of the automotive industry should have at its head a big man—broad-gauged, dynamic, dominant, paid an amount sufficient to command his fullest interest and commensurate with that paid to railroad life insurance or bank presidents—we need a big man for a big job.

This council should be composed of representatives from each of the dominant associations of the industry. It should have at its disposal ample resources: not less than $1,000,000 a year. How would you raise it? By a sales assessment or by a levy of 1 per cent on all advertising appropriations within the industry. By subscription if necessary.

This council should advertise. Through the Associated Advertising Agencies it should formulate and execute a comprehensive campaign that would multiply many fold the efficiency of every individual campaign in the industry. It would have at its disposal the best advertising brains of the land and should be able to dramatize on new lines "the spirit of transportation."

Through this supreme council the spirit of the industry should function for the good of our nation. Who shall say what volume of wealth the development of the government aided transcontinental railroads gave to America. Vast empires of the central Mississippi Valley, the West, Northwest, Southwest and Pacific were brought within reach of the markets of the nation and world by railroad construction and development. Yet I say to you that still vaster empires and sources of agricultural wealth lie tributary to these great steel arteries of travel waiting for the motor car and motor truck to open them to development.

The Farm Development Tour of 1919 showed the possibilities for work in this direction. The supreme council could organize not one but a dozen such tours and could establish with the co-operation of tractor manufacturers, builders of powered agricultural implements and country agents model farms in widely scattered, remote rural communities; model farms to which public school and agricultural college students and practical farmers could be brought for demonstration work and instruction.

Opportunity and ability to do a good work constitute duty. The allied automotive industry of America working under the direction of a generalissimo at the head of a supreme co-ordinate council has the opportunity and ability to more than double our agricultural resources by bringing our available areable land closer to centers of supplies and markets of distribution.

Let us add but a bushel of corn, wheat and oats to every acre of corn, wheat and oats and 10 pounds of cotton to every acre of cotton, and we will add $238,342,000 to the national wealth annually or enough to buy 238,000 additional cars at $1,000 each or 119,171 additional motor trucks at $2,000 each.

Let us start here and now an impetus that shall call into being this supreme co-ordinate council of the automotive industry. When the ship falls into the doldrums it is time to get out the oars or connect up the auxiliary motor. Not rest but work is what our industry most needs. Let's go forward!

How Motor Trucks Add To Value of Farm Lands

Motor trucks and highway development are the economic factors which are responsible for as much as 100 per cent annual increase in land value in various sections of the country, according to a report by the Firestone Ship by Truck Bureau, Akron.

Officials of one southern community—Hinds county, Mississippi—in campaigning for a $1,000,000 highway bond issue, claim that motor trucks, operating on good roads, have raised land values from $25 an acre five years ago to $100 and $125 an acre at present valuation. County supervisors, submitting the issue to a vote of the people, attribute their decision to ask for this sum "to the great agricultural, commercial and educational development of the country due to the use of the motor truck, tractors and passenger cars."

Investigation has developed, according to the Bureau report, that the farther away from town on improved roads that real estate lies, the greater the percentage of increase in value with the advent of good roads. Within five miles of an eastern city where recent improvements in highways were made, the appreciation in value within five years was only 68.3. But ten miles out the percentage of increase was 96.7 and twenty-five miles away the ratio of increase was 194.9. It is held that the motor truck is equally responsible with the highways for this improvement.

Farms contiguous to fairly good roads have been known to advance in value within two or three years after the construction of hard surface highways as much as 114 per cent, while the lowest increase reported was found to be 9.1 percentage.

"With these figures as a basis for estimation," says Ernest Farr, chief of the Bureau, "it does not require a stretch of the imagination to understand that the increase in land values is in direct ratio to two prime factors. There are a number of miles of improved highway built and the number of motor trucks added to those already carrying the burden of produce and merchandise from the farm to the city and the city to the farm."

TO BUY TRADE FINANCING STOCK

State Senator W. H. Chatfield, of Cincinnati, has prepared a bill to be introduced in the Ohio legislature to allow state banks to subscribe for stock in the Foreign Trade Financing Corporation. The bill will be modeled after the Edge act, which authorizes national banks to invest not to exceed 10 per cent of their capital and surplus in this $100,000,000 corporation.

Signs of Industrial Revival

Several Automotive and Other Factories Throughout Michigan Are Taking On Men

FURTHER EVIDENCE that the automotive manufacturing situation in Michigan continues to improve is seen in plant reopenings during the last week or in announcements of definite dates on which operations will be resumed.

The C. R. Wilson Body Company, Detroit, took on about 200 men Monday. This force, it is hoped, will be increased within a short time. The company, which is making bodies for the Reo, Sheridan and Paige concerns, employed 2,500 men during peak production last year.

"Things are beginning to break," said C. Haines Wilson. "Old customers are coming in in increasing frequency and new customers are appearing."

Within the last 10 days the Ford Motor Company has added about 2,000 men at the Highland Park plant and 300 at the tractor factory at River Rouge. The normal number employed at the latter plant is between 5,000 and 6,000 men. Reports from Iron Mountain, where Henry Ford is building a mill, are that operations are being resumed after a slump of several weeks.

Announcement has been made by the Federal Motor Truck Company, Detroit, that it will resume operations on March 1 with a production schedule of 200 vehicles a month, as against a normal output of 450.

Harry M. Jewett, president of the Paige-Detroit Motor Car Company, predicted this week that the company would actually be behind orders before the end of the month.

"We have scheduled a production of 850 passenger cars for February," he said, "and we hope to meet that schedule, but even at that we will be lagging a little behind our orders."

The Liberty Motor Car Company, Detroit, reports that reports from its district supervisors from the Western as well as Eastern states indicate marked improvement in automobile sales conditions and an approach toward normalcy in some parts of the country. At the recent automobile show in Minneapolis, Minn., eleven cars were sold at retail by the local Liberty dealer, which is considered good business inasmuch as it was believed that probably no part of the country had felt more keenly the falling off of automobile sales than the Northwest states.

The company also reports an increase in the sales of enclosed cars and that this has led to the production of 52 per cent of Liberty closed cars out of the total output.

Announcement was made this week that the St. Johns plant of the Hayes Wheel Company would reopen on March 1 with a full force after having been idle since December. The factory makes motor truck wheels.

The Delta Chemical Company, Gladstone, which has been closed the last two months is expected to reopen with nearly a full force of 250 men March 1. About 40 men have been employed for some time in the repair shop and in getting the plant in condition for a resumption of operations.

The Akron factory of the International Harvester Company, where the International motor trucks are made, has increased its output to 150 vehicles a week. The company is working on an order for 500 trucks for shipment overseas.

The car loading department of the Furniture Manufacturers' Association of Grand Rapids in January shipped 90 cars. Goods rapidly are coming through the local factories now and shipments in February will show a large increase over the first month of the year. At the January sale, buyers were conservative with their orders, taking little more than what their immediate needs required. Almost invariably the instructions were for immediate shipment. The factories are getting the goods off as rapidly as possible.

Informal discussion of business prospects featured the quarterly meeting of the Kalamazoo Manufacturers' Association, held at the Chamber of Commerce, last week. While the expressions generally were conservative, they assumed a trend indicating improvement in the outlook. W. E. Kidder, of the Kalamazoo Sled Company, and Louis Rosenbaum, of the Kalamazoo Pant Company, tendered their resignations from the board of directors prior to the general meeting, and the board elected W. T. Clark, of the Fuller & Sons Manufacturing Company, and George Hopkins, of the Barley Motor Car Company, as their successors.

KALAMAZOO ENGINEERS ORGANIZE

The Kalamazoo Engineering Society, reorganized and affiliated with the American Association of Engineers, has elected these officers: L. J. Wykkel, president; Ernest Batterson, vice-president; D. E. Peet, secretary; L. A. Cobb, treasurer.

WEEK'S COAL PRODUCTION

Production of bituminous coal during the week ended February 5 totaled approximately 8,045,000 tons, which is 521,000 tons less than for the previous week and more than 1,160,000 tons below the output of the week of January 22. The output of anthracite during the same three weeks was respectively 1,985,000, 1,999,000 and 1,919,000 tons the first in February thus being about on a par with the last week of January and more than 250,000 tons ahead of the third week of that month.

REORGANIZING ACME CHAIR CO.

Business men of Reading have been called upon to help in the reorganization of the Acme Chair Company, whose plant and most of its personal property was destroyed by fire last December. The firm is an old-established one having been organized in 1872, and has always been one of the main industrial enterprises in the community. It is proposed to increase the capital stock from $125,000 to $250,000, by being common and the other half preferred stock, the latter to bear 7 per cent interest.

PLUMBERS CUT OWN WAGES

Jackson plumbers have voted to cut their wages 10 cents an hour, or from $1 to 90 cents, and propose to ask other building trades to follow suit. The action was voluntary.

BATTERY INTERESTS MERGED

The Excel Battery Company, Jackson, has taken over the interests of the Battery Service Company. The new company is composed of C. W. Cotton, president; Harold Cotton, vice-president, and George L. Cotton, secretary and treasurer. The latter formerly owned the Battery Service Company.

General Motors Profits In 1919 Total $48,252,000

During 1920 the General Motors Corporation's sales amounted to $565,000,000, an increase of $56,000,000 over 1919. The net profits were approximately $48,252,000. Total assets are $602,753,000, with real estate, plants and equipment at $248,000,000. Good will, patents, copyrights, etc., are listed as $22,724,000.

Total liabilities are $126,827,000 and total reserves $43,374,970. Total capital stock is $303,231,850 and surplus $127,531,180.

Pierre S. du Pont, president, in his report, says:

"The officers of the corporation have clearly in mind the importance of maintaining a strong cash position and of reducing the corporation's inventories and current indebtedness. During the year the corporation paid as federal income and excess profits taxes approximately $26,000,000. It also retired $12,000,000 of notes issued in connection with the purchase of the Fisher Body Corporation stock in 1919 and expended approximately $86,000,000 in extending and improving plants and facilities in line with the construction programs laid out in 1918 and succeeding years.

"While all known losses and appropriate write-down of inventories have been taken care of, nevertheless the board of directors, at its next meeting, will be requested to consider the advisability of appropriating some part, not exceeding $15,000,000, of the surplus account as a reserve for future contingencies.

MICHIGAN MOTOR GARMENT

The Michigan Motor Garment Company, Greenville, at its annual meeting elected the following officers: F. E. Ranney, president; George C. Bower, vice-president; R. M. Beardslee, secretary-treasurer and manager; O. W. Fowler, assistant secretary. The board of directors consists of the Messrs. Ranney, Beardslee, Bower, E. W. Ranney, J. H. Ditzeman, J. S. Hibson and E. A. Kemp. Three more branches will be opened.

TWO NEW ALMA PRODUCTS

The Alma Foundry & Manufacturing Company, Alma, has announced that it will manufacture the Little Giant Hay Presses, which formerly were made in Alma and later by a concern in St. Louis. The company is also getting ready to bring out a new furnace, to be known as the Alma. As announced in a previous issue, the concern, which is a new one, occupies the plant formerly the home of the X-Cel-All-Paint Company.

ANDRIX LOCK-NUT ELECTION

Stockholders of the Andrix Lock-Nut Company, Adrian, have elected the following officers and directors: H. Andrix, president; George D. Harris, Jr., vice-president; George D. Harris, Sr., secretary-treasurer. These officers and W. A. Lowe, C. W. Obee, Theodore Glazer and S. A. Foster make up the board of directors.

ADVANCE PUMP CO. DIRECTORS

The following directors have been elected by the Advance Pump & Compressor Company, Battle Creek: A. E. Blanck, L. B. Anderson, I. N. Moore, Eugene Stewart, P. D. Ferguson, C. A. Flinn and C. B. Halladay.

HODGES BUYS CHAIN RIGHTS

Announcement has been made by C. W. Hodges, Galesburg, Mich., that he has bought the rights, title and interest of Henry Lane in the Kalamazoo Chain Company, which gives him full ownership of all the real estate, patents and chain business located in Galesburg. The name of the concern will be changed to that of the Hodges Chain Company, and a complete line of tire chains and chains for other purposes will be brought out.

UNITED STATES SHIPPING BOARD EMERGENCY FLEET CORPORATION, WASHINGTON, D. C.

Today's World Trade Problems

Theme of Eighth National Foreign Trade Convention, To Be Held in Cleveland, May 4, 5, 6 and 7, Announced

AMERICAN Foreign Trade and Its Present Problems" will be the theme of the Eighth National Foreign Trade Convention of the National Foreign Trade Council, to be held in Cleveland, May 4, 5, 6 and 7. The call for the convention, which has just been issued, says in part:

"The foreign trade of the United States, in common with domestic business, is suffering from contraction of credit, or credits, and other contributory causes. To study the causes of this check upon our international commercial activities; to analyze the conditions now confronting our overseas trade, and those it will have to meet in the future, and to endeavor to secure the thoughtful judgment of American business men upon the best methods of solving these problems of vital importance to all the American people," the convention has been called.

"In order that the convention may be equipped with the ability and the experience necessary to consider these problems, and that its judgment may have the value attaching to the well considered opinion of American business," the call continues, "Americans engaged in or desirous of entering foreign trade and connected with any factor of our international commerce, agricultural, commercial, industrial, financial or transportation; all chambers of commerce, boards of trade, national and state associations and other commercial and industrial organizations, as well as firms and individuals, are cordially invited to participate individually or by the appointment of delegates."

The call is signed by James A. Farrell, chairman, and O. K. Davis, secretary, of the National Foreign Trade Council.

The convention will open at 8 p. m., May 3, with a conference of trade advisers, this to be followed by a reception at 9 p. m., given by the members of the Council for foreign and convention delegates.

The first general session will be held at 10 a. m., the following day, the topics to be considered being "American Trade and Its Influence on Foreign Exchange" and "The Causes of Inflation and Its Effect on the Exchanges." At the second general session, at 2:30 p. m., the topics are: "Influence of American Investment Abroad," "The Settlement of Our Export Balance" and "Frozen Credits—What They Are and How to Thaw Them." Group sessions will be held at 8 p. m., the subject to be considered by Group 1 being, "Commercial Education for Foreign Trade;" by Group 2, "Foreign Credits" in co-operation with the National Association of Credit Men," and by Group 3, "Problems of the Export Manager" in co-operation with the Export Managers' Club.

The third general session, at 10 a. m., Thursday, May 5, will take up these topics: "The Effect of Double Taxation on Foreign Trade," "Foreign News and Foreign Trade," "Discrimination Against Foreign Trade," "A Reasonable American Policy for Foreign Loans" and "Adequate Foreign Service Essential to Our Foreign Trade." Group sessions will be held in the afternoon, Group 4 taking up special export problems of the manufacturer, in co-operation with the American Manufacturers' Export Association; Group 5, foreign trade advertising; Group 6, inter-American trade relations, and Group 7, the interest of agriculture in foreign trade, in co-operation with the American Farm Bureau Federation.

At the fourth general session, at 10 a. m. Friday, American maritime policy, marine insurance, inland transportation for foreign trade, and return cargoes will be considered. In the afternoon Groups 8, 9 and 10 will have their meetings, the first discussing banking service to foreign trade, in co-operation with the American Bankers' Association; the second, merchandising and forwarding, in co-operation with the American Exporters and Importers' Association, and the third, trade relations with the Far East.

The fifth and final general session will be held Saturday morning at 10. At this meeting the reports of the group sessions will be received and the final declaration of the convention formulated.

A registration fee of $10 is required from each delegate, and none but registered delegates will be permitted to participate in the convention. The proceeds of registration will be used to defray, in part, the expenses of the convention and to print the official proceedings, a bound volume of which will be sent to each delegate. Payment may be made at the time of personal registration at the Hollenden Hotel, or by check in advance to the National Foreign Trade Council, 1 Hanover Square, New York.

The annual banquet will be held the evening of Friday, May 5. Dress will be formal.

The names of the convention speakers have not been made public.

Copper Country Sees Situation Improving

The outlook in the Michigan copper district is beginning to brighten a little, according to reports from Houghton. Last week a shipment of 500,000 pounds was made to the Detroit Copper & Brass Rolling Mills and loading was started on a consignment of 560,000 pounds to Germany. This refers to activities at the Copper Range mines, Baltic, Champion and Trimountain. So far as is known, the Calumet & Hecla has not as yet received any new business from Germany. Some of the other mines in the district are practically idle.

The Copper Range, according to the Houghton Mining Gazette, is taking on men, especially at its Champion mine. Normally there are 1,200 men at the mine. Baltic and Trimountain now have from 40 to 50 per cent of their 1915-1916 force. Production at the three Champion shafts has been increased and is now 1,400 to 1,600 of selected rock, as compared with 1,000 two months ago. At the Baltic 16,000 tons of rock a month is now coming out, or 3,000 tons more than 60 or 90 days ago. The output at the Trimountain is 8,000 tons a month, also a substantial increase over two months ago.

MAYES BROS. TOOL ELECTION

At the annual meeting of the Mayes Brothers Tool Manufacturing Company, Port Austin, the following officers were elected: Frank Kinch, president; George S. Farrer, vice-president; H. S. Finan, secretary-treasurer. The directors are Lawrence Yaroch, Sr., S. J. Wallace, Frank Kinch and M. H. Mayes.

McLOUTH SHIPYARD BUSY

The McLouth shipyard, in Marine City, is reported to have a number of important jobs which are keeping the works busy and probably will keep it at capacity for some time to come. Most of the work is repairing and rebuilding of lake craft.

EDWIN DENBY

Something About the New Secretary of the Navy

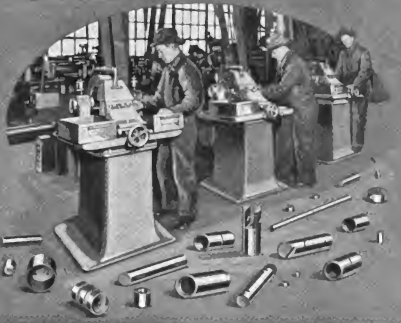
EDWIN DENBY

Edwin Denby, who, it was reported early this week, had been selected by President-elect Harding to be Secretary of the Navy, is one of Detroit's most distinguished citizens—lawyer, manufacturer, banker, former congressman and a leader in civic affairs.

Born at Evansville, Ind., he went with his father and mother to China when a young man, the elder Denby having been appointed United States minister to that country. While in China Mr. Denby entered the employ of the Chinese Imperial Maritime Customs Service, where he remained seven years. He returned to Detroit in 1894 and matriculated at the University of Michigan, being graduated in 1896. Thereafter he went into the practice of law in the offices of Keena & Lightner, later participating in the organization of the firm of May, Denby & Webster. Afterward he headed the law firm of Denby, Kennedy & O'Brien. When the Spanish-American war broke out he, being a member of the Naval Reserves, was assigned to duty as a third-class gunner's mate on the gunboat Yosemite, and saw considerable fighting.

After the war he resumed the practice of law in Detroit and in 1902 was elected to the Legislature. In 1904 he was sent to Congress to represent the old First district, which at that time embraced most of Detroit. He was twice re-elected.

When he re-entered private life he resumed the practice of law and became interested as well in business and finance in Detroit. He became vice-president of the Denby Motor Truck Company, was one of the original stockholders of the Hupp Motor Car Corporation and was elected a director of the National Bank of Commerce. When the Bankers Trust Company was organized he was made a vice-president.



When America entered the World War Mr. Denby, to set an example for the young men, enlisted, after considerable difficulty because of his age, as a private in the Marine Corps, being advanced later first to corporal, then sergeant, then second and first lieutenant, captain and major. He saw service both at home and in France. Last year he was a candidate for Governor on the Republican ticket, but withdrew before the primaries. Lately he has been chief probation officer of the Municipal Courts.

MOTOR CAR DEALERS ORGANIZING

Guy O. Simons, president of the Simons Sales Company, Willys-Overland distributors in Detroit, as regional director vice-president of the National Automobile Dealers' Association has been addressing meetings of dealers in Lansing, Jackson, Bay City, Saginaw and Flint preparatory to the organization of the Michigan Automobile Dealers' Association.

GMC CHANGES BUILDING NAME

What is now known as the Durant building, the office structure of the General Motors Corporation, Grand Boulevard, Detroit, hereafter will be officially known as the General Motors building and will be the general headquarters for the corporation. The Chevrolet building, 224 West Fifty-seventh street, New York, also has been changed to the General Motors building, New York branch.

FIRST ROLLS-ROYCES COMPLETED

The first of the American-made Rolls-Royce sixes have been completed at the plant of Rolls-Royce of America, Inc., in Springfield, Mass. It is said that the company has orders for at least 75 of its chassis at this time, or $862,000 of business. The chassis sells at $11,500, which is said to be the highest price in the American market. According to the Wall Street Journal, profit on each chassis, after charges, is around $2,000. It is expected that capacity production will be about one chassis a day, or 300 for the year. All bodies are custom built.

MULTOMETER CORP. REORGANIZED

The Multometer Corporation, Philadelphia, in which several Michigan men are interested financially, has been reorganized, with Arthur Brook, Jr., Philadelphia, as president; Robert W. Blair, of Blair & Rothfus, Detroit, vice-president; Thomas J. Buckley, Philadelphia, secretary-treasurer, and E. E. Carroll, assistant secretary and treasurer. The board of directors includes Frederick R. Johnson, secretary of the Packard Motor Car Company, Detroit. The corporation has a capital stock of $2,500,000 and makes a variety of accessories such as speedometers, multometers, lubrication indicators, tire valves, truck meters, clocks, etc. It is expected that the plant will be in full production by June.

NAPOLEON MOTORS ELECTION

Election of officers of the Napoleon Motors Company, Traverse City, resulted as follows: President, W. J. Chase, vice-president, Frank Trude; secretary-treasurer, W. G. Rath; general manager, C. D. Peet. Directors: the officers and E. G. Arntz, L. W. Smith and Frank Brooker. The company has declared a stock dividend of 8 per cent and an additional 2 per cent, payable in script redeemable in cash August 1, 1921.

U. S. CARS AT SCOTTISH SHOW

American automobiles, next to British-made cars, predominated at the annual Scottish automobile show, held in Glasgow. The following cars were shown: Hupmobile, Buick, Dort, Chalmers, Packard, Jordan, Milburn Electric, Chevrolet, Mitchell, Maxwell, Oakland, Overland, Oldsmobile, Paige, Dodge, Essex, Hudson and Cadillac.

REGISTRATION BOOKS READY

Books giving the motor vehicle registrations in Michigan have just been issued from the press, and will be sent by the state to each county clerk and chief of police in cities of more than 10,000 population. The book will be sold to residents of the state for $25 and to non-residents for $50. The cost of the publication is about $20,000, but the charges to private individuals are expected to help defray this expense. While the licenses this year were issued from 68 offices, the numbers are given in numerical order, and by the use of an index there will be little difficulty in finding any particular number, which was not true last year.

PAGE JOINS O'CONNELL TRUCK

Robert E. Page, formerly field agent of the Nelson Motor Truck Company, Saginaw, is now general sales manager of the O'Connell Motor Truck Company, Waukegan, Ill.

DURANT'S NEW SALES PLAN

When the new Durant car, to sell for less than $1,000, is ready for the market, it is said that Mr. Durant will seek representatives from among salesmen who have made records in other lines, but will not give an agency to any company or person who has sold cars of other makes. The first car is now nearing completion in a plant on Long Island and production will be started in August in a factory in Flint, according to report.

MORE PLANTS BACK AT WORK

Fisher Body Corporation plants on West End avenue, at Forest avenue east and Grandy avenue and at 722 Forest avenue east, Detroit, have resumed operations. The American Motor Body Company, formerly the Wadsworth Manufacturing Company, Detroit, has put between 500 and 600 men at work building sedan bodies for the Ford Motor Company. The Muskegon Motor Specialties Company, Muskegon, is running with one-third the regular force, six days a week.

ROWLEY WITH NASH MOTORS

W. O. Rowley, formerly sales manager with the Siegel-Zeckendorf Company, is now with the Detroit branch of Nash Motors.

PREDICTS 1921 TIRE DEMAND

The 1921 tire demand, according to John J. Watson, Jr., president of the Lee Tire & Rubber Company, New York, will approximate 30,000,000. He bases this estimate on a probable car production of 1,000,000 and a scrapping of from 500,000 to 750,000 old cars.

ELECTRIC AUTO-LITE ADDS WORKERS

A gradual increase in business has prompted the Electric Auto-Lite Corporation, Toledo, subsidiary of the Willys Corporation, to call back to work 200 employes, making the force at work now 350, as compared with a normal payroll of 3,000.

BOLLSTROM MOTORS CHANGE

The Bollstrom Motors, Inc., St. Louis, Mich., has withdrawn its connection with the Bollstrom Engineering Company and henceforth will be a separate company. F. C. Ohland, secretary and treasurer, has resigned.

BUICK'S JANUARY SALES

It is reported from the plant offices of the Buick Motor Company, Flint, that the company sold 1,700 cars in January.

HYATT INCREASES FORCE

The Hyatt Roller Bearing Company plant at Paterson, N. J., is gradually increasing its working force as orders for product are received.

Digitized by Google

FLINT'S 1921 SHOW MARCH 2-5

The Flint Automobile Dealers' Association announces that the annual Flint motor show will be held in the Buick building, March 2 to 5. The association, which includes most all of the local automobile distributors and dealers, is making efforts to have the biggest and best display of cars ever shown in the city. While the decorative effect of the show room will be most attractive, the endeavor will be directed toward making the visitor more interested in the automobiles than in the decorations. It is a well-known fact that in connection with many shows held in recent years throughout the country, a large percentage of the visitors came more especially to look at the decorations than at the cars.

OAKLAND SALES HEADS CONFER

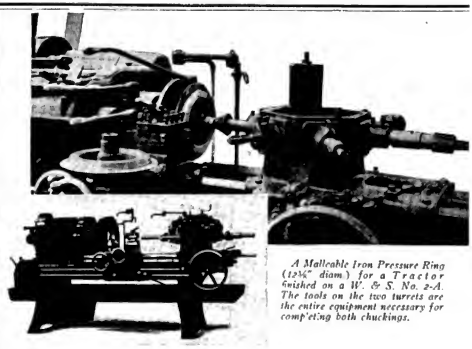
Headquarters and field sales executives of the Oakland Motor Car Company held a three-day conference at the factory in Pontiac this week.

WILLS SHIPPING CARS

C. H. Wills & Company, Marysville automobile manufacturers, have begun making shipments of their cars, the Wills-Ste. Claire. The first consignment, which left the factory Saturday, February 19, went to New York and Chicago, and the second consignment to Philadelphia and Boston. Robert S. Potter, vice-president of the National Shawmut Bank, Boston, was the first purchaser. The first car was completed February 12. Mr. Wills drove it 65 miles an hour on a final test run.

BENTON HARBOR CASTINGS CO.

The annual meeting of the Benton Harbor Castings Company, Benton Harbor, resulted in the election of F. L. Bradford as president, E. C. Bowlby, vice-president; H. S. Gray, secretary, and J. B. Kovar, treasurer. The directors include the officers and W. F. Benning, S. W. Trick, W. S. Robinson, L. N. Allen and H. A. Furber. It is announced that James A. Wolf has purchased a substantial amount of stock in the company and has become superintendent.



PARIS TRAVEL BUREAU OPENED

The Equitable Trust Company, New York, has opened a travel service bureau in Paris, France, under the direction of an expert. Travelers from the United States will be enabled to obtain suggestions as to the most desirable hotels, rates and accommodations and purchase of railway and steamship tickets, besides foreign trade information, market news status of commodity markets and any other information necessary to the American business man or traveler abroad.

STATE BANK AT WEST BRANCH

The Ogemaw County Bank, West Branch, a private institution since 1899, has incorporated as a state bank and plans to open as a state institution about April 15. J. McNay Ealy will be president and R. C. McKay, cashier. Directors, in addition to these officers, will be Peter Pardee, of Reese; John McKay and W. T. Yeo, West Branch.

At the annual meeting of the Truscon Steel Company, held in Detroit, Monday, February 21, it was voted to increase the capital of the company $2,000,000. The probabilities are that the increase will be effected by the means of a stock dividend, although such action was left to the board of determination. While the annual statement is not yet for distribution, the surplus is estimated to be about $3,000,000, which would seem to presage the stock dividend as a probable outcome. Capital-bones as per the last statement at hand were $2,500,000 7 per cent preferred and $2,000,000 common. The secretary's report speaks of very profitable business during the first 10 months of 1920 with very good prospects when conditions become normal.

TRANSPORTATION NEWS

Rail :: Commercial Hauling :: Water

Washington—Violations of rulings made by the Interstate Commerce Commission relative to the shipment of coal into Detroit, which are costing Michigan manufacturers $1,120,000 a year, are charged in a bill of complaint against 63 railroads filed by the Michigan Manufacturers' Association with the I. C. C. It is alleged that roads bringing coal from the Hocking Valley, Inner Crescent and Outer Crescent districts are obtaining 16 cents more a ton on shipments than allowed by the Commission and that the basic shipping point has been moved to West Virginia, even for coal coming from Ohio. A few years ago the Commission established a 40-cent differential between Ohio and Eastern coal shipments, but when the 40 per cent increase in rates became effective the base for coal moving north into Detroit was changed to West Virginia, it is charged.

Saginaw—J. H. Shenck has informed the Board of Commerce that a new freight line will be established between the city, Detroit, Bay City and Harbor Beach.

Detroit—State Highway Commissioner Frank F. Rogers has made plans for a paved highway across Michigan, from Detroit to Benton Harbor, as part of a 300-mile stretch to Chicago. Work is to be started this spring on a 25-mile gap between Detroit and Jackson. Asphalt and concrete surfacing will be used. The road will be built with federal aid and will cost about $20,000 a mile.

Grand Rapids—The Pennsylvania Railroad Company's Michigan division, which reduced its working force in the maintenance of equipment department in January, resumed this work in this division Monday. The notice states that 80 per cent of the men will be re-employed.

Washington—As a result of an agreement between state officials of Michigan and Wisconsin, reached at a conference in this city, Michigan's protest against an increase in intrastate passenger rates to 3.6 cents a mile, in conformity with interstate rates, will be included with that of Wisconsin, which is being heard by the United States Supreme Court. Nineteen other states also have joined with Wisconsin, so that the decision of the court will decide the issue in all of these states. The Michigan case is still before the United States District Court, Detroit.

Detroit—Representative business men of Flint have called on President Frank H. Alfred, of the Pere Marquette, to request that a branch line be laid in Flint to serve the Dort plant and also the new Durant plant. Mr. Alfred replied that the construction of such a line would be impossible at this time, as the Government had not adjusted the company's claim for several millions of dollars rental for the use of the lines. Mr. Alfred did agree to present the matter to the board of directors.

Toledo—The lake steamer Denmark has been towed to the docks of the B. & O. Railroad and is expected to be loaded soon, thus being the first lake boat being made ready for opening navigation on the Great Lakes. Reports from marine men say that the movement on the upper lakes may be started much earlier this year as the ice on Lake Superior is already disappearing.

INJUSTICE TO WALCOTT LATHE CO.

In connection with an article, "The Lathe Family," in the February 19 issue of the Michigan Manufacturer & Financial Record, seven illustrations were used, four of them appearing on Page 9. One of the four illustrations should have been designated as a Walcott lathe in use in the plant of the Detroit Gear & Machine Company, but by accident the name of the lathe was omitted, while all the other machines illustrated were properly identified. Realizing that this inadvertence, although unintentional, was an injustice to the Walcott company, the paper takes this means of rectifying it.

NORTHRUP LOCK ABOUT READY

The Northrup Lock Company, Brighton, is expected to start operations within the next sixty days. This is a new concern which will manufactcnre other articles of hardware besides the lock. The company plans to sell $50,000 of its stock in Brighton. According to reports, $22,000 of stock was disposed of recently within 24 hours.

CHAIR WORKS EXPANDING

The plant of the Oak Chair Works, Williamston, is being enlarged. The company specializes in designing rockers and dining chairs.

TARIFF ON SALT ASKED

The Mulkey Salt Company, of Detroit, has asked Michigan congressmen to use their influence to obtain a duty of $7.50 a ton on foreign salt. In explaining its suggestion, the company refers to German competition and states that American firms cannot compete with the German salt makers for the following reasons: Wages paid in Germany are lower than in the United States; extremely low ocean freight rates on salt, which in some cases actually do not exist because the salt is taken on for ballast purposes; increase of freight rates in this country to 111 per cent in three years, and the low value of the mark in foreign exchange. The freight rates and packing alone of domestic salt to be delivered to New York are said to be more than the price quoted for the German salt at eastern seaports.

WATERVLIET PAPER ELECTION

The following officers and directors were elected at the annual meeting of the Watervliet Paper Company, Watervliet: William M. Loveland, president; Charles B. Hays, vice-president; August B. Scheid, treasurer; F. D. Gilchrist, Director, the officers and J. B. Balch, W. M. Baldwin, R. A. Le Roy, Fred Scheid, John A. Pyle and Harrison Geer.

RETAIL HARDWARE ASSN. ELECTS

The convention of the Michigan Retail Hardware Association, held a few days ago in Grand Rapids, resulted in the election of the following officers: Norman D. Fopp, Saginaw, president; Charles A. Sturmer, Port Huron, vice-president; Arthur J. Scott, Marine City, secretary, and William Moore, Detroit, treasurer. The executive committee is composed of J. H. Lee, Muskegon; A. J. Rankin, Shelby; L. J. Cortenhof, Grand Rapids; Scott Kendrick, Ortonville; George W. McCabe, Petoskey, and George L. Gripton, Britton.

BUSINESS REPORTS OPTIMISTIC

A review issued this week by the Chamber of Commerce of the United States says that reports received from practically every section of the United States agree that the worst of the business depression has been passed and that from now on a steady, if slow, improvement is to be expected. "The most convincing evidence that we are on the high road to recovery is found in the report from every section of the country of steadily growing sentiment that 'business will be better in the spring,'" the review says.

INDUSTRIAL BUILDING

Progress, Projects and Contracts of the Week

Detroit—The week ended February 19 gave evidence of improvement in building activities. The report of the city building department shows that 284 permits were taken out, or 76 more than during the preceding week. The outlay represented was $694,990, as compared with $467,050, an increase of nearly $230,000. However, when compared with the corresponding week in 1920, the record is not so impressive, inasmuch as the cost for buildings a year ago for the same week was $3,062,000.

The list of contracts awarded during the two weeks ended February 17 does not show many important industrial projects, according to the lists furnished by the Builders and Traders' Exchange. Among the jobs awarded by contractors were the following: A steel sizing plant and boiler house for the Semet-Solvay Company; a two-story dormitory for the Wayne County poor commission; a high school building; a garage for G. J. Buckley, at Grand River near Kirby avenue. Sub-contracts were let as follows: Granite and re-enforced steel for the 18-story Julius Stroh building; roofing, sheet metal, painting and glazing for an office and store building, and a motor bus comfort station to be erected by the city at East Grand Boulevard and Jefferson avenue. It was also announced that W. S. Holmes, Lansing, let the contract for a brick and steel school building to be located in Monroe to Gratton Bros., Lansing, on a bid of $115,550. There were eleven other bidders. Among projects announced from the offices of architects as awarded was a five-story concrete warehouse.

As for projects in the hands of architects, the list shows a decided increase over the previous two or three weeks. The list includes the following: A 6-store and 6-flat building; a 5-store and 5-flat building, brick and steel construction; a brick veneer flat building; a 6-store and 6-flat steel and stone trim building, with 10 garages in connection, and a two-story residence and four-car garage. A variety of other construction includes a three-story brick and stone sales and service station; a two-story brick engine house; a 4-room brick grade school building; a brick and steel reinforced concrete lodge building and a three-story brick constructed sales building at Flint. There are also a brick reinforced garage and service station; remodeling of the five-story and basement warehouse for the Whitaker Paper Company; a four-story store, University of Detroit unit; a two-story and basement brick and stone school, to be erected in Grosse Pointe, and a two-story and basement 8-room school building.

Lansing—S. S. Riley, president of the Central Michigan Fanciers' Association, and others are backing the proposition to utilize the old bricks torn out of the East Michigan avenue pavement for the construction of a municipal show room and auditorium for automobile and machinery shows, trade and stock exhibitions.

Grand Rapids—The week ended February 11 was a decidedly better one than the previous two. The number of permits taken out was 23, or five more than during the preceding week. The cost involved was $66,025, as compared with $10,425. The two largest items were for a cement foundation for a church, to cost $13,000, and a residence, to cost $14,000.

Lansing—The Ideal Power Company, Lansing, is increasing its operations, and will be obliged to enlarge its facilities. The company is now employing about 175 men and turning out 40 complete mowers daily. The old plant of the Lansing Body Company, purchased some time ago, will be improved and additions built. The body company is liquidating its stock and will probably be out of business by May 1.

Detroit—Plans are being drawn for a new school of Commerce and Finance building for the University of Detroit, the building to be four stories high, 55x200 feet and to cost $200,000. It is to be completed by October.

Kalamazoo—During the week ended February 12 six permits were taken out, involving an expenditure of $8,930. During a corresponding week in 1920 two permits, representing $5,200, were issued.

Grand Rapids — The Owen-Ames-Kimball Company has been awarded the contract to build the coal pulverizing plant of the Grand Rapids Malleable Iron Works, to cost about $35,000. J. Herman & Son have been given the contract for foundations for the new plant of the Noon Lake Ice Company, to be constructed at Summer and Bowery streets, and which will cost between $80,000 and $100,000.

Detroit—Daniel B. Luten, Indianapolis engineer, has submitted a plan for the Belle Isle bridge to the common council, which provides for a reinforced steel and concrete span to cost $2,400,000 or $2,200,000, according to the type of approach desired for the Island end. This estimate is nearly $2,000,000 lower than any of the bids submitted by engineers who have figured on the work. As the matter stands now the voters must agree to an increase of about $2,000,000 before the bridge can be built according to present plans. Mr. Luten asks 10 per cent of the cost estimate as his fee. Following the announcement of Mr. Luten's suggestion, the Detroit Engineering Society sent a communication to the common council urging that no bridge plans be made or accepted unless approved by prominent engineers and suggesting that a board of five engineers be appointed to examine all plans. The society asks the council not to accept plans for a cheap bridge.

Jackson—The S. S. Kresge Company has taken in over the building to remodel the lower floor of the Carter building at a cost of $25,000 preparatory to opening a new store to be known as the 25 cents to $1 store.

Detroit—With the total during 1920 industrial building reached a valuation of $12,000,000, the total value of all building during the year approximating $20,000,000, according to figures made public this week by the Department of Building.

Lansing—A. T. Vandervoort, retail and wholesale hardware dealer, has begun the construction of another warehouse on property leased from the New York Central Railroad. This is the third warehouse Mr. Vandervoort has built on the tract.

Detroit—The Associated Building Trades Employers' Association of Michigan has passed resolutions recommending a 20 per cent reduction in wages of building trades employes throughout the state.

Washington—Retail lumber dealers, before the ways and means committee of the House, declared that a tariff on lumber would increase the lumber bill of the American people about $80,000,000 annually and greatly reduce all kinds of building, for which reasons the retail lumber trade was opposed to any tariff.

Detroit—When the action of the American House Wrecking Company against Henry Ford and Edsel Ford and the Ford Motor Company to recover damages for loss of contract to wreck the River Rouge naval training station was brought before Judge Ormond F. Hunt in circuit court last week, Judge Hunt dismissed the suit on the ground that it had been brought into the wrong court. It should have been, he said, a replevin action. The plaintiff claimed to have lost $60,000 as a result of losing the contract, and that the Fords were to blame by reason of delays in the progress of the work caused by them.

Jackson—Three permits were taken out in the city during the week ended February 5. The outlay represented was $6,050.

HOLLAND CASHIER CELEBRATES

Henry Luidens, cashier of the First State Bank, Holland, celebrated the thirtieth anniversary of his connection with the institution, February 22.

Supreme Court Decision On Assets Sales Tax Pends

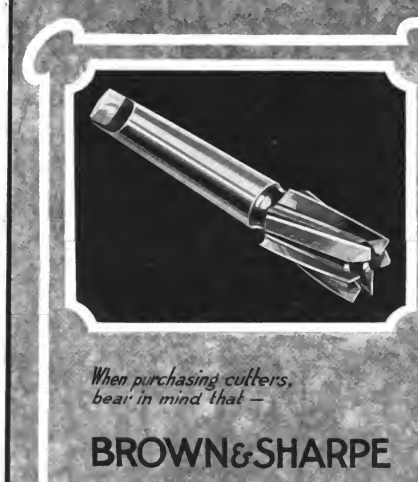
On December 16, 1920, there was decided before the district court of the United States for the District of Connecticut the case of Frederick F. Brewster vs. James J. Walsh, collector of internal revenue for the district of Connecticut. The point at question concerned income derived through an increase in value of capital assets when realized by sale, or other disposal, by one not a trader therein.

The decision was against the collector, it being held that income derived from sale of capital assets was not taxable income. An immediate appeal was made to a higher court.

This case is now well known in industrial, legal and accounting circles. However, a question has arisen from the practical application of this decision in its relation to 1920 returns.

Can the case be considered as authority for not reporting income realized from the sale of capital assets?

There can be no doubt of the fact that until a higher court reverses the opinion of the district court of Connecticut the case will stand as the law of the land. Whether the U. S. Supreme Court will agree with the lower court is, of course, not known. The case is pending. However, it seems to be the opinion among many accountants, attorneys and executives of high rank that the district court will not be supported in its opinion by the higher court. If this is true, individuals, corporations and industries at large relying upon this decision to save them from reporting heretofore taxable income earned during the year 1920 will be obliged to file amended returns covering the profit in question.



For this reason it would seem advisable at the present time to hold up all returns where a question is involved regarding taxable profit on the sale of capital assets until a later date, says Wesley W. Richards, manager of Jonathan B. Cook & Company, public accountants, Muskegon. It is, of course, not necessary to file returns before March 15, and it is not improbable that a decision of the higher court will be handed down prior to that date, or that one of the smaller cases pending in other courts throughout the country will be decided before that time.

The fact that a taxpayer does not claim a deduction from profits does not, of course, stop him from filing an amended return at a later date should the case carry through the supreme court.

GROUP SEVEN BANKERS MEET AT FLINT

About 175 bank officers and directors of Group Seven of the Michigan Bankers Association met at Flint Tuesday of this week for the annual spring meeting. The delegates assembled at the new Durant Hotel at noon and at 1:30 all sat down to luncheon as guests of the Flint banks. After the luncheon the ladies departed to attend a function of their own and left the male contingent to go into the program, the principal numbers of which were a talk by R. B. Locke, manager of the Detroit Federal Reserve Bank, on general business conditions, and a paper by R. M. McConnell, vice-president of the National Bank of Commerce, Detroit, on the subject of "Financing the Automobile Dealer." The substance of Mr. McConnell's remarks was that the dealer was making a mistake by discounting his paper with the various finance companies which operate throughout the state, for the reason that the paper eventually is shouldered by the banks and therefore it should come to them in the first place.

The question box, which is an important feature of the Group Seven meetings, was in charge of Horace Potter of the Citizens Commercial and Savings Bank, Flint, and the usual keen interest was shown in this department. C. S. Mott, president of the Industrial Savings Bank, Flint, gave the address of welcome

When purchasing cutters, bear in mind that —

BROWN&SHARPE

Carbon & High Speed Steel

CUTTERS

Give highest returns per dollar invested.

B&S cutters are the result of fifty years' experience in the manufacture and use of milling cutters. The shops around you will insist that B&S cutters give longest service and reach the maximum of Cutter Economy. They know from experience.

DETROIT, SATURDAY, FEBRUARY 26, 1921

Things May Look Up Now

THE GREATEST single consumer of manufactured products in the United States is the railroad system. That industry came out of the war in bad physical condition, as was natural because it had gone into the war in poor condition, had been subjected to immense strain during the war and had little improvement made upon it while it was subject to the war-time strain. When rehabilitation was apparent on the return of the railroad properties to the control of their private owners, the funds were not available. The government owed the railroads more than $600,000,000, which was not repaid. Increases in passenger and freight rates were authorized, but the sum of these seems to have been taken up by the increased labor costs which were authorized during the governmental regime. It seemed reasonable, therefore, that the debts which were due by the Government should be settled as soon as possible, to make the resources of the companies available for betterments. However reasonable this may have seemed, the state of the law was interpreted by the Government's officials to be that until an exact settlement of each account could be arrived at, no partial payment on such accounts could be made. A marked example near at home was that of a sum owed by the Government to the Grand Trunk Railroad. The bulk of this account was undisputed and payment of the whole sum hung on settlement of some few minor items. So the railway company had to bring some form of suit against the Government to bring about a settlement. The same situation seems to apply to every railroad account with the government.

The history of Government accounting and settlement of war-incurred obligations indicates that they are almost interminable, so that the situation which existed in regard to the payment of the Government's obligations was very far from promising. The House bill, in Congress, providing for partial settlements in the way of payment for undisputed items in the Government's guaranty of return for the use of the property of the railroads was intended to cure the situation, and did. That it has now passed the Senate and gone onto the President for his approval is an indication that the railroads may now undertake rehabilitation as soon as they come into possession of what is due them. That Senator LaFollette, of Wisconsin, tried to prevent the passage of the bill in the Senate simply indicates what a cheap old skate Senator LaFollette is, in that his anti-corporation virus poisoned his system against a proceeding manifestly just and gave him a new opportunity to appeal to base sentiments.

With the railroad payments in the way of being made, there is promise of better things in the way of supplying railroad materials. There is a bad condition of existing tracks and bridges affecting a large percentage of the railway mileage of the country. There is a bad condition of motive power affecting all but the very great systems. The car shortage for normal business is quite as pronounced as it was in times of normal demand, despite the fact that the abnormal conditions have released 300,000 cars and upwards from the demands of the service. The reopening of business will mighty soon catch up with this temporary oversupply and bring about a shortage again. The railroad managements are thoroughly informed about these conditions and the availability of money to provide for betterments can have no other effect than to bring about orders which will revivify steel mills, put foundries and machine shops into work and make a demand for timber. The promise of speedy settlement of the railroad claims against the Government means a very large drop in the bucket of improvement for general business conditions.

The Hardest Blow at the Private Banks

PERHAPS the strongest blow that has been struck against the continuance of private banks in Michigan is that which comes out of the death of "Deacon" George Ellis, of Grand Rapids, and the condition in which his death seems to leave the depositors in his private bank. George Ellis was an honest and a forceful man, despite the fact that he was unconventional and a bit contentious. A student for the ministry, a homesteader in the West, a baseball manager, a professional pool seller and gambler, a public official with a keen sense of duty who always kept his feet on the ground, a controversialist with the order of things that are, George Ellis had seen a good deal of a good many sides of life. Among them was banking, and he decided to have a fling at that. He paid a higher rate of interest than his state-organized competitors, and attracted depositors. He kept his banks open from an early hour in the morning to a late one at night. He invested his depositors' money very largely in municipal bonds, which were very safe and fairly liquid. He got his share of the bumps, no doubt, but he played his banker game along lines which tended to minimize his share. He kept a safe reserve in cash. He was a man in middle life, pretty healthy, and with no pressing notice that he was near the jumping-off place and should make provision for the segregation of his banking assets and liabilities from those which were purely personal. He was accounted a rich man in his own right. He gathered in nearly four and a half millions of deposits, and his private bank was the biggest one in Michigan, although it was far from being the greatest in the United States, as some of the perfervid writers about it now declare.

But George Ellis had not counted on death and succession in his banking business. A bank must have continuity. It cannot close up shop on one day with the status of a bank, and fail to open up on the morrow because its owner has died during the night and his death put deposits and resources into

Digitized by Google

the status of claims against his estate and assets thereof, respectively. His checking accounts cannot be subject to withdrawal at will one day, and the next be in the status of claims to go before the commissioners on claims appointed by the probate court. There seems to be even no probate law to expedite the settlements, so that the death of Mr. Ellis, equally as the death of any other private banker, leaves a condition of moratorium, so far as the depositors are concerned, that must extend through the six months required by commissioners to consider and report on claims. In other words, the private banker's credits to his depositor customers have become simply valid claims against his estate, to be distributed in the orderly way provided by law for the distribution of the estates of deceased persons.

There is no doubt that George Ellis' depositors will eventually be paid in full. But that was not their implied contract when they deposited their money. The time that they were to be paid was not eventually, but now, if they chose to call for their assets. There are 15,000 of them, it is said. So that the emergency of death in a business which could have gone on in beautiful shape during life has interfered with the business plans and relations of 15,000 people, if not to embarrass them, at least to cause them annoyance and fears lest their funds be not again available for use.

George Ellis' private bank was easily the best example of the system that Michigan has ever had, and it has turned out not to be death-proof, which, after all, a bank should be if it is to serve its purposes. The great success of Ellis' venture has simply exaggerated the danger which grows out of lack of continuity. There is no cure for such a situation by requiring private bankers to segregate these trust accounts from their general property holdings; because such segregation would bring another element of weakness, namely, the establishment of a relation of trusteeship which might be construed as not making available, in a pinch, the private resources of the banker.

If George Ellis had lived, he might have found a way to correct this weakness, because he was a very resourceful and scrupulously honest man. But he who counts on death waiting on his plans counts on that which he may not control.

The Harmfulness of Exaggeration

EVERYBODY is pleased at every item of improvement in industrial conditions in Michigan and elsewhere, and everybody is taking account of such items as they are announced. Such items are being daily made public, but nothing is to be gained—indeed very much harm is done—by exaggerating the statements of improvement. This harm comes out of the fact that every interest involved is on the qui vive to be accurately informed concerning the improvement of business conditions. These interests include labor, as represented by the men who are out of employment; banking, as represented by those who will have to provide the banking facilities required by active industry; transportation, as represented by those who will have to provide the facilities for rolling raw materials in and fabricated products out, and a host of lesser but proportionately important interests. A series of statements of fact of improvement in conditions will bring these interests into harmony with the situations as they accrue and find them quite ready for the return of normal activities. A series of false alarms can only be harmful in leading labor to be over-expectant and banking and transportation to be under-prepared.

Short Measure Stuff

SINCE THE BOYS FEEL THAT WAY, OF CORSET STAYS OFF

IT IS SAID that Grand Rapids girls check their corsets the same as they do their coats, hats and rubbers when they go to public dances there and the girl that does not either go without her corset or check it is not asked many times during the evening to dance.—From the Coral (Mich.) News.

ENTER THE FIRST ROBIN SWEEPSTAKES

Entries for the First Robin Sweepstakes are still being received. Yesterday we worked in our own garden, spreading breakfast food for the early birdies. Afterward we took a post of vantage and waited for the robins to appear. There were sparrows of all kinds, pacifists, militants, gluttons, some who merely came to scratch, but no reds. We were reluctantly called from the scene of action by the head of the house, who insisted that there was work to be done. Of course, we wouldn't have claimed the prizes had we won, but we might have tried to capture said robin and asked where his cousins and nephews were headed for, in the interest of other entrants. Watch for him.

With Charles Evans Hughes secretary of state, there won't be quite so many scraps on paper. —A. F.

These false alarms have been repeated in Detroit and Michigan during the past few weeks, and are wholly the result of inaccurate reporting by the daily press or of an actual desire to misrepresent conditions for the purpose of selling papers. For instance, a Detroit paper announced the other day that the C. R. Wilson Body Company, of Detroit, would immediately put on 600 men. The actual number was one-third of 600. The American Motor Body Company was announced as starting last Monday with a force of 2,000 men. A body of 600 was nearer the fact. The Ford Motor Company was announced as adding 4,000 men to its force. The fact, as far as can be found out, was that 2,000 men were asked to go back to work. Similar statements about the Continental Motors Corporation and about various plants up-state have turned out to be exaggerations.

Prosperity is not built on lies, even upon daily newspaper lies. The facts about bettering conditions are all welcome to all the people. Neither lies nor liars have a place in the re-establishment of public or industrial confidence.

FINANCIAL

THE BUSINESS OUTLOOK

By PHIL S. HANNA

WITH the idea of getting on the outside and looking in, so far as Detroit is concerned, the writer interviewed several upstate business men and bankers the early part of the week. Their expressions of opinion may throw some light on the situation as they see it.

Arthur G. Bishop, president of the Genesee County Savings Bank and the First National Bank, Flint, asserted that while Flint had been hit a man's size blow by the depression, the savings deposits of his banks were beginning to show a come-back that was encouraging. Unemployment has been greatly diminished by the return of many single men to their homes in surrounding towns and cities. Cashier Grant Brown, of the Industrial Savings Bank, expressed the opinion that the last three months had seen a steady and continued improvement in the business of the city, as evidenced by the merchants' reports of sales. There seemed to be a few vacant stores in Flint, but vacant houses were not plentiful. It appears as if the relief due to the moving away of unemployed had simply given the families heretofore jammed up tight, two or three to a house, a chance to spread out and get their breath and stretch their legs. Optimism seems to be bred into the Flinters, and he who tries to put a wet blanket on the contagious optimism in the vehicle city will get a cold reception.

Over in Saginaw a like sentiment was expressed, although the Saginaw people never reached the same heights of enthusiasm and imagination as has always obtained in Flint. Yet in Saginaw they are going along cheerfully and the ages of accumulated wealth in the city are being added to daily. Cashier Julius Hollandmoritz, of the Bank of Saginaw, said that savings deposits were going up right along. They hesitated a little during December but did not slide back and since Christmas have increased steadily, the total now in his bank being more than $12,000,000, a high record. Mr. Hollandmoritz observed that at Christmas there were many gifts of gold coins and bills and right after Christmas many of the same tokens came right back into the hand. A few large depositors made withdrawals to snap up choice bargains around the first of January but the number of new accounts being opened is a new high record and where savings depositors formerly earned $10 a day and deposited $1 in their accounts, the same persons are now depositing a much greater proportion of their earnings in spite of the earnings being much smaller.

There is a snug little city over in Tuscola county named Caro that also atomizes cheerfulness. The business of the city is almost exclusively supplying the farmers, and notwithstanding the misfortunes of the latter during the last season, the banks of Caro report an almost normal level of deposits and a particularly gratifying growth in savings business.

The city is admiringly showing off the new $100,000 bank building of the State Savings Bank, and judging from the number of farmers met along the road between Saginaw and Caro who were driving new coupes, limousines and sedans, the latter are still a long way from bankruptcy.

There is going to be a little fuss over the sugar situation. It was stated that the companies' offer of $6 a ton for sugar beets, with a sliding scale of advance in case market price increased, was not meeting a pleasant welcome among the beet growers. Some of the wiseacres, however, have it figured out that sugar will be much higher by the time the seed goes in, and in that event it is expected that the farmers will be lined up without difficulty.

On the whole, the general sentiment as regards the immediate future is greatly improved at the present time, and conversation with some fifteen or twenty bankers from Gratiot, Ingham and surrounding counties, who were in attendance at the bankers' group meeting at Flint on Tuesday, bear out the statement.

NEW INVESTMENT FIRM

John H. Buxton, Jr., formerly a mining engineer of Northern Canada and latterly for two years with the Charles R. Murphy Company, Detroit, stock underwriter, and Roy E. Foley, also with the Murphy company the last five years, have formed the investment banking firm of Buxton, Foley & Company, with offices in 420 Free Press building, Detroit. Mr. Foley is a native of Watertown, N. Y., and has been in Detroit 12 years. The firm will engage in handling the bonds of the Wayne County Bond & Mortgage Company and the bonds of the North American Bond & Mortgage Company, and will also specialize in the stock of the North American Bond & Mortgage Company, in addition to dealing in municipal and railroad bonds.

MICHIGAN STATE TELEPHONE

The annual report of the Michigan State Telephone Company for the year ended December 31, 1920, has been sent out to stockholders. Below is given a comparison of the income statements for the year just ended and for the previous fiscal year ended December 31, 1919. In comparing figures, account must be taken of the fact that the figures for the year 1919 do not include the revenues accrued to the federal government and the expenses borne by the same during the period of government control, from January 1, 1919, to July 31, 1919. The net returns, however, exhibit a splendid improvement, which should be gratifying to stockholders, and as well to the public who are telephone users, for a public utility company that does not make a fair return on its investment cannot give good service. (A comparative balance sheet will be published next week.)

Comparative Income Statement

	(Cents omitted)	
Operating revenues	$14,344,100	$4,337,373
Operating expenses	13,276,079	4,619,289
Net operating revenues	$ 1,068,026	$ 318,084
Deductions—		
Uncollectible revenue	48,223	27,772
Taxes assignable to operations	632,491	126,456
Operating income	387,311	163,855
Add—		
Non-operating revenue	147,164	111,102
Compensation as per Government contract		962,478
Gross income	534,476	1,237,436
Deduct—		
Rent and miscellaneous	119,375	49,976
Interest	1,645,586	1,462,356
Dividend appropriation		180,000
Amount carried to surplus	1,230,485	*454,892

*Deficit charged to surplus.

President Kuhn's message to the stockholders in connection with the report will be summarized next week.

MAYNARD TO GRAND RAPIDS

Beginning April 1, A. J. Maynard, vice-president of the Traverse City State Bank, Traverse City, will become a resident of Grand Rapids and begin his activities as a director and vice-president of the Grand Rapids National City and City Trust and Savings Banks. Mr. Maynard is well known as one of the leading bankers of northern Michigan, having been connected with the Traverse City institution for 19 years. He is also president of the Peoples State Bank, Boyne City, vice-president of the Kalkaska State Savings Bank, Kalkaska, and interested in various other enterprises. Maynard is a Detroiter by birth and still considered one of the younger bankers in the state.

GREENE GOES TO FEDERAL RESERVE

Bruce F. Greene, Jackson, who has been with the State Banking Department off and on for some four years, resigned his position as state bank examiner February 7 to accept a similar position in Chicago with the examination department of the Federal Reserve Bank of Chicago. Greene will be remembered by the Michigan bankers as a young man of something over 200 pounds avoirdupois and he made an enviable record in his work. He was for about a year a captain in the army.

OWOSSO SAVINGS BANK CHANGES

A. D. Whipple, heretofore cashier of the Owosso Savings Bank, and W. S. Cooper, who has been assistant cashier, were elected respectively vice-president and cashier, February 15, both well merited promotions, Mr. Whipple having been with the bank 30 years and Mr. Cooper 16 years. Deposits are reported as $2,253,095.

New Export Problems

Mere order-taking in foreign trade has had its day. Though American shipments of foods, merchandise and materials over-seas continue large, exporters in every line recognize that the turn in the tide has come.

In future, goods that go abroad must first be sold. Customers must be sought, studied, served. Markets must be developed and connections formed on a basis of information and analysis even more exact than those required in securing business in the past.

In making contacts with unfamiliar markets—in keeping touch with changing conditions—in carrying out the financial or shipping operations required in over-seas transactions—the Irving's Foreign Service and Foreign Trade Divisions may be able to supply you with just the information, counsel or banking and commercial aid you need. For exporters—as well as importers—Irving spans all seas.

Furniture Makers Ask Payne Rates on Veneers

Z. Clark Thwing, Grand Rapids, president of the Veneer Manufacturers Association, appeared before the ways and means committee of the national House of Representatives, last week, and asked that a tariff of 35 per cent ad valorem be placed on veneers coming into this country. This is the rate which prevailed under the Payne-Aldrich bill, but under the Underwood bill passed eight years ago veneers come in duty free.

Thwing declared foreign veneers were making serious inroads on the American industry. Competition comes from Great Britain, Germany, Finland and Japan. Under the Payne-Aldrich bill there was practically no competition. Thwing said he had been in the furniture business 32 years and knew conditions at home and abroad. He said low wages paid abroad enabled the foreigner to undersell the American market, the rate of exchange also operating in favor of the foreigner.

Asked whether the veneer manufacturers had been forced to cut wages, Thwing said they had made a cut of 10 per cent and would be compelled to make another 10 per cent cut if competition was allowed to continue.

While Chairman J. W. Fordney was not inclined to say in advance what the committee would do, it is known he favors giving to the furniture industry all the protection it wants.

DRUGCRAFT CO. NAMES OFFICERS

The Drugcraft Company, Ann Arbor, has elected the following officers: J. Harry McCormick, president and general manager; E. B. Manwaring, vice-president; H. M. Cole, treasurer; R. O. Taylor, secretary. These officers and S. G. Kress, J. A. Wilcox, Frank J. Davidson, all of Ann Arbor, and W. G. Van Natter and Clifton B. Hitt, Detroit, make up the board of directors.

*The previous quarterly of the American Bosch was $2.50.

**The previous quarterly of Michigan Sugar was 2½ per cent, with an extra dividend of ½ per cent.

†The extra dividend of Napoleon Motors is payable in script redeemable August 1, 1921.

***The previous quarterly dividend of the Peerless Truck & Motor was 75 cents, paid in January, and compared with $1.25 paid for the previous quarter.

****This is the first dividend declared by Standard Oil of Indiana on its new $25 par value stock. Previous dividends of company were on basis of $1 quarterly, with $5 extra, or at the rate of $25 a year.

‡In addition to a cash dividend of 5 per cent, the directors of the Scoville Manufacturing Company voted to distribute 4½ per cent in Fourth Liberty Bonds with April 15 and subsequent coupons attached. Each stockholder of record February 14 is entitled to receive these bonds to an amount equal, at face value, to $50 for every five shares of stock standing in his name.

Lord Bond Tax Measure Passed by the House

The House at Lansing this week passed unanimously the bill of Rep. George Lord, Detroit, to place on the tax rolls the bonds of all municipalities and states, other than Michigan. This class of securities up to this time has been required to pay a specific tax of one-half of one per cent, in lieu of all other taxes. The tax is required to be paid only once. The Lord measure continues the specific tax on Michigan state and municipal bonds of this class, but exempts them from the annual levy.

A bill sponsored by Rep. E. B. Ramsey would permit cities of 50,000 to 100,000 population to extend the present limit of 10 per cent of assessed valuation of bonded indebtedness for public improvements in any proportion they might choose. Other bills provide for a reduction in the monthly rate on delinquent taxes as a penalty from one to one-half per cent; permission to cities to condemn more property than needed for public improvements; increase in fees for notary public from $1 to $5; permission for any school district upon majority vote to bond itself to 15 per cent of its assessed valuation; danger signals on all switches on the main line of every railroad, and permission for Grand Rapids to increase the school tax from six to nine mills.

Delay in the passage of an appropriation bill to complete the state office building has been caused by Sen. James Henry, Battle Creek, who has asked the state auditors to furnish the Senate with a full account of the money thus far spent. When the building was authorized four years ago, $800,000 was appropriated. This was expected to be sufficient. Increased costs intervened and the 1919 legislature appropriated an additional $975,000. Now $1,140,000 more is wanted to finish the work, making the total nearly $2,000,000.

A concurrent resolution introduced by Rep. Arlie L. Hopkins, Manistee county, expressed opposition to a tariff on Canadian lumber, and is directed to Michigan congressmen. It declares there is a housing shortage and such a tariff would work a hardship on home-builders and farmers.

TO DOUBLE FURNACE OUTPUT

The Marshall Furnace Company, Marshall, at its annual meeting elected the following officers: President, F. K. Berry; vice-president, C. H. Billings; second vice-president, D. M. Jobbins; secretary, W. Mackie; treasurer, M. F. Jacques. A dividend of 10 per cent was declared and the announcement made that unless something unforseen occurred the company would make 8,000 furnaces this year, which would be twice the 1920 output.

THE OLDEST HOUSE IN MICHIGAN

FOREIGN GOVERNMENT SECURITIES

Foreign Government Bonds are looked upon with a degree of uncertainty by many investors. This is a misconception due to lack of investigation. We are recommending for purchase certain issues of countries not involved in the recent war, which were sold abroad prior to 1914 and which may now be bought at such a discount that the purchase can obtain a high yield on a bond which has every element of safety. Due to the fact that a number of these issues are payable in Foreign Exchange, the purchaser also has the opportunity to profit by the rise in exchange.

H. W. NOBLE & COMPANY

318 Dime Bank Building Detroit, Michigan

Better Business

The anticipated improvement in business is already evident in many industries. More settled values and more dependable earnings are being established.

Write for Letter F-8, which describes bonds and notes that still yield large returns and are obligations of corporations benefiting by the trend towards normal price levels of commodities and service.

FLOWER RECEIVERSHIP CHANGE

On February 15 the Union Trust Company, Detroit, filed its resignation as receiver of the Flower Valve Manufacturing Company in the Wayne circuit court and the Security Trust Company was appointed to fill the vacancy. The Union Trust Company is trustee under a mortgage securing an issue of first mortgage bonds, and because of conflicting interests found it difficult to act as receiver under the circumstances.

The receiver was first appointed under a bill of complaint filed by a stockholder and a creditor on May 13, 1920. Since that date the receiver has been operating the valve plant and through its operations has been able to liquidate a portion of the bonded indebtedness which fell due within the period of the receivership.

The plant is located at Parkinson street and M. C. R. R., in the western part of the city. It consists of more than six acres of land with large buildings especially constructed for the business, and the foundry and machine equipment is of the most improved type. The production is principally large valves and fittings for water and sewer work, and is largely sold to municipalities and corporations requiring the conveyance of liquids in large quantities. As of December 31, 1920, the assets of the company are listed at $1,410,162.37 and the liabilities at $881,891.85. The plant has a number of large orders on hand and in negotiation, and the Security Trust Company is continuing the operation.

EDISON REPORT FOR JANUARY

The Detroit Edison Company reports net profits of $317,613.09, after charges and interest, for the month of January. This is an increase of 4.4 per cent over the same month of last year. The gross revenue was $2,135,951.10, an increase of 15.01 per cent, and the operating and non-operating expense $1,561,951, an increase of 13 per cent, leaving net income of $573,999.78, an increase of 21 per cent. Deduction for interest leaves the net of $317,613.09.

GOODLY DIVIDENDS PAID

The American State Savings Bank, a consolidation of the American Savings and Lansing Savings Bank, opened for business last week with assets of $5,000,000, capitalization of $500,000 and reserve of $250,000.

In the equalization process resultant of this consolidation, the Lansing State Savings Bank paid its first stock dividend in the history of its 29 years of business. The dividend amounted to 100 per cent and was in addition to a 90 per cent cash dividend, also the result of the equalization. The bank has always paid a conservative semi-annual cash dividend, and any profits in excess have been allowed to accumulate.

The officers and directors of the combined bank are: J. Edward Roe, president; W. K. Prudden, S. H. Carpenter, M. R. Carrier, C. E. Bement, D. E. Bates, Charles E. Toms, L. C. Abbott, vice-presidents; Chas E. Toms, cashier; C. A. Schray, assistant cashier; E. D. Gibbs, assistant cashier; J. C. Phalen, auditor; L. L. Sattler, manager North Lansing branch; B. L. Berry, manager industrial branch.

Directors: L. C. Abbott, H. J. Baker, D. E. Bates, C. E. Bement, W. Brogan, S. H. Carpenter, M. R. Carrier, J. P. Edmonds, W. S. Foster, C. F. Hammond, H. F. Harper, H. A. Haze, Jacob Himmelberger, J. P. Hopkins, H. B. Lundberg, W. K. Prudden, J. G. Rentter, J. Edward Roe, R. C. Rueschaw, L. L. Sattler, E. C. Shields, H. C. Teel, C. E. Toms and Otto Ziegler.

FRANK H. HUBER PROMOTED

Frank H. Huber, assistant secretary of the Mishawaka Trust & Savings Bank, Mishawaka, Ind., has been promoted to be secretary-treasurer of the organization. Mr. Huber is a former "farmer boy" from Charlotte, Mich., who later studied at a business college in Ypsilanti and started in his banking career with the Union Banking Company, of St. Joseph.

M. C. EARNS $4,668,280

For 1920 the operating income of the Michigan Central Railroad was $4,668,280, as compared with $16,934,172 in 1919. Gross income totaled $87,555,206, or $10,000,000 less than the year before.

GENERAL CIGAR PROFITS

The net available for dividend distribution on the common stock of the General Cigar Company was $15.12 a share at the end of 1920, as compared with $12.64 in 1919. Total profits after deduction of federal taxes and charges were $3,400,019.

AMERICAN CHICLE STATEMENT

Stocks and bonds and treasury stock	2,107,002.00	1,320,774.13
Land, buildings, machinery, equip., less reserve	4,373,430.33	3,700,932.19
Patents, trade marks, good will, etc.	2,159,432.36	2,165,392.35
	$23,493,833.13	$20,323,385.93

LIABILITIES

Notes, accounts and interest payable	$ 3,334,332.04	$ 1,774,433.19
Reserves for taxes, bad debts, etc.	53,034.13	547,006.90
Funded debt—		
Bonds	2,047,500.00	2,102,500.00
Serial notes	2,380,000.00	2,500,000.00
Capital stock, pfd.	2,000,000.00	2,000,000.00
Capital stock, com.	10,352,844.99	8,000,000.00
Surplus	2,000,371.41	2,895,743.74
	$23,493,843.16	$20,823,685.33

PROFIT AND LOSS ACCOUNT

Gross profit from sales after deducting cost of material, labor and manufacturing expenses	$ 4,394,171.45	
Plus other income	230,117.33	
Less selling, advertising, administration, taxes, etc., including $141,740 depreciation on plant	$ 3,787,329.19	
Interest charges	424,365.69	
Dividends paid	331,173.00	
Balance carried to surplus	160,918.50	
Plus surplus at beginning of period	2,895,743.74	
	$ 3,056,662.24	
Less adjustments and loss on inventories as of December 31, 1920	1,056,291.23	
Balance December 31, 1920	$ 2,000,371.41	

A noteworthy change in the company is the substitution of 151,408 shares of common stock of no par value for 80,000 shares of common of $100 par. In the balance sheet of December 31, 1919, common stock was credited as $800,000 and surplus was $2,895,743.74, or a total of $3,695,743.74. In the December 31, 1920, statement the equity applying to the 151,408 shares of no par common stock is credited as $10,352,-944.59 and surplus is $2,000,371.41, or a total of $12,353,315.80. The difference between these totals is $1,457,572.06 and neither the profit and loss account nor the surplus account changes appear to show where the gain in common stock equity arose. The 80,000 shares of common of $100 par a year ago had a book value of $136, whereas the 151,408 shares of no par value are covered by an equity of $12,353,315, and the book value is about $81.

KANAWHA & MICHIGAN

The net operating income after taxes of the Kanawha & Michigan Railroad for the year 1920 was $676,140, as compared with $166,843 in 1919

SAXON'S REPORT

The balance sheet of the Saxon Motor Car Corporation, Detroit, for the year ended December 31, 1920, shows total assets of $7,321,092, as compared with $6,936,417 for April 1, 1920. Inventories were $1,779,038, as against $747,495 for April. Surplus was $4,286,700, a decrease of $116,116 from the April total.

INSURANCE MEN MEET MARCH 1

Under the auspices of the Detroit Life Insurance Underwriters' Association, 1,000 insurance salesmen will meet in Hotel Statler, Detroit, March 1. Orville Thorp, president, and Charles W. Scovell, past president of the national association, will be the speakers.

PARKER RUST PROOF

There is presented herewith a resume of the annual report of the Parker Rust Proof Company to its stockholders as of December 31, 1920, together with a comparison with the balance sheet for March, 1920 (exact date not given). A comparison of surplus account at the end of 1920 with the amount of surplus at the end of 1919 shows that the same was changed from a deficit of $229,545 on December 31, 1919, to a positive surplus of $69,622 on December 31, 1920. Rate of net earnings against capital outstanding as of December 31, 1920, was 2.69 per cent on the whole capital, notwithstanding the practical cessation of business in the last four months of the year.

ASSETS	Dec. 31, 1920	March, 1919

Borrower vs. Banker

(Continued from Page 6)

deposits went off $11,000,000, while loans jumped up $35,000,000. And about April 15 total loans exceeded the loanable portion of deposits, with the result that on May 1 total loans reached $413,000,000, while loanable funds were but $388,000,000. Consequently the banks had to borrow on that date the difference of $25,000,000 to replenish their reserves; or if you look at it the other way around, they borrowed the amount in order to lend it to their customers.

The growing tightness of money during May, June, July and August of last year is well remembered no doubt, and particularly so by the defendants, for during this period, while deposits grew only $2,000,000 and loans decreased but $8,000,000, it was necessary for the banks to increase their borrowings $17,000,000 to a total of $68,000,000 on September 1. And to make our clients' jobs more unpleasant, loans went up $4,000,000 during September, while deposits went down $20,000,000, so that our much maligned banker friends found themselves borrowing $34,000,000 on October 1, to take care of their customers, instead of $25,000,000 that they were borrowing on May 1 for the same purpose. Up to the end of 1920 the ratio remained about the same; and while we are on this subject it seems timely to refer to another feature of this reloaning process, namely the supposed profit in the operation.

There was a time, during the first five months of 1920, when a bank could rediscount your paper at 6 per cent and collect 7 per cent, but as the rate schedule, which is interlined at the bottom of the sketch, shows, at the time this was possible, the banks were carrying large amounts of Certificates of Indebtedness which, as explained in the foregoing, were then commonly hypothecated with the Reserve Bank to provide funds for purchasing same, with the result that the borrowed money inhibit thereby created was so large that further borrowing with the object of reloaning at a higher rate would have subjected the banks to penalties. The gentlemen of the jury, is substantially the fact as regards this allegation, although our clients in fairness will not deny that possibly one or two of their number may have taken occasional advantage of the rate differential early in the year when reserves were ample and demand strong. However, the percentage of total loans thus handled was exceedingly negligible, because as soon as the Government began to take up its enormous bulk of floating paper, up went the discount rates, and not only was incentive removed but the well known deflation process set in shortly thereafter, and the banks found themselves forced to rediscount paper at 7 per cent upon which they collected 7 per cent. The exhibits prove this contention. From the middle of April it was necessary to borrow to take care of the necessities of customers and it was on June 1 that the reserve bank rate went to 7 per cent for eligible paper.

We submit, on behalf of our clients, that the business interests of Detroit are deeply indebted to the Detroit banks for carrying this extra loan load of from $25,000,000 to $34,000,000 during the last eight months of 1920 without profit or compensation, and it is furthermore submitted that, so long as this extra load continues, equilibrium is not accomplished, and until the people by their savings have built up deposits or the borrowers have reduced their loans and a condition of normal balance restored, further undeserved and misleading criticism against the Detroit banks be omitted.

Public Utilities

Detroit—Large users of steam power furnished by the Detroit Edison Company will save from $15,000 to $20,000 a month as a result of a further 5 per cent discount on bills announced by the company, the discount to be effective from December 15, 1920. The company has allowed a 5 per cent discount, but when power users asked for lower rates because of the present business situation, the company responded with an additional 5 per cent.

Saginaw—John Leidlein, Saginaw, has been elected president of the Valley Home Telephone Company, succeeding Martin L. Debats, Bay City, who was killed recently by robbers.

Grand Rapids—The city commission and the Grand Rapids Railway Company have decided upon a replacement valuation of the city lines of $10,578,241, without allowance for depreciation. This valuation was worked out preparatory to considering a service-at-cost-plan when the company's franchise expires in April. The company has been allowed a 7 cent fare and in January earned profits of $179.53, the first in three years. The deficit is $270,000.

Williamston—The report is current in Williamston that the Detroit Edison Company will purchase the local power and light plant. Negotiations are said to be in progress. It is reported that if the deal is consummated the plant here will be discontinued and local users connected up with a power line from Fowlerville.

Detroit—The Detroit United Railway has given its permission for the crossing of its tracks by the lines of the municipal railways, provided the plans and specifications for the crossings are submitted for approval by the company's engineers.

Saginaw—Directors of the Valley Home Telephone Company have been re-elected. They are Otto Born, Dr. R. W. Brown, W. A. Collins and A. H. McMillan, Bay City; Charles Woolhan, Birch Run; James Gibbs, Ithaca; Henry R. Martini, Sebewaing, and W. F. Hemmeter, John Leidlein C. W. Liken and Clyde O. Trask, Saginaw.

Detroit—Judge Arthur C. Denison, Cincinnati, sitting for Judge Arthur J. Tuttle in federal court, has decided that the city cannot tear up the Harper avenue tracks of the Detroit United Railway, as such action would be a violation of the day-to-day agreement.

Public Utility Bonds

Yielding 7.40% to 8.00%

We offer well secured bonds of established public utility corporations serving large cities.

Merrill, Lynch & Co.

Members New York Stock Exchange

1056 Penobscot Bldg., Detroit

Chicago, New York, Milwaukee, Denver, Los Angeles

MUTUAL HOME & SAVINGS

For 1920 the Mutual Home & Savings Association, Grand Rapids, reported receipts totaling $2,360,723; earnings divided, $168,673. Cash on hand December 31, $22,061. Loans totaling $114,800 were made for the building of 42 homes; $125,300 was lent to pay mortgages on 49 homes; $155,175 was lent to pay contracts on 70 homes; $719,575 to buy 268 homes; $20,500 for improvements on 12 homes and $20,000 for miscellaneous expenditures on 14 homes. The stockholders elected as directors for three years Clarence E. Peck, William C. Sheppard and Harry E. Hosken.

PORT HURON FETES WILLS

The Chamber of Commerce of Port Huron gave a dinner this week in honor of C. Harold Wills, president of C. H. Wills & Company, Marysville. The dinner was in reality the closing event of "a perfect day" not only for Port Huron and Marysville but for the whole St. Clair river district, for it was on Thursday, the day of the dinner, that the Wills automobile plant, completed, was thrown open to public inspection. Prominent men of the district and several from Detroit gathered around the tables at the Harrington Hotel to do honor to Wills and his associates. The speakers said that the people of the district were coming to realize only now the real meaning of the coming of the Wills-Lee industries, which in the course of only two years have transformed an immense site which was practically bare land, into a center of industrial activity. Reference to Henry Ford was made and some of the speakers predicted that in time the name of Harold Wills would be as widely known as that of the Detroit motor magnate.

MICHIGAN PAPER CO. ELECTION

At the annual meeting of the Michigan Paper Company, Kalamazoo, the following officers were elected; President, J. D. Wagner; vice-president, E. A. Stowe; secretary-treasurer and manager, G. W. Gilkey; assistant secretary, C. Wagner; sales manager, T. D. Earl. The board of directors consists of George A. Ames, G. W. Gilkey, H. W. Jackson, R. D. Keppel, H. J. Mesick, H. Peigrin, E. A. Stowe, William Thomsen and J. D. Wagner. It was announced that the capital stock of the company will be increased from $1,000,000 to $2,000,000, in the shape of a stock dividend.

CITIES SERVICE BANKERS SHARES

Cities Service Company's distribution on its bankers shares, payable March 1 to holders of record February 15, will be 26.78 cents a share. The distribution, February 1, was made to 18,642 shareholders, an increase of 1,728 from January 1.

ST. CLAIR C. OF C.

Organization of the new St. Clair Chamber of Commerce has been completed. J. J. Gannon is president; Franklin Moore, first vice-president; John Schlinkert, second vice-president; R. S. Jenks, treasurer, and Charles Crissey, secretary.

Banks and Bankers

H. H. LARNED RETIRES

H. H. Larned, for 27 years a stockholder and director in the Lansing State Savings Bank, has resigned from the directorate. This practically means his retirement from business activity in Lansing. Previous to the consolidation with the American Savings Bank, Mr. Larned was chairman of the board of directors of the Lansing bank. For 10 years he was president of the bank, being succeeded by J. Edward Roe.

UNION SAVINGS & LOAN

Officers elected by the Union Savings & Loan Association, Lansing, last week are as follows: President, Christian Herrmann; vice-president, Frank B. McKibbin; secretary-treasurer, H. T. Donaldson; attorneys, C. F. and E. T. Hammond. Harold Andrews, Detroit, has been employed as assistant to the secretary and treasurer.

STANDARD SANITARY MFG.

The balance sheet of the Standard Sanitary Manufacturing Company for 1920 shows the net after taking care of preferred stock dividends and depreciation to be $2,728,890. This was equal to $22.74 a share on the common stock, as compared with $27.31 in 1919.

NEW CADILLAC BANK OPENS

The American State Bank opened for business in Cadillac, February 19. There are four departments: commercial, savings, bond and safety deposit. Peter Torbeson is president; C. J. Helm, vice-president, and Frank Coffey, cashier. The board of directors consists of E. W. Benjamin, Emil Brehm, Henry Curtis, J. C. Ford, C. J. Helm, Charles Nordell, E. F. Sawyer, M. E. Thomas, Peter Torbeson, John Willman and W. S. Williams.

INCREASE OF CAPITAL

Stockholders of the First National Bank, Manistique, have voted to increase the capital stock from $65,000 to $75,000 and the surplus from $15,000 to $25,000. Present resources of the bank are close to $800,000. The bank building will be remodeled some time this year.

GIBSON MANAGES TITLE CO.

Claire Gibson has assumed the management of the Title Bond & Mortgage Company, Kalamazoo. He has been for ten years with the Kalamazoo National bank, from which he retires as assistant cashier. The Title company announces that it has taken over the Taylor Title Company.

INVENTORY VALUATION

For Federal Taxation and Banking Purposes

Free on Request

FEDERAL Income Taxes are now engaging general interest. It was not strange, therefore, that when we published an authoritative discussion of Inventory Valuation in a recent issue, that there should have been a demand for copies which exhausted the supply and required us to prepare reprints.

The article was an extract from an address made by William M. Lybrand, President, National Association of Cost Accountants, before the January meeting of the Detroit Chapter of that Association.

The opinion and judgments of a specialist and unprejudiced observer on this important topic is presented. We want every banker, manufacturer, accountant, attorney and merchant to have a copy, which is why it was reprinted in booklet form for general distribution.

Inventory Valuation will prove helpful to those who seek or give credit, plan for the future or are concerned with the preparation of Federal Tax returns.

It summarizes principles of valuation that have stood the tests of time and that are governing in the present conditions.

Copies will be mailed free on application to

OFFICE APPLIANCE MEN MEET

Members of the Office Appliance Managers' Association of Detroit, attending a conference at the Detroit Board of Commerce, last week, heard the following speakers: C. K. Woodbridge, New York, sales manager, Dictaphone Company, and president, National Association of Office Appliance Managers; R. K. Russell, Chicago, general sales manager, Ditto Sales Company, and H. E. Ingram, Tonawanda, N. Y., general sales manager, Rand Company, Inc.

NEW KIRKGASSER PERSONNEL

An advertising agency was established in Chicago by George J. Kirkgasser the latter part of last year, and is now handling work for the Cutler-Hammer Manufacturing Company, Pawling & Harnischfeger Company, Wetmore Reamer Company and Frank D. Chase, Inc., industrial engineers. Mr. Kirkgasser was assistant advertising manager for the Cutler-Hammer Company from 1910 to 1914, after which he assumed the duties of advertising manager for that company. His new office is located in the First National Bank building, Chicago, and he is specializing in work for industrial concerns, although not limiting this entirely to technical fields. F. C. Smith, previously connected with the McGraw-Hill Publishing Company, has joined the new agency, and Miss A. A. Buchholtz, formerly office manager of the advertising department of the Cutler-Hammer Manufacturing Co., has assumed like duties with this agency.

"POWEROX" INTRODUCED

The Barrett-Cravens Company, Chicago, has brought out a new type of motor vehicle for industrial plants and yards under the trade name of "Powerox." It is a carrier-tractor with a chassis suitable for box, stake, platform or hopper bodies with a capacity of 3,000 pounds, and a tractor pulling power of 20 tons on trailers. It is only 4x8 feet in size and has a four-cylinder, four-cycle motor capable of a speed of from one to 10 miles an hour, but can be adjusted to higher speeds. The motor develops 25 horse-power and is water-cooled. The specifications of the vehicle are similar to those of the best trucks.

UTRECHT'S WORLD FAIR SEPT. 6-16

American manufacturers and traders are invited to send their representatives to the First International Industrial Fair which will be held in Utrecht, Holland, September 6 to 16.

Since 1917 national fairs have been held in Utrecht, the geographical center of the Netherlands, with increasing success each year. In 1919 the number of exhibitors was little below 1,300, including all branches of Dutch industry. The importance of these events soon spread beyond the Dutch frontiers. In 1919 no less than 1,124 applications were received from abroad for entrance tickets, the greater part from Germany and Belgium. So great was the interest that the governments of Belgium, Brazil, Denmark, Germany, France, Japan, Norway, Ukraine, Portugal, Roumania, Sweden, Switzerland and China sent special commercial representatives to Utrecht. Under these circumstances the directors of fairs felt encouraged to plan an international event for 1921. Judging from experiences and from recent reports coming to hand from several foreign countries, the enterprise promises to be very successful.

OFFICE MANAGERS CONFER

The office managers of the several district offices of the Cutler-Hammer Manufacturing Company were in attendance at a general sales meeting held in Milwaukee last week under the direction of W. C. Stevens, sales manager of the firm.

MELVIN SIGN CO. REORGANIZED

The Melvin Sign & Advertising Company, known to Detroiters since 1894, has been reorganized. The new officers are: President, John W. Forest; vice-president, Malcolm R. McCallum, and secretary-treasurer, C. B. Shields. Mr. Forest, who for several years was sales manager for the late A. L. Melvin, has expanded the organization so that it has seven departments, as follows: Poster, painted signs, commercial signs, electric signs, de luxe bulletin boards, distributing and gold lettering. The Melvin Sign and Advertising Company is Michigan representative for the Hi-Glo Company, Wheeling, W. Va., which manufactures electric signs. The company intends to open branches in a number of cities throughout Michigan.

The Legislature and the Trucks

(Continued from Page 7)

and the cartage business will continue to increase its contribution toward government, state and municipal support and road building, and be willing to do it.

Speaking of the controversial attitude of the passenger car elect toward the motor truck division of the constantly moving public, the story is told of a group of state legislators out riding, whether for business or pleasure is not stated. Their car arrived at the rear of a large motor truck, when an amount of honking seemed to disturb. The road was none too wide and the heavily laden truck held the center of the stage, so to speak. Either the driver did not hear the honking behind him, or he was one of those perverse individuals who believe that both time and tide can be made to wait on man—if he drives a truck.

Shortly after this episode there appeared in the House a bill providing a penalty for neglect on the part of a truck driver to turn aside to let a passenger car pass. It may seem to many truck drivers that to have to take to the ditch to make room for a passenger car will be a hardship.

The measure just referred to does not work any financial hardship, but House Bill No. 57, introduced by Rep. DeWitt would, if made a law, drag some more of the truckmen's hard earned revenue away from him. This measure provides that every truck of more than a ton capacity shall carry a rear view mirror. This bill is, whether or not intended as such, a relative of the previously mentioned "road hog" bill, and, like it, discriminates against the truck for the very reason that where both could be attended to or become undesirable traffic conditions, the passenger car can be and often is as much of a malefactor as the truck.

The mirror bill requires trucks to have attached to them a mirror or reflector by which the driver will be enabled to see the road behind him. Such an attachment, it is assumed, would permit him to see cars approaching in the rear so that he could get out of the way, and also prevent the possibility of his backing down upon a car in the rear. Discharging him the mirror the driver might ditch his car or run down another vehicle or a person in front of his car, but of course that is up to the driver.

Mirrors of the kind used for this purpose can be purchased for as little as $1.50. There are about 47,000 commercial vehicles in use in the state, which are not all more than of one-ton capacity, but the majority of them are said to be. If only half of the trucks are more than one-ton capacity, the number of mirrors required would cost truckmen about $35,000, which would make such a law really worth while to somebody. The truck is a rough working machine. It carries heavy loads and has to take an immense amount of abuse. An attachment like a mirror, which must be set far enough out from the truck body to command a view of the road in the rear, would not last long on the average truck. Like gasoline and oil, the mirror expense should be classified under permanent maintenance costs.

Under power the truck jiggles when on the best of roads. On poor roads it either wallows or "undulates." The driver gazing into his shimmying mirror could not be held responsible for all he might see reflected from the road behind him. If by chance his efforts to concentrate upon the wiggly mirror to be sure the car behind him was not dancing the fox trot should result in his running some per son or car down in front, should he be held entirely responsible, or is this just a foolish question?

This One They Like

It is with considerable satisfaction that the trucking business dwells upon one measure introduced which does not seek to choke it and which is House Bill No. 25, fathered by Rep. McDonald. This measure provides that the license fee on automotive equipment shall be reduced 25 per cent for all residents north of the counties of Mason, Lake, Osceola, Clare, Gladwin and Arenac.

The contention is that owners of automotive equipment in the regions specified get only about half a year's use of their cars because of the condition of the roads, and that taxes are assumed to be charges against actual value received. Monroe county residents, especially those who are gunning for the trucking business, should be taken on a junket into the northern county to see the roads. They might not be so hard on the industry for one thing, and more thoughtful on road building for another.

The motor truck industry and the cartage business are not fighting this taxation because they object to all taxes and are determined to have the rights of the road entirely free of charge. The Detroit Transportation Association, representing 500 or more owners and users, is opposed to all the bills so far introduced, with the exception of Mr. McDonald's. F. L. Henk, executive secretary of this Association, and also of the National Team and Motor Truck Owners' Association, treats the proposed legislation in this light:

"We do not expect that the truck will entirely escape criticism, nor legislative restriction. Some restrictive laws are necessary and will be welcomed, but we do feel that most of the bills submitted to date in the Michigan legislature have the appearance of attempts to legislate the commercial vehicle off the roads. We favor legislation that will protect the highways and make them safer for the public. We expect to pay our share of the cost of building and maintaining good roads just as we are doing it now. What we do ask is—why aim at this business as an exclusive target for what might be recognized as unjust, discriminatory and destructive legislation when once the trucking industry and the cartage business is closely and fairly studied? So far as we know no legislation has been directed at farmers' wagons, tractors and agricultural equipment which use the roads constantly and do their share of damage to surfaces and bridges the same as traffic.

"It is generally recognized that motor truck transportation has come to stay; that it is necessary to the advancement of industry and commerce; that it has in the past saved communities from suffering and industrial reverses when other mediums of transportation were not effective, and was one of the great contributors to victory in the War. The industry that produces commercial vehicles and the business that uses them as its service equipment should be encouraged and protected, not heckled or crippled.

A Skin Game That's Legitimate

(Continued from Page 10)

then they are passed to the slitting machines, where the ends are thinned out, after which they go to the "feathering" machines, where a feather edge is put on the thin ends so that when the sections are glued together the joints will be smooth.

The glue is now put on to these thin ends and the sections are joined together, end to end, and pressed together in a hydraulic press under a pressure of 2,400 pounds. Sections which are to be used in the making of double and triple-ply belts are covered with glue the whole length and then allowed to set, this process being repeated several times before being pressed together. The material and workmanship is then inspected and then the belt is run through a machine which trims the edges and stamps the number of feet contained, this number appearing every four feet. The belt is wound on this machine, also. The next and last operation is that of polishing the edges.

The Detroit Oak Belting Company employs approximately ninety people when running under normal conditions, and turns out about 600,000 pounds of belting a year, all of which serves to advertise Michigan and the quality of its products to all parts of the world. This company sends a large part of its product to Cuba, where it is used in the sugar mills, and quantities are used in the southern part of the United States in the sugar and lumber mills. The Detroit Oak Belting Company has a representative in England, another on the Continent, and it recently has sent a man to the Far East for the purpose of placing Detroit Oak Belting there.

Among the other more prominent manufacturers of leather belting are the Charles S. Schieren Company, whose Michigan offices are at 515 Shelby street, Detroit; the Graton & Knight Manufacturing Company, offices at 462 Jefferson avenue, Detroit, and the Edwin R. Ladew Company, whose Michigan representative is the Charles A. Strellinger Company, Detroit.

BERKEY & GAY ELECTION

The last year has been a good one for the Berkey & Gay Furniture Company, Grand Rapids, which at its recent annual meeting declared a dividend of 8 per cent on the common stock. Officers were elected as follows: President, George G. Whitworth; vice-president and general manager, E. A. Wallace; vice-president and director, Lachlan MacLachlan; treasurer, W. J. Wallace; secretary, B. B. Warren. Directors: the officers and Mrs. William H. Gay and Jay C. Freeman, the latter being elected to represent the Berkey estate. Mrs. J. C. Rickenbaugh having resigned.

BATTLE CREEK INDUSTRIAL REVIVAL

The Nichols & Shepard Threshing Company, American Steam Pump Company and Duplex Printing Press Company, Battle Creek, are again keeping their regular forces at work, while the Duplex company has increased the number of employes. The A. H. Stove Company has reopened its foundry, and the Kellogg Toasted Corn Flakes and Postum Cereal companies are operating with reduced forces.

Investing in Prosperity

(*Continued from Page 8*)

merce. In this emergency we need to remind ourselves that 17 per cent of our total production is devoted to foreign business, that one-fifth of our agricultural and industrial population depends for livelihood on international commerce, that the remotest parts of the country are affected by our foreign trade, and that this is pre-eminently the time for freshened interest and activity in everything that pertains to foreign commerce. Now is the time, not later, when our competitors have regained control of world markets, routes of trade and the means of international communication, for American business to insist upon the return of our merchant marine to private ownership and operation; to insist that the foreign service of the Government be strengthened and made more efficient; that adequate cable and wireless facilities be established under American control, and that American enterprise shall enjoy the protection of its government wherever it goes on legitimate business.

Above all, America must be thoroughly impressed with its new responsibilities and opportunities as the foremost creditor nation. Fundamentally this involves recognition of the fact that if we are to continue profitable trade with the rest of the world, heavily indebted to us as it is, we must give them time to work out their debt—in short, we must give them credit in such amounts and for such periods as will enable them to rehabilitate their war-shattered industrial organism.

The Edge Act, passed as an amendment to the Federal Reserve Act, December 24, 1919, was designed to provide the machinery of relief. This law provides for the organization of corporations with minimum capital of $2,000,000, operating under the control of the Federal Reserve Board, to finance foreign trade. It makes it possible for foreign concerns to purchase American goods on credit running for as long as five years, without tying up the capital of the American exporter. These long-time credits will be based upon security offered by the foreign buyer, which in turn will serve as the basis for the issue by these Edge corporations of debentures to be sold to American investors. The amount of such debentures which a corporation may issue is limited to ten times its capital and surplus. Prior to the passage of the Edge bill, legislation was enacted permitting national banks to invest up to 5 per cent of their capital and surplus in corporations engaged in international financial operations, and in many states the law now permits state banks to invest in the stock of these corporations.

Despite the increasing gravity of the foreign credit and international exchange situation and of the slowing-up of trade everywhere with falling prices and creeping paralysis of business at home, the facilities of the Edge Act were not availed of in any large way until the close of the year, when the $100,000,000 Foreign Trade Financing Corporation, fathered by the American Bankers' Association, was launched at the Chicago conference in December. This corporation, which it is hoped to have in operation early in 1921, will have authority to make loans abroad and issue debentures to the amount of $1,000,000,000. By virtue of its large resources it will challenge attention and command respect and confidence both at home and abroad.

A survey of the world's business and credit situation makes it plain that there is urgent need for this type of financing corporations and that its resources will be fully utilized in making advances on longer time credit than is customary through the familiar sixty or ninety-day trade bill upon adequate and properly-protected security in foreign countries. As a whole people we loaned our Allies nearly $10,000,000,000 on faith without the pledge of any specific security; as individuals and business groups we must, even upon the selfish basis of self-protection, lend our credit to them as individuals and business groups in order that they may work out post-war rehabilitation and so be able to liquidate their indebtedness to us.

All these nations, some rapidly, others more slowly, are working to that end. Even for the countries of Central Europe new hope appears. The Council of the League at Geneva has projected a scheme to mobilize the national resources of these countries behind the manufacturer and merchant. Conditional upon their abandoning internal quarrels and taking steps to help themselves, private credit will be guaranteed by gold bonds based upon national assets. This elaborate scheme involves in a measure indirect nationalization of industry and trade, but these countries have become accustomed to government regulation, and the choice seems to be between some such system and utter ruin.

The measure of success of the foreign trade financing organization depends of course upon the willingness of the American investor to absorb the debentures put out by the corporation. American investors underwrote the nation's war obligations aggregating $25,000,000,000 within the space of about two years. Though the flaming zeal of patriotism which made that achievement memorable has passed, there is every reason to believe that the habits of thrift, economy and hard work learned in that great venture can be invoked in this new enterprise to help save the commercial world from demoralization. To sell hundreds of millions of dollars worth of debentures based upon foreign security will require the most deliberate planning, most astute organization and most masterly salesmanship. That it can be done and will be done we have no doubt. Its successful achievement will pioneer the way to other foreign investment activities, will hasten the rehabilitation of a war-torn world, will redound to our own prosperity, and will justify our boast—"America, the Creditor Nation."

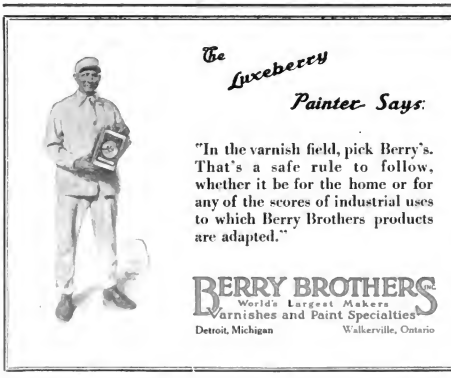
FEDERAL STAMPING, HOLLAND

The Federal Stamping Company, Holland, has just held its annual meeting, at which a proposal to increase the capital stock from $25,000 to $35,000 and declare a cash dividend of 7 per cent was ratified. The officers elected are the following: President and general manager, Thomas Olinger; vice-president and attorney, Thomas N. Robinson; secretary and general superintendent, John R. Spencer; treasurer, Henry Winter. The new board of directors is made up of these men and A. H., C. H. and E. C. Landwber.

EMPLOYES VOTE ON WAGE CUT

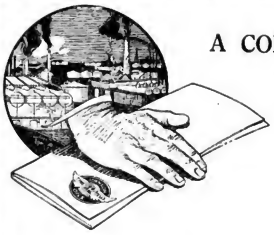
Before putting into effect a 15 per cent wage cut, the Kalamazoo Vegetable Parchment Company, Kalamazoo, asked the union and non-union employes to vote on the proposition. The present wage agreement runs until May 1, but the company desires to make the cut by March 1.

THREE MORE PLANTS RESUME



The Melling Forge Company, Lansing, has reopened its plant under a reduced production schedule. Factories of the Ypsilanti Reed Furniture Company at Ionia and Lyons have resumed operations.

LUMBERING IN KALKASKA



Owing to the exceptionally favorable weather, lumbering operations in Kalkaska county are said to be in better shape than ever. From the Wells & Avery camp, eight miles from Kalkaska, some record loads have been drawn. Some of these have been of between 4,000 and 5,000 feet.

DETROIT VENEER & PANEL

Stockholders of the Detroit Veneer & Panel Company, Cadillac, were told at the annual meeting that notwithstanding the business depression the latter part of the year, the company ended 1920 with a loss of only a few hundred dollars. The outlook for this year is beginning to brighten. The stockholders voted to sell the remaining $7,500 of unsold capital stock out of a total capital of $100,000.

Get a C-H Lifting Magnet For your Portable Crane

The C-H Lifting Magnet has become one of the necessary attachments of the portable excavator-crane along with the grab buckets, chain slings, and digging buckets;—iron or steel structural material, pig iron, bars, scrap—may be handled quickly and at low cost.

The full advantage of these portable machines are possible when a Cutler-Hammer Magnet is a part of the equipment because of the high capacity compared to weight.

Publication 855 on magnets will be sent on request.

This 5 Room Colonial Bungalow with Garage Complete → $894

Bungalow has Living Room, Dining Alcove, 2 Bed Rooms, Bath, Kitchen. Bungalow or Garage can be purchased Separately

Send for the ALADDIN Catalog Today

Price of above includes all material for completing both buildings—one hundred other California bungalows, Colonial Bungalows, Cottages, Two story Homes, and latest information on building conditions.

YOU are sure to find an Aladdin home to suit your tastes and pocketbook for the variety ranges from a few hundred dollars to homes costing fifteen thousand dollars completed. They are built of the very highest quality lumber to be had and designed and constructed according to the very highest architectural standards. They are not "portable," "sectional" nor "fabricated." They are real homes constructed exactly as any well-built home in your neighborhood. The Aladdin catalog gives all these details.

Present Aladdin Prices

are based on the below-cost figures. Rather than lose more money the great timber and lumber producers have already *closed down*. Common sense points to immediate action for the prospective home builder. Aladdin cannot continue very long to accept orders at present prices. *It's your opportunity.*

Read the experience of Mr. Gustave Anderson, of Lemont, Illinois, who recently wrote: "I am just finishing my new Aladdin Readi-cut Home. I have erected it on spare time only—some of my friends helping part of the time. We are very pleased with it and think more of it that I was able to build my own home, not being a carpenter myself. I found the blueprints very simple and did not have any trouble to speak of to find the place for the different pieces, and I was also very careful to follow the directions for piling the lumber, which was a great help. I found that material exceptionally good, and every piece went exactly where it was intended to go, and fit perfectly when put in place. The finishing lumber was particularly fine. I figure I have my home now at about half of what it would otherwise cost me, and I will heartily recommend Aladdin system of readi-cut homes to anyone desiring to build an exceptionally attractive home at a very low figure."

We have thousands of letters from satisfied owners of Aladdin Readi-cut Homes who have had the same experience as Mr. Anderson. No matter where you live there is an Aladdin Readi-cut owner near you to whom we will gladly refer.

Alladin System

Saves Labor. All the materials are cut to fit in the Aladdin Mills ready to be nailed in place on the job. This saves about 1/3 of the carpenter's wages.

Saves Lumber. The Aladdin system of standardized cutting to fit of materials saves 18% waste of lumber. This means **18% saving on the cost of the lumber.**

Saves Time. You purchase all the materials from one source and they are all on the job ready for you when you want them. Your home is not delayed for weeks and months before completion.

Send for Catalog 100 Attractive Home Plans

Send to Offices Nearest You

National Homebuilding Service.

Aladdin Homes are manufactured and shipped direct from the Aladdin Company's own mills in North Carolina, Mississippi, Michigan and Oregon. Wherever you live, Aladdin Homes come to you in a straight line from the nearest timber region.

Aladdin's National Homebuilding Service means shorter routes, quicker delivery and lower freight rates for builders in every part of the United States. Three days to a week are saved in shipments reaching destination.

Price Includes All Materials

The Aladdin Book of Homes has a message for you. Amongst its pages, profusely illustrated in colors, leading home designs are represented.

Aladdin homes are cut to fit as follows:

Lumber, millwork, flooring outside and inside finish, doors, windows, shingles, lath and plaster, hardware, locks, nails, paint, varnishes. The material is shipped to you in a sealed boxcar, complete. The book, "Aladdin Homes" gives complete information on the Aladdin guarantee which assures you of highest quality of material. Ask for book No. 2079.

Public Service Operations at Cost

A Review of the Conditions Under Which the Utilities Must Operate

IT MAY SEEM STRANGE to some engineers at first thought that it is within an engineer's province to have a hand with lawyers, municipal executives and utility management in framing the agreements, contracts, ordinances or franchises necessary to continued satisfactory operation of a public utility. But it should not appear remarkable if you admit that an engineer's work is something more than merely applied science, applied mathematics and certain accompanying uses of a drawing pencil.

An engineer's participation in business affairs like franchise-making is one more evidence of his ever extending sphere, of his widening influence and new responsibilities. There are daily realized more and more business negotiations where it is of particular advantage to have the proposed arrangements made with the aid of a man whose profession continually deals with the inexorable laws of cause and effect both in the inanimate world and in human relations; a profession which deals first hand with the service to be secured from materials, machines and labor; one which continuously has to count the cost of building and operating industrial works and living facilities, and daily weigh the factors that promote financial success or invite failure.

It would be preposterous to infer that the engineer alone possesses all the knowledge and skill essential to perfecting all sorts of business contracts. The business or municipal executive can see, best of any of us, no doubt, certain desirable aims and practical ways to these ends, like adjusting utility rates more or less automatically to varying costs of service; like insuring a definite interest return to investors and finding what is adequate under changing conditions; or like making it impossible to sidetrack developments obviously required in the general public good.

But we do find that the business executive more and more realizes that he is safer if he relies on the engineer to make sure that no natural laws are broken, that no impossible tasks are set, that what is cited as cost includes all elements of true cost and excludes all fictitious things paraded as costs, that there is no mathematical juggling by which property is confiscated or unfair increments pyramided, that projected improvements will yield the promised results and not be expensive will-o'-wisps. The most successful business executive realizes that he can and should rely on the engineer in wider and wider fields for such service, as much as he relies on the lawyer to insure that the existing laws and ordinances affecting his business are compiled with, that his plans may not later be nullified by illegality, that clauses are not present in his contract which at some future time may change the whole intent and performance, or that the equities are always preserved between all parties.

By HARRY BARKER

Harry Barker, the author of this article, is an American engineer of distinction, associated with George W. Fuller, of New York City. He has been engaged for some time in appraisal and other work as the engineering counsel of the city of Grand Rapids, in the problems growing out of the fixing of adequate and just fares for the street railway system of that city. In view of the presentation of a "Service-at-Cost" proposal in Detroit affecting the street railway system, his views, being those of an engineer engaged on the municipal side of this question, are highly interesting.—The Editor.

In opening the discussion of such a business topic as "service-at-cost franchises," these few general remarks have seemed warranted as one statement of the platform of a growing group of engineers regarding their stand in relation to private and public business affairs.

The Place of "Service-at-Cost" Plans in Utility Regulation

The idea of keeping rates for public utility service close to cost is not new, though it has aroused more discussion in the last three or four years than before. The idea is as old as our present scheme of public regulation by commission. What is now talked of so much as the "service-at-cost" plan differs from the older regulation in two ways.

First, the rates and service are more automatically adjusted to costs as the latter shift from time to time. Secondly, a larger element of "home-rule" is injected into the regulation.

Under the older state regulation, to which we have become accustomed, if the utility company felt that costs were rising so as to warrant higher rates, it applied for an increase; and generally the move was contested by the customers. There was irritation and diminished confidence on both sides; unproductive expense and long delays were apt to ensue. These "service-at-cost" plans, now advocated, set up such municipal and company machinery as will, in competent hands, make prescribed changes in rates up or down according as certain agreed conditions appear and cost factors fluctuate up or down. This machinery and the duties laid on its directing officers are the substance of the "service-at-cost" franchises.

To get a correct perspective of the "cost-of-service" idea it is of some help to step inside a moment and view it from the angle of franchises in general and good franchises in particular.

The prime object of franchises for municipal utilities may be very generally summed up as the definite record of certain desirable ends which it is agreed to secure. Further than that, a franchise may lay down the ways in which the desired ends are to be attained.

In the first place, the object of the franchise is to insure good service for those desiring to use the particular facility, whether it be street railway, electric light power, gas supply, water supply or telephone communication, and where the community does not desire to undertake these services as a municipal enterprise.

What many regard as the next important object is to insure adequate extensions of the utility facilities and such improvements from time to time in the plant and property as may be judged essential to service which would be considered good, measured by standards prevailing from time to time.

From the public point of view the next important object of a franchise is to insure that the service is furnished at rates which in themselves are not greater than the service intrinsically is worth to the customer, are as low as the utility can afford to give and still stay in business, and do not unfairly discriminate between customers.

The next important object of the franchise is one which directly affects the persons who have invested their capital in the property and business of a public utility. Possibly sometimes the patrons of the utility temporarily forget that this also affects them, though indirectly. This is to reduce to a minimum the risk of losing the principal of funds which different people have invested in the plant and business of the public utility. The public is interested in this object, for it is common experience that if the risk of losing the principal is great, the investor will not put new money into the enterprise unless he gets a high rate of interest to compensate for the risk, and this of course is bound to be reflected eventually in higher cost or poorer service to the consumer. There is a related object of a franchise which affects the investor first and the customer almost as much, although in a different way. That is, the franchise should help the business insure a fair return on capital, and by fair return is here meant one which compensates for the use of the money and the special hazards of the business, if there are any, but one which also limits the return to such use and risk.

At this point the aims of the older types of franchises have commonly stopped. It is now seen that it is highly desirable if it is possible to work into the franchise some definite inducements for continuously improving the service, extending the facilities and introducing economies of operation whose final result is a lower cost of service to the customers.

These few fundamental points have been stated without regard to the nature of the utility. They should apply to all with equal

Digitized by Google

force, although the difficulty of drawing up a franchise successfully to embody all of these desirable objects may prove to be a much more difficult problem in the case of some utilities than in others. It would seem, off-hand, that the more localized and simple the service and the fewer the classes of patrons, the easier it would be to arrive at a franchise which satisfies all the fundamental requirements to the highest degree. When inter-city relations arise or the classes of customers increase and there are a variety of services rendered, necessarily complications arise, with troublesome details. It would seem as if a street railway franchise affords the best opportunities for working out a desirable plan and that a far reaching and complex service like telephone communication might become difficult.

Whether or not a "service-at-cost" franchise is a good franchise depends upon how carefully it has been worked out to fit the local conditions. It wholly depends completely upon how it satisfies the tests of any good franchise under local conditions. Its value depends upon how well the makers provided for its enforcement—for the regulation of the utility in conformity therewith.

The "service-at-cost" plan is not some wonderful ready-made automatic device which can be installed in the municipality and then left to itself to cause the utility company to meet every demand on it for service at nominal charges to the public.

But it is possible with the development of a "service-at-cost" plan, within a franchise or any operating contract, to promote good service, to induce extensions and improvements, to keep rates and charges most nearly reasonable at all times, to minimize the risk to the investor, to insure some approach to a fair return to the investor in lean years as well as in prosperity, and to offer rewards for producing better service and lower rates—all in a way and to a degree that no ordinary franchise can do.

The introduction of the complete "service-at-cost" plan into franchise making in many cases can be the key to the whole satisfactory solution of a difficult problem—whether the service is good or only fair, whether the facilities are ample or only meager, whether or not fares are sometimes extortionate and sometimes confiscatory, whether the risks of the business are severe or only ordinary, whether or not the return to the investor can oscillate up or down or be fairly stable, whether there is or is not an incentive to continuous progress and economy.

There are certain features of franchises which have become familiar through their general necessity of a framework but which do not distinguish the better from the poorer. For instance, authority and consent necessarily are granted to occupy the streets, to build, maintain and operate works and do business otherwise in devious ways. Commonly, certain express limitations and reservations to the authority and consents are introduced. The right of the community to purchase the works and business under generally specified terms is common, as is also the right of a community to name the purchases. The community sometimes lays down general rules and requirements fixing the service itself, or it may simply reserve the right to make such rules and requirements as promote public confidence and safety. Sometimes provision is inserted for a bond to insure faithful performance of the franchise requirements.

There are other features of a franchise not closely identified with the "service-at-cost" plan but which promote one or more of the desirable objectives previously outlined, namely, good service, adequate extensions, reasonable fares, minimum risk in invested principal, fair return on investment, inducements for better service or lower rates; and perhaps these ought to be at least mentioned in passing. For instance, in most cases it may minimize costs if a utility is given a monopoly of all similar services in a district, and in some cases it may improve the service and be economical in the long run. This means one light and power company, one water works, one gas company, one telephone company, one traction and transportation system operating trolleys and buses.

Another feature is that the cost of the utility of doing business, and therefore ultimately the cost of service to the customers, is diminished if the tax burdens are reduced to a minimum representing the company's participation in the benefits of government. The idea is to lay upon the utility no burdens merely to lighten the loads of others but as an whole, irrespective of whether the utility caused excessive expense or enjoyed peculiar advantage.

What Distinguishes a "Service-at-Cost" Franchise

Now to come down to those features of a franchise by which the cost-of-service idea is incorporated: One of the first requirements is to write in a basic value of the utility property as of the date of the franchise and to make provision for finding the value at any future date (say as the datum value plus the net cost of extensions, betterments and replacements, and less the amount of value in the datum for property sold, destroyed or abandoned not to be replaced, and less the accrued depreciation on additions, betterments and replacements so far as it has been earned and set aside or repaid.)

A warning is necessary that this is not a formula which can be blindly followed. In order to preserve equity between the company and the customers the way in which the datum value was arrived at should be known, the extent of depreciation in the various items, the history of the property and business since the date of franchise, and perhaps other matters, should be duly considered. Such consideration is the function of an engineer, and this fits in with other features of the "service-at-cost" plan requiring engineering supervision, as will be noticed later.

What seems to be the next important distinguishing provision is that service be given and the rates be periodically adjusted, so as to cover only the "cost of the service;" but including in this "cost" all the legitimate operating expenses, adequate allowances for repairs and maintenance, a proper allowance for accruing depreciation and required annual contributions to other reserve funds which the particular plan may provide.

Very closely associated with the provision just discussed are those provisions which regulate service and expenditures by a budget, made up in advance, approved by the company and any regulatory officer provided to administer the franchise. The provisions for expenditures that have been written hard and fast into franchises have been less desirable and the inevitable revision has been so painful and difficult that a flexible basis is conceded to be preferable.

Frequent and violent changes in rates are undesirable, because of the confusion created, because of the possibilities of excessive expense to the utility company in making the necessary changes in office practice, and because of the chances of mistakes and friction. One flywheel, some reservoir, is greatly needed in any "service-at-cost" plan to absorb the short passing fluctuations but to let the rates respond to sustained rises of fall in costs of labor and materials. Changes in some utilities may be permissible three to six months apart, while in others a year may be set.

This reservoir, or flywheel, is a fund variously called the "index," the "barometer," the "emergency" or the "surplus" reserve, etc. Perhaps it may be well here to confine reference to it as the "index reserve fund," as that indicates its purpose and nature. To this fund are added the annual operating surplus and from it are paid the operating deficits. In its simplest form, two levels are fixed for it. The lower level is reached by repeated or considerable drafts for deficits, then a rise in

(Continued on Page 38)

"Don't Slam the Door"--Henry Ford to a Banker

THE New York Mail prints the following:

"Local officials of the Ford Motor Company were loath today to discuss the affairs of the company, which became a matter of renewed interest with the announcement of the resignation of the seventh executive of the company, Hubert E. Hartman, assistant secretary and general counsel.

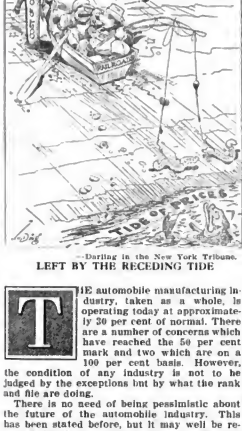
"One solution of the mystery of the disintegration of the official personnel, however, was offered by a man close to Henry Ford, who says that some of the officials left by request.

"The list of seven Ford men now looking for jobs includes Frank L. Klingensmith, vice-president; W. C. Anderson, European chief; Louis Block, branch manager at Philadelphia; L. H. Turrell, auditor; Charles A. Brownell, advertising manager; the Rev. Samuel S. Marquis, sociologist and head of welfare work, and Mr. Hartman.

"Klingensmith's penchant for amazing his listeners by talking big sums is said to be the reason for his 'resignation.' In New York one day, 'Kling,' as his former boss called him, is said to have casually asked a banker at lunch: 'What's the chance of getting hold of $100,000,000 today?' Kling had the satisfaction of seeing the banker gasp, but it seems the latter took the proposition seriously and started out to raise the money.

"Soon after this Henry Ford's office in Dearborn began to be the mecca of men from Wall street anxious to let Ford have all or any part of the sum he wanted.

"Ford has no friendly feeling for bankers as a lot, and he refused to let any of them get near him. That is, all but one. The story is told that he decided that in the interests of anthropology he should personally inspect one banker. So one was let in.



"With all the enthusiasm of his clan, this banker shop proceeded to unfold to Ford a plan for financing the great Ford plant. The plan soon revealed to Ford's satisfaction that the fellow was just like the bankers he had read about in books. The plan included a grip on the Ford industry in the interests of the banker and his associate. Ford terminated the interview in the middle by inviting the financier to pick up his hat and his bag and not to slam the door.

"Meanwhile the big Highland Park plant, just outside Detroit, has reopened, and more men are daily returning to work. And Ford himself has occupied his time when he wasn't firing assistants and dodging bankers by developing a gasoline-driven street car and increasing the efficiency of his plant by equipping it more fully with automatic machines. In his odd moments he has been experimenting with a cheap substitute for gasoline."

Sticking to the Facts

Automobile Industry Producing About 30 Per Cent Of Normal, With Only Two Concerns at Capacity

—Darling in the New York Tribune.
LEFT BY THE RECEDING TIDE

—Orr in the Chicago Tribune.
KILL TWO BIRDS AT ONCE

—Talbert in the Toledo News-Bee.
SPRING STYLES

THE automobile manufacturing industry, taken as a whole, is operating today at approximately 30 per cent of normal. There are a number of concerns which have reached the 50 per cent mark and two which are on a 100 per cent basis. However, the condition of any industry is not to be judged by the exceptions but by what the rank and file are doing.

There is no need of being pessimistic about the future of the automobile industry. This has been stated before, but it may well be repeated, for the reason that at present the condition of the industry is not as good or as satisfactory as so many exaggerated press stories make it appear. And it may be said in this connection that a good many of the officinis of manufacturing concerns who were questioned by the writer said that if the newspapers were not so anxious to overestimate facts, to exaggerate matters rather than to present the situation as it really is, it is likely that the automobile business would be better off.

The facts concerning present conditions in the industry are given herewith as nearly accurately as they could be obtained either from plant officials, manufacturers' representatives in Detroit, distributors or from other sources considered reliable, and in some instancest special reference is made to some of the exaggerated press reports already referred to.

Some Favorable News Omitted

There are a number of facts known to the writer and practically confirmed by the manufacturers, but which for some reason or other the latter do not wish to see in print or do not care to confirm. The reason for withholding publication of such information—which in every case indicates an improvement in the business of these concerns—is that these events, such as sizeable orders received or important additional releases of production, are not considered by the parties directly interested as normal.

By MARC BRAUN

"It is quite correct that we have received an order for supplies which will occupy several railroad cars and thus be a really big shipment," said one factory executive. "In fact, this is the largest shipment we will have made in many months. However, this is an exceptional order, an abnormal order, and therefore cannot be considered as a part of our regular business. As a matter of fact, regular, normal business is still low and the future is uncertain. The only thing we can do is to make a guess, and it's this guessing which has been going on in the industry which has been misleading everybody. We believe that the automobile business will improve in a marked degree, but just when and how rapidly is a matter impossible to state. Let everybody keep on working, working harder and harder, and the return of business will be hastened. That is the only positive remedy, and that is no guess either. It is a fact and the only thing that will help."

At the Continental Motors Corporation plant in Detroit there are now approximately 1,200 men at work, which is a rather considerable increase over the number only a few weeks ago, but still less than 50 per cent of normal, which varies from 2,500 to 3,500, the latter being the peak. The Muskegon plant of the Corporation is employing about 700 men, as against 2,500 to 3,500 normally. Vice-President G. W. Yeagan said to the writer that since his previous statemement as to the general business outlook in the automotive industry, made during the first week of February, matters had considerably improved.

"We have been getting re-orders and new business," he said. "By re-orders I mean that orders which had been held up are being executed. The new business, while not extraordinary in volume, shows, however, the trend on the right side of the ledger. Let's have a little more patience. Let's keep on being cautious and cool. Let's keep on working hard. The time of revival in the business is right at the door. This revival has started and it is going on slowly but surely. We are not going to have a spurt, but we are going to have the business increase gradually and sanely, and that is the safest and best way after all. No need of fearing for the future of the industry. It is as solid as the Rock of Gibraltar, taking the industry as a whole, of course. This year we will all be at it hard and working as we never did before, but I can see we are heading the ship toward a big year of business, possibly the biggest the industry has had. The concerns which will have weathered the storm of 1921 will be so much stronger next year and it will be all the better for all of us."

In Other Plants

The Liberty Motor Car Company, Detroit, is steadily increasing its output and putting on more workers, although in a measured way. Its sales executives have been making personal investigations throughout the country and in addition its district supervisors are canvassing their territory more thoroughly than ever before. Their reports indicate conditions to be very encouraging in the greater part of the country. At the recent automobile show in Minneapolis a fair number of cars were sold at retail, which was considered satisfactory, due to the fact that the falling-off in automobile business was especially marked in the Northwestern states for some months.

In Saginaw the Nelson Motor Truck Company has just announced that it has found conditions in general so much improved that production on full time basis has been started.

"We have a fair number of orders on our books for immediate shipment," said one of the officials. "Already we have made some fair shipments to our distributors in Pittsburgh, New York, Grand Rapids and a few other cities, and this only upon their request, thus indicating that there must be demand. Furthermore, the letters which we receive from many prospects throughout the country indicate a beginning of a more general revival in business."

The Saxon Motor Car Corporation, Detroit, is said to have a fair number of orders booked

Digitized by Google

and it is known that orders for a large number of bodies for its cars have been placed with one of the local body makers. Officials of the company feel confident that with the advent of spring there will be a steady increase of automobile buying.

Although it has been reported in the press that the Federal Motor Truck Company, Detroit, had been closed and had just resumed production, one of the company officials told the writer that the plant had never ceased to manufacture trucks but that output as well as employment of labor had been cut to a minimum during the period of depression.

"We have been making a number of trucks without interruption, but some people think that if a manufacturer does not produce at least 50 per cent of normal he is not producing at all," he said. "We are putting on more men this month and have increased our production schedule, and by the end of March we hope that we shall be on a 50 per cent basis."

Not Predicting

At the Packard Motor Car Company offices in Detroit the outlook is considered improved and confidence is expressed that from now on there will be an increase in sales. It is not the custom of this old-established house to make sensational statements. Officials say they expect to be able to increase Packard activities right along, but how soon they will approach normal is something they cannot predict. However, just as in the case of others, they believe that the industry is on the road to better general conditions.

The date of the reopening of Dodge Brothers is still uncertain. A rumor was current in the East that the plant would resume on Monday, February 28. It is still closed and the information was given out by an official a few days ago that nothing had been decided so far as he knew. In the industry and among dealers the continued idleness of Dodge is becoming more and more a matter of discussion.

Production with the Hupp Motor Car Corporation, Detroit, is said to be satisfactory, although not as good as it should be. Labor troubles are said to be the cause, just as in the case of several other motor car and parts making concerns.

In Flint the general situation among the manufacturers is said to be improving, although production is not anything near 50 per cent of normal, according to information from Flint dealers. One concern, the W. A. Paterson Company, is said to be more nearly on a normal basis than others, but this firm is not a large producer as, for instance, are Chevrolet and Buick. At the Hupp Motor Company offices it was said that output had reached 250 cars a day. Production at the Chevrolet Motor Car Company factory is variously estimated as being from 25 to 40 per cent of normal.

One of the most active Detroit plants is that of the Studebaker Corporation, which is now producing better than 50 per cent of normal. Only last night vice-President H. A. Biggs made the statement that a 50 per cent basis was hoped for shortly. It may be added that 50 per cent output has been attained also at the South Bend factory. The latter has a capacity at present of 3,750 cars a month and it is expected that the March production will total 2,500. At Detroit the capacity is 5,000 a month and for March a production schedule of 3,500 has been started. The Detroit plant, which has been operating on a 4-day basis, is now being run five days a week, as in the case of the Indiana plant. Orders have been coming in in fine shape, stated one of the officials. In fact the business has come back quite a bit more rapidly than had been expected. It is not believed that there will be another slump.

The Fisher Body Corporation has one of its Detroit plants in operation and one of the executives said that production was at the rate of about 40 per cent of normal.

"We are decidedly disgusted," said this official, "to see in the newspapers practically every day some story or other about business picking up 50 or 100 per cent, about such and such concern adding a thousand or several thousand or several hundred men, about this automobile maker now making so many cars a day and this other one so many a month, and to know that it is all 50 per cent and more misstatement. We know what is going on in the industry and we cannot see what good it is doing to the industry to have things so grossly misrepresented as some of the newspapers are doing. It may be that the papers thus are finding a way to increase their sales, but they are not presenting the facts to the public as they are and as the public is entitled to know them."

Paige Around 75 Per Cent

Ford activities are a matter of guessing at what is actually taking place. No two Ford dealers see the same parts manufacturers supplying the Ford Motor Company seem to know anything accurate. Some claim that thus far —meaning since the reopening of the plant at

(*Continued on Page* 16)

Trust Companies and State Bank Trust Powers

THE original theory which governed the organization of financial institutions in Michigan was to the effect that the business should be divided into certain natural classifications, and separate classes of corporations organized to handle them. On this theory provision was made for commercial banks, savings banks and trust companies, the two former under the so-called Banking Law and the latter under the so-called Trust Companies Act. These laws, in establishing these three classes of institutions, recognized the differences in reserve requirements, in suitable forms of investment and in the general conduct of the three kinds of businesses. Under the Banking Law, opportunity is afforded for the combination into single institutions of the so-called commercial and savings banks, provided that, as regards its savings business, such a combined institution shall observe the regulations governing savings banks, and as regards its commercial business, the regulations governing commercial banks. With respect to trust companies, organized under a separate Act, no provision is made for combinations with commercial or savings banks under the general principles which govern combinations of these banks with each other.

Both banks and trust companies organized under Michigan laws were contented enough under this arrangement until a new element was introduced by the action of the federal government in ruling that national banks located in Michigan must have conferred upon them trust powers in order that they might successfully compete with commercial and savings banks—which, it will be noted, do not possess those powers. Very naturally our state banks have felt that in order to meet the competition thus forced upon them, they likewise must be given the privilege of doing, at least to some extent, a trust business. A bill was accordingly recently introduced in the state legislature conferring, subject to suitable regulation, trust powers upon the state banks.

By JOHN N. STALKER

Vice-President, Union Trust Company, Detroit

The attitude of Michigan trust companies, or at least most of them, with respect to the exercise of trust powers by state banks, has been much misunderstood, and a word of explanation would not be out of place. The trust business, particularly in some of its branches, is extremely technical. The requirements which make a capable and successful country banker are by no means necessarily the qualifications which go to make a successful trust officer. The training which qualifies the staff of a bank efficiently and capably to handle its business would not qualify it to handle the legal accounting which trust work involves.

The present record of trust administration in Michigan by trust companies is one of which these companies are very proud and of which they are properly jealous. They do not particularly fear the loss in business which may result from banking competition, but they are frankly jealous of the evil consequences if complicated trust work should be undertaken by small banks not equipped to handle it. They feel that the entire corporate administration of trusts would be discredited under those circumstances, and that they, would be the chief sufferers. As far as the question of competition is concerned, they believe that the educational work which the state banks would carry on in the direction of teaching the people to appreciate the value and economy in corporate administration of trusts would more than compensate for any direct loss of patronage. These companies, while believing that their view is the broad and progressive one, make no pretense of altruism, therefore, in welcoming the state banks into the trust field under proper regulation, and frankly admit that their desire to save the state banker from losses and unprofitable business in this field, while it is partly, is by no means wholly, out of consideration for the banker's own interest.

These trust companies further feel that while, as far as is known, none of them contemplate actively embarking in the field of commercial banking, nevertheless equity and fairness demand that with state and national banks both authorized to do a trust business, they should under suitable regulation be permitted the reciprocal right of doing a banking business.

With the foregoing ideas in mind, representatives of some of the more prominent trust companies met with the sponsors of the above mentioned bill a few weeks ago and agreed on a measure acceptable to both interests, which is now before the legislature and constructive piece of legislation. This bill provides that, with the approval of the Banking Department, state banks with a capital and surplus of $150,000 or over may open trust departments, and enter upon the transaction of a general trust business; that banks with a lesser capital shall be limited in the exercise of trust powers to the administration of the estates of deceased persons, either as executor or administrator. Trust companies, on the other hand, are given the right to open banking departments as regards their banking departments, the sound regulations which are now found in our Banking Law.

It is no longer profitable to discuss the question as to whether the limitations of particular banking and trust functions to particular classes of corporations is desirable. The entire field is open to state and national banks. The question now appears to be: Are our state institutions to be given the same privileges as the federal institutions with which they compete?

[EDITOR'S NOTE—Owing to the interest aroused by the presentation of the Watson bill in the Michigan Legislature, it has been deemed advisable to publish this article on the proposition of changing our state laws to grant trust powers in some form to state banks to put them on a par with national banks. Further contributions will be welcomed.]

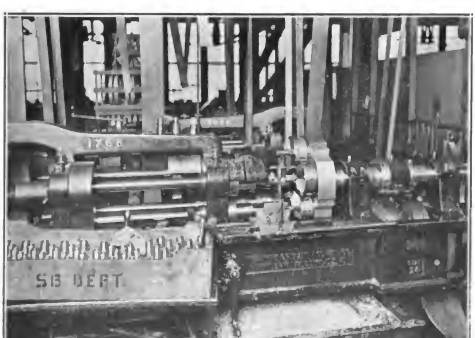
Screws and Screw Machines

Something About the Quantity of the Products Used In Michigan, and a Description of Their Manufacture

By HOWARD CAMPBELL



ACCORDING to Webster, a screw is "a mechanical device consisting of a continuous helical thread, with the shank from which it projects." It is generally conceded to be a most unimportant piece of the works; in fact its importance usually is recognized just after it has disappeared. However, more screws are used in modern machinery than of any other part, for without them it would be impossible to clean machinery or to replace damaged or broken parts. Consequently when one part gave out, the whole machine would have to be discarded. Having use for such a vast quantity of screws, it naturally follows that means of producing them rapidly and at low cost should be sought.

The first threads were cut with a single tool, and for many years this was the best way of making screws and bolts. The perfection of a die which would cut the thread on a great number of bolts before wearing out brought about the development of a lathe, with a turret in which several tools could be held. This turret was applied to the lathe about 1856, by an American named Stone. From this hand-operated turret machine the single spindle automatic screw machine was developed by Christopher M. Spencer, at Hartford, Conn., soon after the Civil War. This was the first machine in which a bar of stock could be turned, threaded and cut into pieces, the whole operation being entirely automatic.

The first multiple spindle automatic screw machine was designed by Spencer in 1887. This was a three-spindle machine, in which the spindles were superimposed one above the other and the tools brought into play by means of a large drum, on the outside of which were a number of cams. These machines were used for producing screws from wire in coils and were employed commercially for several years.

The four-spindle automatic machine now known as the "National Acme" was the next development, followed by Spencer's five-spindle "Universal." Then came the four-spindle "Gridley," the five-spindle "Davenport," the four-spindle "Cone" and the six-spindle "New Britain." It will be seen that the development of the multiple-spindle automatic screw machine has been a gradual increase in the number of work-carrying spindles.

The upper photograph shows a battery of Brown & Sharpe Automatics in the plant of the Burroughs Adding Machine Company. In the lower photograph a 6-spindle New Britain Automatic is shown making valve bearings in the factory of the Packard Motor Car Company. Production is 100 an hour.

The single-spindle automatic carried a turret in which were mounted various tools, which were presented singly by automatic means to the rotating work. The time of finishing the piece complete was the combined time of the several operations. The multiple spindle automatic presents each of its tools simultaneously to as many pieces of bar materials as there are spindles, and the time of finishing the completed piece is only that of the longest single operation or subdivision of that operation. It will be seen that a multiple-spindle machine must therefore have a sufficient number of spindles and tool positions to subdivide the operations without a too-complicated arrangement of cutters or an arrangement of cutters with which it would be difficult to maintain a proper degree of accuracy for continuous operation.

In this branch of machine construction, as in others, the constant aim has been to increase production and at the same time increase the accuracy of the product. Machine beds, slides and so forth have been increased in strength and weight, while moving parts, such as spindles, have been made lighter and at the same time stronger by the use of special alloy steels and heat treatment, hardening and grinding. Ball bearings decrease friction and permit of higher speeds.

Automatic screw machines are arranged to advance the stock and operate the tools entirely without the aid of an operator. As they accomplish automatically much that heretofore has

Digitized by Google

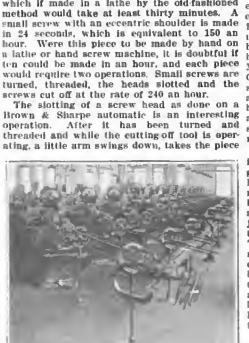
been done by hand, they are necessarily much more complicated than a hand-operated machine. When once set up, however, no further attention is necessary, except to see that the tools are kept in proper condition and to insert new stock when the bar is exhausted. Therefore one operator can easily attend to three or four machines.



A Variety of Operations

They are so constructed as to use tools for a great variety of operations, including those of plain and taper turning, forming to practically any shape, cutting off at an angle, center and cross drilling, threading, counter-boring, recessing, knurling, milling slots or spots, generating small spiral or worm gears, castellating nuts, and various others. Thus they are suitable for manufacturing a large variety of articles, other than screws, their ability to handle different kinds of work made from the bar being almost unlimited, up to their capacity. Accordingly they are of great advantage not only for the production of screws but also of various other small parts used in the building of automatic vehicles, sewing machines, typewriters, calculating and adding machines, electrical instruments and other machines and tools having small parts made from steel or brass rods.

The vast number of screws and similar parts required for the building of automobiles, gas engines and other similar modern machinery has been the means of developing a separate industry engaged exclusively in the manufacture of these parts. Some of these plants are equipped entirely with automatic screw machines, and turn out millions of screws, bolts, nuts and similar parts a month. Among these are the Automatic Products Company, Detroit; Federal Screw Works, Detroit Screw Works and Peninsular Milled Screw Company, also of Detroit, and the Michigan Screw Company, Lansing.

One of the best automatic screw machines for producing small parts requiring a high degree of accuracy is the single spindle machine, of which the Brown & Sharpe is prominent. The largest bar of stock that can be put into this machine, however, is 1⅛ inches in diameter, although the tools can be set to turn a piece 2¾ inches in diameter. Practically every operation that can be done on a hand machine can be done on the automatic, and many of them can be done much better, as every tool is controlled mechanically and the same amount of pressure is brought to bear on the tools as each piece is made. As every cut is controlled, no gauging is necessary as in the case where forming, grooving and similar operations are done by hand. The operations of feeding the stock, reversing the spindle and indexing the turret are regulated by trip dogs on cam risers on the cam shaft, the adjustment of the dogs serving accurately to time the operations. The turret slide and cross slides are fed to the work by the action of disc cams and levers, and as these cams are always used for the same job, it is very easy exactly to duplicate a previous lot of work, both in finish and in rate of production. The use of special attachments also is provided for on the Brown & Sharpe, and screws can be slotted, nuts castellated and other operations of this nature done before the piece leaves the machine. In the Burroughs Adding Machine Company's plant in Detroit approximately 300 automatic machines are kept busy turning out small but accurate parts for use in the production of adding machines. Pieces are turned, formed and cut off with the regularity of clock-work every two minutes, which if made in a lathe by the old-fashioned method would take at least thirty minutes. A small screw with an eccentric shoulder is made in 24 seconds, which is equivalent to 150 an hour. Were this piece to be made by hand on a lathe or hand screw machine, it is doubtful if ten could be made in an hour, and each piece would require two operations. Small screws are turned, threaded, the heads slotted and the screws cut off at the rate of 240 an hour.

The slotting of a screw head as done on a Brown & Sharpe automatic is an interesting operation. After it has been turned and threaded and while the cutting-off tool is operating, a little arm swings down, takes the piece from the chuck, swings back up with it and holds it in position while a small saw cuts a slot in the head. This does away with an extra machine for slotting, and the whole piece is completed in the time required to complete it without slotting. A similar attachment is used for drilling small holes in screws, studs, bushings and other pieces of this nature, thus doing away with an extra operation of drilling.

Section of the Automatic Products Company's plant showing a battery of 4-spindle Gridley Automatics.

For Larger Work

For work of a larger variety, but which also has to be quite accurate, the Cleveland Automatic frequently is used. The Cleveland Automatic Machine Company builds this machine, and it has not only established a reputation for accuracy but also is said to build the largest automatics in the world. These machines will handle bar stock of 7⅝-inch diameter, and they machine these immense bars with the same ease, speed and accuracy that the small machines perform their work. The Bower Roller Bearing Company, Detroit, has eight of these machines for use in the production of roller bearings, which, as every one knows, have to be mechanically perfect. The Fuller & Sons Manufacturing Company, Kalamazoo, has 25 Clevelands which are used for making transmission gears, another job requiring a degree of accuracy which could only be duplicated on a hand machine by an expert operator, and the amount of production would then be only a small part of the production from one of these marvelous machines.

Nelson Bros., Saginaw, use a battery of Clevelands for the production of parts for stationary gasoline engines, and both the National and Detroit Twist Drill companies use them for making drill blanks. In this operation the drill blank is turned complete, including the taper shank, all ready for the flutes to be milled. A job which will indicate the speed with which these parts are made is that of making a nut. This is turned, formed, the hole drilled, a shoulder cut and the piece cut off in seven seconds. In the making of piston pins from solid bar stock, the hole is drilled half way through the pin from one end, the ends are chamfered and the piece is cut off, at the rate of 60 an hour. The second operation, drilling the other half of the hole from the other end of the pin, takes 40 seconds, a production of 90 an hour.

All of the foregoing examples are taken from jobs where the pieces are made from and cut off a solid bar of steel. What are known as "second operations"—operations which have to be performed on the other end of the pieces, usually have been performed in hand machines, but the Cleveland company has now developed

Digitized by Google

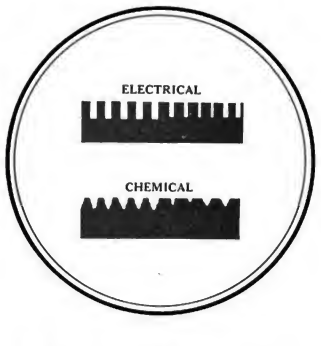
a magazine attachment for its machine which will hold a number of castings, forgings or parts made from bar stock in a previous operation. The magazine holds approximately 20 pieces, each of which is presented in turn as the finished pieces are dropped from the chuck. The piece is conveyed from the magazine to the chuck by means of a tool in the turret, which grasps the piece, pulls it out of the magazine, swings it around and inserts it in the chuck at exactly the right moment so that no time is lost. The magazines are built to handle work from ⅜ inch to 7⅜ inches in diameter, and not only produce them faster but also more uniform and more accurate than they could be produced by hand methods.

Multiple-Spindle Machines

Of multiple-spindle machines, the four-spindle Gridley is one of the most widely used and one of the most efficient. This machine is so arranged that four tools are working on four bars of steel at one and the same time. One tool will be turning the stock, one will be cutting the thread, a third will be forming the head or cutting the groove, while the fourth is cutting off a finished screw. Obviously, the time of making a screw is only as long as the time of the longest operation. As fast as a finished screw is cut off, the entire set of four spindles automatically indexes, presenting each bar of steel to each of the four tools in turn. The operator, of course, has to put the four bars into the machine and start it going, but from this time until the entire four bars have been used up, the machine works entirely automatically, requiring no attention unless a tool breaks or the machine gets out of order. The Automatic Products Company is one of the largest users of Gridley Automatics in Michigan, its equipment consisting of 265 four-spindle machines. The bulk of its work consists of screws up to ⅝ inch in diameter, and some of these are produced at the rate of 700 an hour from one machine. The production of screws and other small special automobile parts in this plant sometimes reaches as high as 14,000,000 pieces a month.

Dodge Brothers also use approximately 225 four-spindle Gridleys in the manufacture of screws and other small parts necessary for the great production of Dodge motor vehicles.

Another machine which is used for this class of work is the Acme Multiple Spindle Automatic Screw Machine, which is made by the same company that makes the Gridley machine. There is not much difference between the two types of machines, excepting that a number of auxiliary operations can be performed on Acmes, with the aid of special attachments, which cannot be performed on Gridleys.



An automatic machine having five spindles recently has been developed by the Davenport Machine Tool Company, which promises to make a place for itself in the next few years. The claim is made for this machine that it will turn out small parts quite as accurately as the single-spindle machine. In this machine the "turret" tools are mounted in sliding spindles, each of which is operated by a separate cam, which is calculated to provide for a higher degree of accuracy than heretofore has been obtainable with a multiple-spindle machine. In the Davenport the turret revolves, carrying the tools with it, making it comparatively easy for the operator to set tools, change them for grinding, etc.

Although this machine has been on the market only a short time, installations have been made at the plants of the Packard Motor Car Company, Cadillac Motor Car Company, Chelsea Screw Company, Burroughs Adding Machine Company, Brown-Maclaren Company, Lincoln Motor Company, Reo Motor Car Company and other plants throughout the state.

New Britain Chucking Machine

The New Britain Multiple-Spindle Automatic Chucking Machine is another development of

How Germany Is Succeeding In Winning Back Her Pre-War Trade

Commercial Agents Throughout Europe Underselling Rivals Because of Superior Manufacturing Methods

By P. H. MIDDLETON
Assistant Manager, International Trade Department, Guaranty Trust Company of New York

GERMANY is still a perfect industrial machine, running at low speed, it is true, but undamaged as yet in its vital parts, and would respond readily to any stimulus."

The above remark by a British government official who has recently been studying the industrial and commercial conditions in Germany sums up in a nutshell the present position of the Teutons. Undoubtedly the Germans are making a determined effort to mend the rents that have been torn by American and British manufacturers in the foreign trade net of the former German Empire. That they have made a good beginning is evident from the fact that German exports for the first five months of 1920 amounted to 23,688,000,000 marks, as compared with 10,057,000,000 marks for the entire year of 1919. It must be remembered, however, that these export figures include goods delivered to the Allies under the treaty of peace and also that from the signing of the armistice, in November, 1918, until March, 1920, an enormous volume of goods was smuggled out of Germany through the occupied territory, the so-called "hole in the West."

For the eleven months ended with November, 1920, the United States imported from Germany merchandise valued at $84,000,000, as compared with $10,608,141 for the entire year of 1919. Germany imported from the United States in the eleven months ended with November, 1920, merchandise valued at $253,000,000, as compared with $92,761,314 for the entire year of 1919.

Salesmen Throughout Europe

Thousands of German salesmen are reported to be at work not only in the former neutral countries but in all the European and Asiatic countries with which they were at war, offering low prices and long credits and promising quicker deliveries than their competitors. Buyers from many of the larger nations are now in Germany placing substantial orders for motor trucks, dyestuffs, toys, iron and steel products, pianos, glassware, knit goods, sewing machines, electrical goods and hundreds of other items.

The recent holidays have given a striking demonstration of the effectiveness of German plans to extend foreign trade. Some months prior to the end of the year warehouses in all the large cities in England were filled with German toys of all kinds. Representatives of German firms, including many Norwegians, Swiss, Danes and Swedes, canvassed the trade thoroughly, offering their wares at an average increase in price over pre-war days of about 100 per cent and promising quick deliveries. With the exception of dolls, which were priced at about 50 per cent cheaper than the English make, the general run of these German toys were priced about the same as the British toys of similar character. One German firm sold thirty different kinds of dolls in England, three of them at prices considerably below the English dolls. It is estimated that the sales of German toys in England in 1920 amounted to more than $9,000,000, compared with $1,850,000 in 1919.

In considering these results we must, however, remember that in the toy trade Germany has many things in her favor. It is a highly specialized industry, liberally supported with granis for scientific research, with technical schools maintaining special classes to teach toymaking, and that it is for the greater part an industry run on up-to-date factory lines where the advantages of large scale production are fully appreciated.

Some Other Low Bids

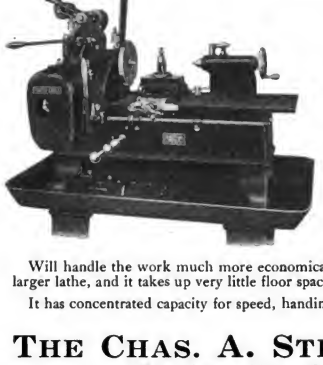
Other German articles which are arriving in England in large volume are clocks, chiefly of the metal alarm and china varieties, and fancy goods consisting principally of metal and glass ornaments. German nets, silk embroidered, are being offered for sale in Nottingham at a lower price than cost of manufacture in that center of the British lace industry. Godfrey Cheesman, the secretary of the National Union of Manufacturers, states that he has in his possession scores of business letters received by British firms from German manufacturers. The correspondence and catalogues are attractively written in English and most of the articles offered for sale are at about half the cost at which they can be obtained in Great Britain.

One firm in Berlin offers "Bosch" magnetos at £6 each in cases of five. These magnetos cannot be purchased in England in less than £12 each. These instances could be multiplied tenfold. Among the articles mentioned in the catalogue are German tools offered at 4 shillings each, which cost 15 shillings each in London. One German house offers vacuum flasks which are without any marks whatever. A London company has received an offer from Charlottenburg of three or four ton lorries at £600 each. A consignment has been booked by a British dealer to resell. Most of the English makes are double this figure.

Recent cargoes from Hamburg contained aluminum casseroles, dishes, saucepans, frying pans, kettles, glassware, paper, cotton gloves, sewing machines, thermometers, machinery, weighing appliances, furniture, toys, silk hosiery, motor cars, chlorides, asphalt, mouldings, brassware and meat-carving machines. Some of these goods are evidently from German pre-war stocks that could not be disposed of during hostilities.

Representatives of German dye manufacturers are carrying a wonderful range of colors in a wide variety and high quality. A British dyemaker states that the Germans are offering a certain dye which is much required in the finished trade at sevenpense to one shilling a pound, which he is unable to produce for less than four shillings a pound in a quality inferior to that of the German. Representatives of German textile houses are in England offering cloth dyed in 500 different shades. British makers state that it is impossible for them to produce cloth at the prices asked by the Germans, even after the big fall in the price of raw wools.

Former Neutrals Protest



The slowing-down of some of Britain's new industries, such as dyes and chemicals, photographic materials and scientific instruments, and in some cases the actual closing of factories as the result of German competition, have brought forth vigorous protests to the government and appeals for protection. The National Union of Manufacturers has been deluged with communications from its members giving specific examples of German price cutting. One manufacturer complained that children's rackets were being sold at 72 shillings a gross, while the British article could not be sold under 156 shillings; a three-quart kettle of British manufacture is being sold for three shillings and sixpence, while the German article is being sold for sixpense; a fine grade of German nail scissors is being sold at nine shillings a dozen, while Sheffield was selling them at twenty shillings; German pianos were being sold at seventy pounds, while British instruments could not be purchased in England for twice that money; German milling machines were being offered at seventy pounds, as against an English factory cost of one hundred and eighty pounds. German first class spectacle lenses are offered at nine shillings per dozen pairs, a price one shilling lower than the cost price of English third quality lenses; German books and eyes are being sold at four and one-half pense per pound, while the wire alone costs British firms six and one-half pense.

The British government stated some time ago that if an industry was in danger of becoming overwhelmed by the importation of goods at prices below the cost of production in England owing to the state of exchanges, it would consider the advisability of checking such imports. The National Union of Manufacturers,

SOME DRIVER IS PARDEE'S SON!

NOT LONG AGO Peter Pardee, banker, of Reese, Mich., who is well known throughout the "Thumb" of Michigan and in Saginaw and Bay City, left his new Buick coupe standing in front of the bank with the ignition key handy. His son, 8 or 9 years old, is a husky like his father and a "bear" at running things; so when opportunity knocked he grasped the wheel with both hands and took five or six of his boy friends down the road at the rate of 45 miles an hour. When about three miles out, toward Watrousville, the car skidded and turned over. The boys luckily escaped serious injury, but a farmer who came upon the scene right after the accident injected some philosophy into the situation when he pulled up his team and inquired who had been driving the car. Upon being told that it was Pardee's son, he said, "That explains it. Get up!"

149-165 E. Larned St. DETROIT Cadillac 7080

the Association of British Toy Manufacturers and organizations representing manufacturers of dyestuffs and other trades affected by German competition have asked the government to fulfil this promise. The first result of these protests is seen in the passage on December 23, 1920, of the act prohibiting the importation of dyestuffs into Great Britain, except under license, for ten years. No restrictions are placed on dyes imported for re-export.

Agitation against German "dumping" is active in all the former neutral countries. The Stockholm Iron Institute demands that duties be raised as much as 500 per cent, pointing out that German daily wages are about four crowns, Swedish currency, as against a daily wage of almost sixteen crowns in Sweden. The Swedish Electrical industries Association has also petitioned the government, stating that production cost in Germany is between two-fifths and two-thirds that of Sweden. Finland is faced with a similar problem.

Germany is flooding Holland with her industrial machinery, agricultural implements, wrought iron, cutlery, hardware, fancy goods, cotton piece goods, woolen manufactures and certain kinds of foodstuffs. In recent months German exports to Holland have increased to such an extent that the railways and parcel post offices have had great difficulty in keeping up with the work involved. German manufactures are invading the colonies of the Netherlands to such an extent that some branches of the overseas business in Holland are becoming alarmed. This is shown by resolutions passed by the Netherlands Association of Manufacturers, reading in part as follows:

"We observe with great disquietude the business done by Germans in our colonies and it is especially the metal branches which are offering their goods at very low prices. The danger is so great that our own manufacturers are driven from the field and our business will suffer irreparable injury unless quick measures of relief are taken. We apprehend a permanent shrinking of our export industries which will react unfavorably on our domestic situation." This resolution is addressed to the Minister of the Colonies.

In Latin-America

Large and varied consignments have reached South America—particularly Argentina and Brazil—from Germany, recent deliveries including machinery, cutlery, enameled ware, electrical supplies, weighing appliances, musical instruments, fancy goods, stationery, toys, clocks and watches, paints and chemicals. In general, the quality is reported to be as good as before the war. The League of German-Brazilian Firms, with offices at Rio de Janeiro, has recently resumed activities after suspension during the war. Many of the consignments have been in goods of the semi-manufactured variety and in small sundries such as office supplies. Similar reports of German trade activity come from Mexico and Central America.

A small but steady stream of German goods is arriving at Far Eastern ports. The recent arrival in Yokohama of 1,000 casks of German indigo created consternation in the new dye industry in Japan. Prior to the war Japan was supplied almost entirely by Germany. With the cessation of German imports, many dye plants were established, sulphur blue manufactured as a substitute for German indigo. This was made in such quantity that there was a surplus for export to China, but it is stated that the Japanese dyes were inferior in quality. Japan has recently passed a law to prevent "dumping."

A growing volume of imports from Germany is reported from Chinese ports. The consignments are mostly from Hamburg, carried in Japanese vessels, and consist largely of dyes, paper products, buttons, needles, clocks, iron and steel and bottled beer. Germans are undoubtedly well received by Chinese business men, partly on account of the long credits which they are willing to grant. German goods are also entering Egypt in considerable volume, while Egypt is exporting to Germany large quantities of raw cotton.

In the German bid for world trade Russia of course occupies a prominent part. German salesmen are to be found in the most remote parts of Russia renewing connections and making expert investigations. The economic and political condition of Russia renders it quite a fruitful field for German endeavor. Lack of materials and lack of efficient labor have resulted in a severe setback of Russian industries, which has been further intensified by the demoralization of railway transportation. It will be a long time before Russia will be restored to normal conditions and in the meantime the country must have goods. Germany is in a position to supply many lines of small hardware which are urgently needed.

The German Ministry of Foreign Affairs has recently organized a Foreign Trade Bureau to gather and disseminate commercial information. The bureau is governed by a council of thirty members drawn from other government departments. News suitable for immediate publication will be printed daily in the Information for Commerce, Industry and Agriculture. Confidential information will be transmitted to interested persons in special bulletins. The annual subscription for news relating to a special district is 100 marks and for the entire service the subscription is 1,000 marks. German newspapers are supplied with a special service. The Foreign Trade Bureau is now issuing a series of booklets dealing with foreign markets for certain commodities. German diplomatic officers, consuls and commercial attaches are supplied with up-to-date information concerning conditions in Germany.

Business Bills in Legislature

One Measure Revises Workmen's Compensation Upward; Other Proposals; Fight on Lord Bill Seen

[By Staff Correspondent]

LANSING, February 28.—Important amendments to the Michigan workmen's compensation law, creating additional liability on the part of employers, more clearly defining liability for compensation and raising the maximum weekly compensation for injured employes from $14 to $20 a week are included in a bill introduced in the House of Representatives by Rep. George Welsh, Grand Rapids. By the terms of the bill, sub-contractors, if under the compensation law, would be liable for injuries to employes, and if not, the employers would be responsible. All public servants, except elective officials, are also brought under the act, making municipalities, counties, state, etc., liable. This would provide for police and firemen and other public employes. Another change would give $200 in all cases for funeral expenses, while at present dependents must pay these costs out of the compensation received. Additional compensation would also be given in cases of facial and head disfigurements. The jurisdiction of the industrial accident board is made clear to cover cases in which Michigan employes working for a Michigan employer are injured outside the state.

A bill introduced by Rep. William O. Lee, Port Huron, would require the licensing of garages and service stations at $25 annually and would provide that none but an expert mechanic could be employed for intricate repair work on cars in such licensed places. A fine of $100 and imprisonment of 90 days is the maximum penalty for violation.

Sen. Oscar Ripelle, Detroit, introduced a bill which would permit employes at street railways to work but six days a week except in emergencies. Sen. Harvey A. Penney offered a bill regulating the spotlight on cars and the speed they may travel.

Authorization of a new commission to approve or disapprove the sprinkler heads used by factories in this state and to prevent discrimination by insurance companies against plants provided with approved sprinkler heads is provided in a bill introduced by Sen. Arthur E. Wood, Detroit. The members of the board would consist of the insurance commissioner and two members of paid fire departments of Michigan cities, the terms to run for four years.

To reduce theft and dealing in stolen cars, a bill of Rep. Warren D. Byrum would require, under severe penalty, a certificate of ownership, an abstract of title by every automobile owner in Michigan. Penalties for violations would range from a fine not exceeding $1,000 for operation of a car without such a certificate after January 1, 1922, to $5,000 and five years in prison as the maximum for forging such certificates. Every kind of motor vehicle is included, and manufacturers and dealers would be required to furnish such a certificate for every car.

A bill of Rep. Alfred T. Robinson, Saginaw, would compel employers to keep at some work which they might perform employes who had been injured while working for them.

A fight is looked for over the bill of Rep. George Lord, Detroit, on the taxation of foreign securities in the hands of Michigan investors. The bill was passed by the House and is before the Senate. This bill would repeal the present law which places a specific tax of one-half of one per cent on such securities and exempts them from the ad valorem taxes, and would then make such holdings subject to the same general tax as all other property. To entrench himself for the contest Rep. Lord has introduced another bill in the form of a joint resolution providing for an amendment to the constitution which would prohibit the Legislature from enacting any specific tax law in lieu of the general annual property tax as applied to bonds, mortgages and other securities of other states and foreign countries, including municipal and corporation bonds and securities. Mr. Lord says that last year $104,000,000 of Michigan money was invested in such securities and the specific tax paid amounted to only $17,000. On an ad valorem basis they would yield $2,000,000 a year. If the bill fails in the Senate Mr. Lord says he will push his joint resolution for a constitutional amendment which would go to the people. An amendment to the present trust, deposit and securities companies' law, which would bar such concerns from investing in these foreign securities, was introduced also by Mr. Lord.

Representatives of several railroads in the state appeared last week before the Senate railroad committee in opposition to Sen. B. P. Hicks' full crew train bill. The railroads claimed it would add $1,624,000 yearly to their costs without increasing safety or service.

Hearings are also being held on the bill to provide for the eight-hour day in Michigan.

STEPHENSON MILL RESUMES

The I. Stephenson Company's soft wood mill at Wells, near Escanaba, resumed activities February 21 after having been closed since the last week of December. The force taken back is about 200. For the present the mill will be operated on one ten-hour shift, but as soon as conditions warrant more men will be added and two shifts probably will be working.

BURDICK ADDRESSES ENGINEERS

"The Street Railway Situation in Detroit" was the subject discussed at the meeting of the Detroit Engineering Society, held at the Board of Commerce, Friday evening. The speaker was E. J. Burdick, assistant general manager of the Detroit United Railway. The principal feature of the address was the discussion of the "Service at Cost" plan, which the citizens of Detroit will either accept or reject at the election April 4.

The next meeting of the society is scheduled for March 8, when the speaker will be H. C. Lamme, chief engineer of the Westinghouse Electric & Manufacturing Company, Pittsburgh. Mr. Lamme's subject will be, "The History of the Induction Motor."

$2,000,000 LUMBER DEAL

Godfrey Von Platen, Grand Rapids lumberman, has purchased 172,000 acres of timber land in Houghton, Iron, Gogebic, Ontonagon and Keweenaw counties from the James C. Ayres estate, Boston. The consideration is said to have been in the neighborhood of $2,000,000.

PAINTERS CUT OWN WAGES

At a recent meeting of the Ann Arbor painters' union it was announced by Phillip D. Cressor, president, that the painters had voluntarily decided upon a reduction in wages from $1 to 90 cents an hour. Mr. Cressor is quoted as saying that the action was taken because the painters thought that only through such a course generally could the desired reduction in the cost of living be attained.

Michigan Motor Garment Co. Outlook Is Satisfactory

The following letter has been received by this paper from the Michigan Motor Garment Company, Greenville:

"We are pleased to advise you that business conditions with our company have taken a decided turn to the good. The reaction has been just as great as the depression; in fact, we are now oversold on many patterns for at least sixty days. We do not manufacture exclusively for the automobile trade, as we have a very large line of children's play suits that is selling especially well right now. The automobile trade is just beginning to buy again and of course when business is normal we enjoy a very large volume from this source.

"We have sold the Ford Motor Company some goods through its commissary department, but the volume would not keep our factory going for more than a week at a time. All contracts that we have had with this firm have been filled and paid for.

"We are now operating six factories, located at Greenville, Lowell, Carson City, Lakeview, Howard City and Cedar Springs, all in Michigan, and are now planning installing a seventh factory at Edmore. This is the fourth year that our company has been doing business. Even with the business depression of last year, we nearly doubled our sales of the previous year. Prospects are excellent for the future because the reports of our twenty-six salesmen show that inventories are especially low in our line throughout the country."

At the recent annual meeting F. E. Renney was elected president; G. C. Bower, vice-president, and R. M. Beardslee, secretary-treasurer and manager. These officers are J. H. Ritzema, E. A. Kemp, J. S. Gibson and E. W. Ranney make up the board of directors.

JONES HEADS KELLY-SPRINGFIELD

A. B. Jones, former vice-president of the B. F. Goodrich Rubber Company, has been elected president of the Kelly-Springfield Tire Company, succeeding Frederick A. Seaman, who has been acting president and will henceforth be vice-president. The company expects to open its new plant in Cumberland, Md., in the spring and dismantle the present factories at Akron, Wooster and Buffalo. The new plant's main building has 20 acres of floor space and will make possible a daily production of 10,000 tires, 50 per cent more than was possible in the three old factories.

The company in 1920 earned $1,959,293 before deductions for federal income and excess profits taxes, but after taking into consideration preferred dividends. The income thus was equal to $4.01 a share on the outstanding common stock, while in 1919 the net income was equl to $13.20 a share and in 1918 to $20.56 a share. The net before federal taxes in 1919 was $3,148,861; in 1918, $4,283,164 and in 1917, $2,573,751. The balance sheets shows total assets and liabilities on December 31 to have been $36,292,942, as compared with $23,796,029 in 1919; $19,147,995 in 1918 and $15,395,835 in 1917. Assets include $2,182,089 cash; $2,104,359 accounts receivable; $9,751,389 inventories; $21,248,649 properties, patents, etc.; while among the liabilities the principal items are: Preferred stock, $3,237,100; second preferred stock, $5,860,200; common stock, $8,084,241; notes payable, $8,155,969; reserve for depreciation of inventory, $510,535; surpins subject to deduction of federal taxes, $9,365,375.

FORD GRANTED WATER RIGHTS

The Federal Power Commission has approved the application of the Ford Motor Company to develop a $2,500,000 water power project on the Hudson river at Troy, N. Y. The power development is said to be a part of the Ford company's plans to establish a plant at Troy

Sticking to the Facts

(*Continued from Page 8*)

the end of January— there has not been a day when 1,500 cars were made; others say even less, but a few others venture that the 2,000-car-a-day mark has been reached. If it has, so much the better for the thousands of good people who depend on Mr. Ford for their livelihood.

"I am not in favor of exaggerating things, but the Paige-Detroit Motor Car Company is now on a 75 per cent basis and we expect to be on 100 per cent production within another 30 days."

Thus spoke Vice-President F. L. Jewett to the writer, Monday.

"Our business has increased most wonderfully within a comparatively short period, inasmuch as we were on a 25 per cent basis the early part of the year," Mr. Jewett continued. "However, sales have been increasing fast and today we have no more orders on the books for early shipmeot that we are going right ahead further to increase our output. Conditions throughout the country, as our sales force reports, are improving everywhere. Out on the coast, Los Angeles, San Francisco, Seattle and other larger cities, all are in better mood and sending us better reports than for a long time. No doubt the return to full production is not yet general, but there need be no fear, for the industry as a whole is coming back rather strong and it will be a matter of only a few more months before most of us will have forgotten the 'slump days.'"

The Liberty Starter Company, Detroit, which does work for the Ford company exclusively, reopened its plant last week with 150 men—not 750, as had been reported in the newspapers. Every day it is intended to add more, and possibly before the middle of March the total force will be 750, or half the 1920 normal. Company officials have not given out information as to the number of starters they are making for the Ford Company but they point to the fact that they have gone back to work for the Ford company as evidence that activities at the latter plant must be increasing.

"If they were not selling more cars, we would not be back in production today," said one of the officers of the Liberty company.

Production of the Lincoln Motor Company, Detroit, is being increased this month, according to an official, who said:

"We have been producing cars without interruption—only a small number. We have been adding a few men right along, but not hundreds. Because we, as well as other manufacturers know of have not been doing 'big things' for some time, some of the special writers and press reporters seem to have reached the conclusion that Lincoln and these others have been dead idle. That is not only wrong but strictly misleading. There is a difference between small production and no production at all, and mis-statements of that sort under past and present business conditions are sometimes used expressly for no good or honest purposes. We are optimistic here at Lincoln and feel that gradually sales of motor cars will be increasing. The general revival has not yet reached a very high mark, but undoubtedly we are traveling on a much better road than the one we went over during the previous few months."

An average total of 65 to 75 Hudson and Essex cars are being turned out daily by the Hudson Motor Car and the Essex Motors, Detroit.

"We did not close down entirely at either plant," said an official, "and we have been turning out a few cars daily with practically no interruption all of last year and thus far this year. Much that has been rumored and printed in the daily press has been either exaggerated or quite a bit misleading. However, that period is over now, and we feel confident that within a short time business will be very much improved. However, without hard work it can't be done. Talking and suggesting is all very fine but it is up to the sales forces to do it."

Of all the automobile manufacturers in the country, the Reo Motor Car Company, Lansing, is said to be the only one besides the H. H. Franklin Manufacturing Company, Syracuse, N. Y., now on a 100 per cent operating basis, with the leadership in favor of the Wolverine concern owing to its much larger output. The following statement from one of the Reo officials gives the facts:

"We are now operating on 100 per cent basis and shipping about 150 cars a day. Working force is over 5,000 men, and with the exception of a few inefficient men, we kept our whole force all year round. For a comparatively short period the plant was operated on a half-time basis, later increased to three-quarter time. A few days ago we shipped 184 cars one day. Thursday last we shipped 30 to Sweden, thus showing that even foreign business is not a matter of history, at least with us. Production and shipping schedule for the month just ended called for 3,350 Reos, of which 1,800 were trucks and 1,550 passenger cars. This February record is better than the January schedule by 1,350 cars and it is expected that the March activities will likely be better than those of last month. As evidence of the condition which exists now, trainload orders have been received in the last two weeks from Harrisburgh, Pittsburgh, Hartford and Toledo. Trainloads call for 70 to 75 railroad cars carrying 100 to 150 automobiles. Business is also picking up at various points, as for example, Spokane, Wash., which has been quiet, and from where orders for several carloads were received this week.

Another Detroit concern which recently resumed is the C. R. Wilson Body Company. However, as contrary to reports in the press, the reopening was not with a force of 600 men.

"We took back several hundred and expect to have 600 or more on the job ere many days have passed," said a Wilson executive. We are not back to 50 per cent of normal but probably will get there before the end of this month. We have received increased orders from such concerns as Reo, Paige, and Sheridan and the general outlook is much better. The outlook, you understand."

The Motor Specialties Company, Muskegon, has put in a full week of six days since the fall slump and has one-third of its normal force working 10 hours a day.

"Sales made at the automobile shows account for much of the business now on hand," said F. C. Whitney, plant manager. "The company's regular customers have also greatly benefitted by these shows, especially those held in the larger cities, and the result has been that orders long on the books have thus been released. Another encouraging feature is that our experimental and sample department is ahnormally busy for this time of the year. This is undoubtedly due to the fact that many of our customers are taking advantage of the present breathing spell to refine their motors, incorporate new features and test out changes which their engineers have been working on, to improve their product. In this respect the let-up in production may be a good thing for the industry."

In Jackson the Sparks-Withington Company, which makes a variety of automobile accessories, is said to be working with a full force and on one of the largest production schedules. The Briscoe Motor Car Corporation, in the same city, is reported to be increasing its production gradually. As far as is known the production schedule for this year is based on 750 to 1,250 cars a month, with the hope that the total for the year will be 16,000 cars.

Digitized by Google

Nothing definite has been received from the Dort Motor Car Company, Flint, but it is learned from good sources that the company has been receiving many orders for its new models and will increase its output this month.

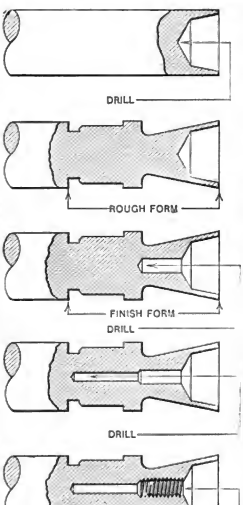
Another indication of the upward trend is to be found in the following announcement of the Curran-Detroit Radiator Company, Detroit:

"We are pleased to report that notwithstanding the abnormal warm weather and general trade conditions, we are enjoying a continued growing demand for our radiators. We continue to receive inquiries from a large number of dealers an auto makers, inquiries coming from Mexico, Alaska, Australia and other foreign countries, thus indicating a growing foreign demand for American goods. We continue to specialize in our patented Ford model, and the reason the Curran factory has been operating full time all winter and has not been handicapped in collections is probably accounted for by the fact that our goods are distributed over a wide territory."

There is no question that the production of the Ford Motor Company is increasing due to growing sales. A variety of reports, some attributed to Henry Ford, have appeared in different papers, and practically every one gives different figures. A number of parts makers or material suppliers for the company, when asked, agreed that they did not believe the production had reached more than 1,500 to 1,800 cars a day. Ford officials couldn't tell, for they didn't know. However, one of the Ford dealers in a Michigan city in an advertisement published in his home town paper starts out as follows: "Less than 2,000 cares a day. * * * The present bedrock prices were based on a 4,000 per day production. We're mighty afraid of an increase most any time."

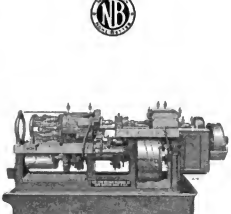
From Akron, O., the tire manufacturing center, comes a report that several of the big concerns recently have received fair sized orders, some of these for the Ford company. An interesting letter on the situation has been received by this paper from the B. F. Goodrich Rubber Company, part of which is quoted:

"It would be impossible for us to give you any information regarding business for 1921 that would be of benefit to you, because whatever we said might be mostly guess-work. It seems to us as if one man's guess is as good as another's. We believe that there will be a marked improvement, but just when it will come and how rapidly it will develop we cannot say.



"We agree with you that there is much misinformation being printed in the press and we thoroughly appreciate your attitude in not printing an item unless it has been officially confirmed. There has been much confusion of names and frequently a distortion of facts."

"It is no exaggeration to say that the automobile industry is at 30 to possibly 35 per cent of normal, taking it as a whole," said one of the officers of the Timken-Detroit Axle Company, Detroit. "Some concerns are doing better than others, but we must consider the thing not from the exceptional standpoint. We hope that conditions will continue to improve. We were more active in February than in January and will be further ahead at the end of March than we were at the beginning of the month. We hope that April will still be better. We cannot tell how much better things will be in 30 or 60 days. Nobody really can, because business conditions in general are still far from normal. Manufacturers all are cautious. It is well known that in very few cases are schedules made with the parts makers for more than a month ahead."



THEIN JOINS SEELYE-BROWN

Robert R. Thein has been made vice-president in charge of service for Seelye & Brown, Inc., Detroit advertising agency. Mr. Thein has been connected with numerous large agencies in the East and had an agency of his own at one time.

The Choice of Those Who Know

Gasoline Engine
Cylinder Primer Body
163 Per Hour

ALMOST THREE A MINUTE! That's the way these priming cups drop from the lair at the W. G. Nagel Electric Co. plant, at Toledo. And work is held within close limits—in spite of this unprecedented rate of output.

The nature and variety of the operations involved practically necessitated the selection of a "Six-Spindle" Automatic for the work. Yet the simplicity of tooling made possible by the greater number of spindles reduces the "down time" to a minimum.

This job is an excellent illustration of the New Britain's ability to accommodate revolving drilling spindles. These may be applied in the 2d, 3d, 4th or 5th positions to speed up small drills, gripping them in chucks and running them against the direction of work rotation. Their use accelerates production, reduces drill breakage, and insures concentricity of hole with outside.

The rapid addition of others, following the installation of a single machine in a plant, is convincing evidence of the *accuracy* and *unequalled productive capacity* of "New Britain" Six-Spindle Automatics—*the choice of those who know.*

We will gladly submit production estimates from samples or blue prints; or, if preferred, our representative will call at your plant to thoroughly investigate the possibilities for increasing production and reducing your costs.

PICKING UP IN LANSING

The New Way Motor Company, Lansing, is receiving orders from all parts of the United States, and Harry J. Sproat, secretary and factory manager, reports that the ouiput has been increased to 40 per cent with 60 men employed. C. C. Carleton, secretary of the Motor Wheel Corporation, announces that this concern is operating on a 50 per cent basis and will go to 75 per cent in March. The corporation began taking back better grade of employes this week. Samuel H. Carpenter, secretary of the Atlas Drop Forge Company, reports his firm as working on an 80 per cent basis and expects to continue at this rate for some months, with 200 men employed and more being added.

CALUMET BODY GIVEN A NAME

Directors of the Calumet Truck Body Company, a concern recently organized, have decided to call their product the Calumet All-Purpose truck body. The company does principally a local business but expects to expand later. At present there are 12 men on the payroll as shop workers. Thus far 15 bodies have been made and there is material on hand for 100 more and additional materials on the way for another 100.

BUICK BRANCH MOVES SALESROOM

The Detroit branch, Buick Motor Company, has moved its salesroom and offices from the Woodward and Alexandrine avenues location to the new General Motors building in West Grand Boulevard. A new service station and parts department building is being erected in Canfield avenue, between Cass avenue and Second boulevard.

GOODYEAR INCREASES PRODUCTION

The Goodyear Tire & Rubber Company, Cleveland, is operating its plant on a five-day schedule, eight hours a day, and the production has been increased to 60,000 tires a week.

BEARINGS SERVICE DIRECTORATE

William N. Sweet has been added to the board of directors of the Bearings Service Company, the other directors being as follows: Heman Ely, Alfred K. Hebner, L. M. Klinedinst, B. G. Koether, Harry J. Porter, Alfred P. Sloan, Jr., and William N. Sweet. Officers elected by the new board are: Alfred K. Hebner, president; L. M. Klinedinst, vice-president; William N. Sweet, vice-president; Dana H. Torrey, secretary; William A. Brooks, treasurer. Main offices of the company are in Detroit.

CHANDLER SHARES EARN $15

A preliminary statement as to the business of the Chandler Motor Car Company, Cleveland, for 1920 shows the net profit to have been $4,213,111, after allowances for taxes and depreciation. This was equivalent to a little better than $15 a share on the 280,000 outstanding shares of stock. The earnings, or rather operating profit, before allowances was $7,543,204. From this there was deducted $2,428,250 for federal income and excess profit taxes; $736,139 for depreciation of inventory to conform with market prices, and $165,702 as loss on sale of government bonds.

THE YEAR HAS ONLY START[ED]

The automobile dealers of Pontiac held a meeting and banquet a few days ago and the opinion of the speakers was that the general outlook was good and that there would be plenty of sales this year.

"Why, 1921 has just started," said one man, "and some people would make you believe that we are already near December 31. Business is only beginning and there is no need for the live dealer, the worker, the business-getter to think that he will not be able to sell cars this year." President E. B. Hodges said much was to be expected from the farmers this year.

HELM'S COMMENT ON BUSINESS

In addressing the members of the Exchange Club, of Cadillac, a few days ago, C. J. Helm, secretary of the Acme Motor Truck Company, said, according to the Cadillac News:

"The industrial outlook in the East is much better than it was 60 days ago. The mere fact that the men with whom I talked while in the

East only a few days ago were not commenting on general conditions impressed me favorably. Two months ago everyone was wondering if the bottom had been reached and generally speculating on the turn affairs would take. In November and December our agents were very quiet without even inquiries as to business coming in. But their mental attitude is much different now and they are hustling for business. They are not discussing conditions; they are meeting them."

VICTOR RUBBER PERSONNEL CHANGES

H. S. Berlin, division plant manager of the Firestone Tire & Rubber Company, Akron, has been elected president of the Victor Rubber Company, Springfield, O. Allard Smith, vice-president of the Union Trust Company, of Cleveland, was elected a member of the board of directors. H. H. Durr, of the financial department, was elected secretary, and A. L. Felck, until recently with the Dunlop Tire & Rubber Company, Buffalo, N. Y., was appointed manager of the sales promotion and advertising department.

SCHWARTZ TRUCK IN PRODUCTION

The Schwartz Motor Truck Corporation, Reading, Pa., is now in production. A single model, known as the Schwartz Highway Express, capacity 1,500 to 2,500 pounds, and selling at $1,485, is being made.

REFINANCING PORTAGE RUBBER

Stockholders of the Portage Rubber Company, Barberton, O., will form a permanent committee to take care of the refinancing of the concern, according to a report from Akron. It is said that probably not over $1,500,000 is involved.

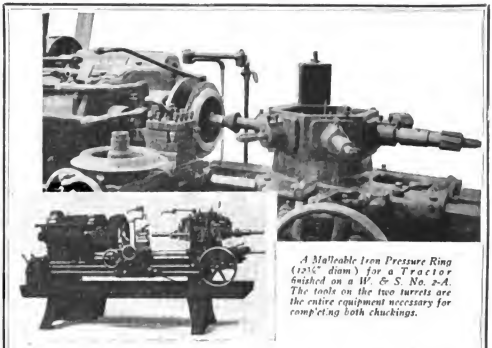
GOODYEAR GETS MORE TIME

Arrangements have been perfected, says the Cleveland Plain Dealer, for a 30-day extension of the $15,830 inventory loan of the Goodyear Tire & Rubber Company, Akron, with an option for a further extension of 60 days.

FOUNDRY ON 40% BASIS

The Gerson-Carey Company, Lansing, is operating its foundry at about 40 per cent of normal engaged on Reo Motor Car Company work. The company makes a specialty of brass castings and brass work.

U. S. MOTOR REGISTRATION



Some idea of the sale of motor cars in 1920 is furnished by the report of the American Automobile Association, to the effect that the registration of 8,234,490 passenger cars and 946,826 trucks in that year was 2,114,670 more than in 1919. Motorcycle registration was 271,230.

THE BIGGEST DEALER "AD"

The Hubbell Auto Sales Company, Saginaw, ran a five-page advertisement in the Saginaw News Courier's special show issue. This is not only the largest single advertisement ever placed by any business firm in Saginaw, so far as is known, but is believed to be the largest single "ad" ever run by any automobile dealer in Michigan. The company handles the Ford products in Saginaw and six adjoining counties and has a branch in Bay City. During 1920 the company's business in the latter county totaled $624,131 and in its Saginaw territory sales amounted to $1,839,811.

EMPLOYES DECIDE TIME POLICY

After having been closed for several weeks, the plant of the Albion Bolt Company, Albion, is again in production. A full force has been taken back and is working three days a week for the present. It is expected that within a few weeks the time schedule will be increased. The plan adopted was the result of an investigation made among the employes, representatives of whom suggested that it would be better for all concerned, to take back all the men to work only half a week than 50 per cent of the force on a full time basis.

A Malleable Iron Pressure Ring (12½" diam.) for a Tractor finished on a W. & S. No. 2-A. The tools on the two turrets are the entire equipment necessary for completing both chuckings.

Be Ready for Increasing Business

Remember there are no obligations attached to the engineering services we offer you. If we cannot help you we tell you so. But—we have helped others to increase the earning capacity of their turret lathe equipments and are ready to try to help you if you wish.

We've had forty years experience making and tooling turret lathes to satisfy unusual demands. Draw on our experience and be ready for the business increases which are bound to come soon.

Write us and we'll send an engineer to consult with you, or send us blueprints and samples of your work for estimate.

TRANSPORTATION NEWS

Rail :: Commercial Hauling :: Water

Chicago—An $11,000,000 ship concern to be known as the Petoskey Transportation Corporation has been organized and a charter filed at Dover, Del. The corporation will establish a freight-carrying service on the Great Lakes, transporting coal, stone and cement principally, and will build three boats immediately, it is announced. John C. Huckbee, Chicago; Albert D. Kilze, Petoskey, and Jonathan B. John, Newago, are three of the promoters.

Detroit—G. W. Eckerle, who has been assistant to the president of the Detroit, Toledo & Ironton Railroad, has resigned to become private secretary to Frank H. Alfred, president and general manager of the Pere Marquette.

Washington—The Interstate Commerce Commission (investigation and Suspension Docket No. 1235) has found that the proposed cancellation of certain specific rates on saw logs and bolts from points on the Chicago, Milwaukee & St. Paul Railway and the Wisconsin Northern Railway in northern Wisconsin and Michigan to Wisconsin points, when for manufacture and reshipment via lines of the respondent, are justified, and has vacated the orders of suspension to that extent. The proposed cancellation of joint rates from points served by the Copper Range and Mineral Range railroads have been found not justified and the proposed schedules have been ordered canceled. The case was submitted on January 20, and decided February 9, 1921.

Detroit—The Grand Trunk Western Railway has leased the Dodge Brothers building, Jefferson avenue and Brush street, for offices. The headquarters of the company formerly were in Montreal, but were moved to Detroit during the war. The building, which is seven stories high, is being altered.

WARNER BUYS VAN SICKLEN

An important event in the automotive industry is the announcement of the Stewart-Warner Speedometer Corporation, Chicago, that it has purchased the Van Sicklen Speedometer Company, Elkin, Ill., one of the largest manufacturers of speed indicating and other automobile devices in the country. The deal involves close to $1,000,000, as far as could be learned from non-authoritative sources. Stewart-Warner also announces that it has sold to the Central Trust Company of Illinois, Chicago, and Hambleton & Company, New York, $2,000,000 of five-year, 8 per cent convertible debenture bonds for the purpose of providing the purchase price of the patent rights and certain assets of the Van Sicklen Company, and also to retire $200,000 of bank loans and provide additional working capital. According to the Chicago Herald-Examiner, the Van Sicklen company is to retain its corporate existence.

GRAND RAPIDS TIRE

The Grand Rapids Tire & Rubber Corporation, Grand Rapids, incorporated in 1920, announces that the first unit of its plant at Fuller avenue and the Grand Trunk has been completed and that it is expected that 400 persons soon will be employed. It is planned to produce 1,000 tires and 5,000 tubes a day. The concern is capitalized at $1,000,000. L. A. Brown, former western sales manager for the United States Rubber Company, is president, and M. J. Goldner, who was branch manager for United States Rubber, secretary-treasurer. H. H. Swan, production manager, formerly was with the Portage and Goodyear tire companies.

GOOD ORDER FOR GILLETT

Important additional orders have been received by the Gillett Motor Products Company, Howard City. These orders, which are said to total approximately $750,000, are for such products as bodies, floor and running boards, automobile dashes and instrument boards. They will necessitate additional manufacturing space, more men and more capital, it is reported.

TWO MICHIGAN SHOWS

The annual Grand Rapids Automobile show, held last week, may be considered the best in the history of the Furniture City. Former attendance records were passed by a large margin. Delegations of dealers as well as prospective buyers came from several other cities, such as Kalamazoo, Muskegon and Battle Creek. From Detroit there came a number of the bigger distributors, while factory representatives from several of the manufacturing concerns were present. Sales are reported to have been made in plenty, both as to passenger cars and trucks. One of the assistant sales managers of a Michigan concern is quoted as saying: "The large attendance was expected, but what is more important and pleasing is the actual number of real prospective buyers on the notebooks of salesmen."

Saginaw also had its annual automobile show the past week and from what dealers said it was entirely satisfactory, everything considered.

LOWER IRON ORE PREDICTED

According to mining men, iron ore prices on 1921 delivery will be cut 75 cents to $1 below the basis of last season, says the Bessemer Herald. It is also contended, adds the paper, that the lake transportation companies must be prepared to make lower rates for the carrying of ore from the Lake Superior ports to the Lake Erie docks in the event of the season's ore prices being reduced.

A CORRECTION

In the February 19 issue of the Michigan Manufacturer and Financial Record it was stated that J. W. Wilford, of Lansing, had been called to Detroit to become general manager of the Central Forge Company. This was a misstatement of fact. Mr. Wilford, who has been identified with Lansing industries for 14 years, was appointed general manager of the Central Gear Company, Detroit. Both the gear company and forge concern are subsidiaries of the General Motors Corporation.

TO ORGANIZE TRUCKMEN

The National Team & Motor Truck Owners' Association will meet in Lansing about the middle of March to begin a campaign to organize territory in Michigan not now embraced in the organization. F. L. Henk, secretary of the Association, with headquarters in Detroit, was in Lansing last week to make preparations for the meeting.

Among the American manufacturers of brushes who have petitioned Congress for a higher tariff on brushes is the Grand Rapids Brush Company. Unequal competition in the business is due principally to Japanese firms, it is said. It is asked that the present duty of 25 per cent ad valorem be raised to from 40 to 60 per cent, according to the different kinds of brushes.

Germany Regaining Her World Trade

(Continued from Page 13)

All the firms and associations engaged in foreign trade were recently welded together into one great organization known as the Association of German Export Firms, with headquarters in Berlin. This organization includes manufacturing and shipping. One of the most important activities of the Association has been the classification of export markets for machinery and engineering products into two categories—those engaged in operations in which the competition of the United States and Great Britain is likely to be negligible and those in which the competition is expected to be keen. In the first classification the German plan is standardization and simplification of all machines and tools, and for the latter a policy of shaping output to meet the exact needs of individual markets. While Germany lacks raw materials and her labor is not yet as efficient as in pre-war days, industrial plants are being operated to their utmost capacity by the systematization of every process and by the amalgamation of allied lines to an extent never before attempted.
